CO2: Show the rise of Nationalism, Imperialism, colonialism, Revolution and Counter Revolution (Understanding)

CO3: Identify the various causes and consequences of World Wars, Power Blocs, Non-alignment and End of Colonial Rule (Applying)

CO4: Identify the factors constraining Development, unification of Europe, disintegration of Soviet Union and rise of unipolar world. (Applying)

Module I: Enlightenment, Origins of Modern Politics and Industrialization (15 Hours)

- Enlightenment and Modern ideas: Major ideas of Enlightenment: Kant, Rousseau; Spread of Enlightenment in the colonies; Rise of socialist ideas (up to Marx); spread of Marxian Socialism.
- Origins of Modern Politics: European States System; American Revolution and the Constitution; French revolution and aftermath, 1789-1815; American Civil War with reference to Abraham Lincoln and the abolition of slavery; British Democratic Politics, 1815-1850; Parliamentary Reformers, Free Traders, Chartists.
- Industrialization: English Industrial Revolution: Causes and Impact on Society; Industrialization in other countries: USA, Germany, Russia, Japan; Industrialization and Globalization.

Module II: Nation-State System, Imperialism and Colonialism and Revolution & Counter-Revolution (15 Hours)

- Nation-State System: Rise of Nationalism in 19th century; Nationalism: state-building in Germany and Italy; Disintegration of Empires in the face of the emergence of nationalities across the world.
- Imperialism and Colonialism: South and South-East Asia; Latin America and South Africa; Australia; Imperialism and free trade; Rise of neo-imperialism.
- Revolution and Counter-Revolution: 19th Century European revolutions; The Russian Revolution of 1917-1921; Fascist Counter-Revolution, Italy and Germany; The Chinese Revolution of 1949

Module III: World Wars; Post World War II & Liberation from Colonial Rule (15 Hours)

- World Wars: 1st and 2nd World Wars as Total Wars: Societal implications; World War I: Causes and consequences; World War II: Causes and consequence
- The World after World War II: Emergence of two power blocs; Emergence of Third World and non-alignment; UNO and the global disputes.
- Liberation from Colonial Rule: Latin America-Bolivar; Arab World-Egypt; Africa-Apartheid to Democracy; South-East Asia-Vietnam

Module IV: Factors Constraining Development, Unification of Europe, Disintegration of Soviet Union and Rise of Unipolar World (15 Hours)

- Factors constraining development: Latin America, Africa
- Unification of Europe: Post War Foundations: NATO and European Community; Consolidation and Expansion of European Community; European Union.
- Disintegration of Soviet Union and the Rise of the Unipolar World: Factors leading to the collapse of Soviet communism and the Soviet Union, 1985-1991; Political Changes in Eastern Europe 1989-2001; End of the cold war and US ascendancy in the World as the lone superpower.

Suggested Readings

1. A Short History of the World, H.G. Wells, Fingerprint Publishing, 2015
2. Mastering Modern World History, Norman Lowe, Palgrave Master Series (2013)
3. History of the World, Arjun Dev and Indira Arjun Dev, Orient Blackswan (2009)
4. History of the Modern World, Dr. Hukam Chand Jain, Jain Prakashan Mandir (2022)
5. A History of the Modern World: An Outline, Ranjan Chakrabarti, Primus Books (2013)

SKILL ENHANCEMENT COURSES

Semes-ter	Category	Course Code	Course Name	Credits
1	S E Course 1	PAOH106L	Office, Home Management and Secretarial practice	3
2	S E Course 2	PACO107L	Corporate Communication	3
3	S E Course 3	PAES209L	Ethics & Self Awareness	3

PAOH106L: OFFICE, HOME MANAGEMENT AND SECRETARIAL PRACTICE

(3 Credits – 15+30 Hours) (L-T-P: 1-0-2)

Course Outcomes

At the end of the Course, students will be able:

CO1: To demonstrate the functioning of the office management, filing and indexing systems, secretarial practices, and meeting procedures. (Understanding)

CO2: To acquire Proficiency in using tools and techniques in office management, filing, and indexing systems and secretarial practices. (Applying)

Module I: Theory (15 Hours)

Modern managerial tools for office management; Modern office record management; Modern filing and indexing systems; Modern Secretarial practices and meeting procedures.

Module II: Practical (30 hours)

The practice of modern managerial tools for office management; The practice of modern office record management; The Practice of modern filing and indexing systems; Practicing Data Entry Operations and Typing; Organising mock organisational meetings: preparation of notices and correspondences, agendas, Resolutions, Minutes, and confirmation of the Minutes and holding meetings.

Suggested Readings

1. Hislop, Donald, Rachele Bosua, and Remko Helms. *Knowledge management in organizations: A critical introduction*. Oxford University Press, 2018.
2. Shark, Alan R. *Technology and public management*. Taylor & Francis, 2022.
3. Read, Judith, and Mary Lea Ginn. *Records management*. Cengage Learning, 2015.

4. Smith, Kelvin. *Public sector records management: A practical guide*. Ashgate Publishing, Ltd., 2007.
5. Chowdhury, Gobinda G. *Introduction to modern information retrieval*. Facet Publishing, 2010.
6. Price, Leah. *Literary secretaries/secretarial culture*. Routledge, 2017.

PACO107L: CORPORATE COMMUNICATION

(3 Credits – 15+30 Hours) (L-T-P: 1-0-2)

Course Outcomes

At the end of the Course, students will be able:

CO1: To demonstrate skills in modern corporate communication. (Understanding)

CO2: To acquire Proficiency in using modern tools and techniques in corporate communication (Applying)

Module I: Modern corporate Communication tools: (15 Hours)

Social intranet, all-in-one employee communication tools, Task/ project management software and tools, Instant messaging, Newsletters, Voice & video conferencing tools (like Cisco Webex Meetings, Go To Meeting, ZOOM; SKYPE, Google Meet, and Microsoft Teams), Document collaboration tools (like Google Workspace), ERP, Knowledge centre tools, File sharing tools, Employee directory software, Internal blogs, videos & updates, Analytics, Discussion forums, Email management tools, Communication tools for the social media content (like Buffer or Hootsuite).

Module II: Practical (30 Hours)

Practising Modern Corporate Communication tools

Suggested Readings

1. Wrench, Jason S., ed. *Workplace communication for the 21st century: Tools and strategies that impact the bottom line*. ABC-CLIO, 2013.
2. Patterson, Kerry, et al. *Crucial conversations tools for talking when stakes are high*. McGraw-Hill Education, 2012.
3. Sullivan, Jay. *Simply said: Communicating better at work and beyond*. John Wiley & Sons, 2016.
4. Fine, Debra. *The Fine Art of Small Talk: How to Start a Conversation, Keep It Going, Build Networking Skills--and Leave a Positive Impression!*. Hachette UK, 2023.

PAES209L: ETHICS AND SELF AWARENESS

(3 Credits – 15+30 Hours) (L-T-P: 1-0-2)

Course Outcomes:

At the end of the Course, students will be able:

CO1: To demonstrate knowledge of Ethics and Self Awareness. (Understanding)

CO2: To Make Use of Skills and values in the practice of Ethics and self-awareness. (Applying)

Module I: Introduction - Ethics and Self-Awareness (15 Hours)

Ethical theories; Moral principles and strategies for weighing competing values and interests; Essence, determinants, and consequences of ethics in-human actions; Self-awareness – techniques

Module II: Practical (30 Hours)

Ethics Tournaments; Signing Honour Codes; Self-awareness – activities

Suggested Readings

1. Singer, Peter. *Practical ethics*. Cambridge University Press, 2011.
2. Thompson, Mel. *Understand Ethics: Teach Yourself: Making Sense of the Morals of Everyday Living*. Hachette UK, 2010.
3. Rachels, James, and Stuart Rachels. *The Elements of Moral Philosophy 7e*. McGraw-Hill, 2012.
4. Tugaleva, Vironika. *The art of talking to yourself: Self-awareness meets the inner conversation*. Soulux Press, 2017.
5. Holiday, Ryan. *Ego is the Enemy*. Elex media komputindo, 2019.
6. Williams, Ron. *Learning to lead: The journey to leading yourself, leading others, and leading an organization*. Greenleaf Book Group, 2019.

4	Internship	PAIN212I	Internship	4
5	Internship	PAIN311I	Internship	2

PAIN109I/PAIN212I: INTERNSHIP (Exit of 1st Year or 2nd Year)

(4 Credits: 120 Hours)

The student will carry out a field Internship as per the need of the Organization with a specific Objective since he or she will exit after 1st year or 2nd Year of UG Programme. The Internship will be of 1 month duration with follow up of the supervisors allotted as per as specialization. The student will need to sort out the Organisation with due permissions of the Department/University authorities and submit a preliminary plan for approval. The plan of activities undertaken during the Internships would be areas related to Public Administration, Public Policies, Rural Development, Urban Development etc with specific objectives and Mission and Vision of the Organisation. The student will submit a final report of the Internships with supportive documents and signature of the Organization where he/she has undertaken the Internships within 10 days after the Internship is over.

Time duration: 1 Month/30 days

Final Report: Within 10 days after the Internship is over (Hard Copy in Hard/Spiral Bound), 30-40

Pages

Marks: 100

PAIN311I: INTERNSHIP (At the end of 4th Semester and evaluated in 5th Semester)
(2 Credits-60 Hours)

The student will carry out a field Internship as per the need of the Organization with a specific Objective at the end of the 4th Semester and Evaluated in the 5th Semester of UG Programme. The Internship will be of 1 month duration with follow up of the supervisors allotted as per as specialization. The student will need to sort out the Organization with due permissions of the Department/University authorities and submit a preliminary plan for approval. The plan of activities undertaken during the Internships would be areas related to Public Administration, Public Policies, Rural Development, Urban Development etc with specific objectives and Mission and Vision of the Organisation. The student will submit a final report of the Internships with supportive documents and signature of the Organization where he/she has undertaken the Internships within 10 days after the Internship is over.

RESEARCH PROJECT /DISSERTATION

BA PUBLIC ADMINISTRATION (Honours)				
Semester	Category	Course Code	Course Name	Credits
7	Research Project/Dissertation	PCDI409P	Research Project Phase I	6
8	Research Project/Dissertation	PCDI410P	Research Project Phase II	6
BA PUBLIC ADMINISTRATION (Honours) with Research				
Semester	Category	Course Code	Course Name	Credits
7	Research Project/Dissertation	PCDI411P	Dissertation I	18
8	Research Project/Dissertation	PCDI412P	Dissertation II	20

BA PUBLIC ADMINISTRATION (Honours)

PADI408P: Research Project Phase I
(6 credits – 180 hours) (L-T-P: 0-0-12)

The Research project is divided into two phases, taking place during Semester VII and Semester VIII, known as Research Project Phase-I and Research Project Phase-II, respectively. The primary objective of this course is to enhance students' independent critical thinking abilities and improve their oral and written communication skills by incorporating a research project alongside a strong academic foundation. The research project aims to achieve valuable learning outcomes with long-term impacts, preparing undergraduates for their future professional endeavours.

During the first phase of the research project, students are required to select a suitable study topic within their area of specialization. They must effectively articulate and formulate a research question related to their chosen topic. Additionally, students need to gather relevant literature pertaining to their research topic and,

if applicable, develop research hypotheses. Proper planning of the research design is essential, including considerations for sampling, observational, statistical, and operational designs.

PADI409P: Research Project Phase II
(6 credits – 180 hours) (L-T-P: 0-0-12)

The Research project spans across two semesters, Semester VII and Semester VIII, referred to as Research Project Phase-I and Research Project Phase-II, respectively. In Phase-I, students select a research topic and begin their work. Phase-II serves as a continuation of Phase-I, where students refine their research project and prepare it for presentation.

During Phase-II, students are required to compile relevant data, analyze and interpret it, and, if applicable, test any hypotheses. By analyzing and interpreting the collected data, the student (researcher) will draw logical conclusions and propose appropriate recommendations for the research problem. The final outcome should be a well-structured project report that the students will defend in front of a panel of examiners.

BA PUBLIC ADMINISTRATION (Honours) with Research

PADI410P: DISSERTATION I
(18 Credits -540 Hours) (L-T-P: 0-0-36)

The students will have to submit a dissertation, which will be assessed by External Examiners appointed by the University. The dissertation work will be spread over two semesters, namely Semester VII and Semester VIII, referred to as Dissertation Phase-I and Dissertation Phase-II, respectively. The total dissertation carries 38 credits, with 18 credits assigned to Semester VII and 20 credits to Semester VIII.

The main objectives of the course are to enhance students' presentation skills and develop their academic writing abilities. Additionally, the course aims to enable students to apply the statistical research training they have received during the taught portion of the program. This application will involve designing an appropriate research strategy and methodology to conduct their research.

During Dissertation Phase-I, students are expected to come up with a research idea independently. By the end of Semester VII, they must defend a research proposal based on this idea, presenting it as a Synopsis.

Structure of Dissertation Phase-I

Sl. No.	Tentative Stages to be completed
1.	Research idea or concept note, i.e., Statement of the Problem
2.	Review of Literature
3.	Research Methodology Sampling, Sample size determination, Selection of sample, Analytical tools to be used, Questionnaire preparation, Preliminary exploration of data, i.e. Pilot Survey
4.	Synopsis Presentation Submission of Modified Synopsis to the Department
5.	Students have to collect all the required data during the semester

PADI411P: DISSERTATION II
(20 Credits -600 Hours) (L-T-P: 0-0-40)

The students need to submit a dissertation, which will be evaluated by External Examiners chosen by the University. The dissertation work will be divided into two phases: Dissertation Phase-I in Semester VII and

Dissertation Phase-II in Semester VIII. These phases account for a total of 38 credits, with 18 credits in Semester VII and 20 credits in Semester VIII.

The primary objective of the course is to refine the students' dissertations during Phase-I, while also teaching them how to apply statistical and scientific tools to their research. They will also learn research ethics. In Dissertation Phase-II, the students will conduct data analysis, write the dissertation, and defend it before the end of the semester.

The dissertation must encompass original research questions (if any), a critical review of relevant literature, use of analytical tools to address the research questions, data analysis, and interpretation. Following all guidelines provided by the University, the students must submit the completed dissertation. Throughout this process, the students will receive guidance from a designated supervisor from the department.

Structure of Dissertation Phase-II

Sl. No.	Tentative Stages to be completed
1.	Validation of data, data entry and preliminary analysis of data (drawing graphs, trend lines, making tables, etc.)
2.	Main data analysis and interpretation
3.	Dissertation writing, Proof reading, and Plagiarism checking
4.	Submission and Viva Voce

VALUE ADDED COURSES

DEPARTMENT OF PUBLIC ADMINISTRATION

PACS0022: CIVIL SERVICE IN INDIA

Credits: 3 (45 lectures) (45 Hours)

Course Outcomes

At the end of this course, students are able to:

1. Understand the Concept, Significance and Evolution of Civil Services (Remembering & Understanding)
2. Understand the Concept of Bureaucracy and its historical evolution (Understanding)
3. Analyze the Changing Nature of Public Services (Analyzing)
4. Evaluate the Civil Services in the context of Globalisation (Applying)

Module I (10 hours) Civil Services:

Concept, Significance and Evolution of Civil Services; Classification of Civil Services (All India Services, Central Services, State Services and Local Services); Union Public Service Commission and Other Service Commissions

Module II (10 hours) Bureaucracy:

Concept of Bureaucracy – Historical Evolution; Civil Service: Neutrality and Commitment; Relationship between Politicians and Civil Servants

Module III (10 hours) Public Personnel Administration:

Recruitment; Methods and Significance; Training of Public Servants in India- Promotion System in India; Disciplinary Procedure for Civil Servants

Module IV (10 hours) Civil Services-Citizenry Interface:

Civil Society and Administration; Technology and Changing Nature of Public Services; Ethics and Accountability

Module V (05 hours) Indian Civil Services:

Major Issues - Generalists and Specialists Controversy, Civil Services in the context of Globalisation, Civil Service Reforms- IInd ARC Recommendation

Suggested Readings

1. P. N. Parashar- History and Problems of Civil Services in India
2. Yogendra Narain- Civil Services: Challenges And Resolutions
3. Abhay Prasad Singh & Krishna Murari - Constitutional Government and Democracy in India
4. S.K. Das - The Civil Services in India
5. Lohit Matani, Vishal - An Introduction to Civil Services
6. S.N. Singh - Politician Civil Servant Relationship and Public Administration in India
7. Sandeep Sharma- Indian Civil Service and Public Administration

PAIG0023: INNOVATION IN GOVERNANCE

Credits: 3 (45 lectures) (45 Hours)

Course Outcomes

At the end of this course, students are able to:

1. Understand the Institutional Framework for Promoting Innovations (Remembering & Understanding)
2. Understand the Methodological Approach for studying best Practices (Understanding)
3. Analyze the Innovations in Public Services (Analyzing)
4. Evaluate the role of Citizen Participation in Government Innovations. (Applying)

Module – I (10 hours) Innovations in Governance:

Meaning of innovation in governance; Perspectives and Challenges; Characteristics and Patterns of Innovations; Institutional Framework for Promoting Innovations; Public Governance and Innovations: Administrative Reform to Innovation Discourse

Module – II (10 hours) Understanding Innovations:

Innovation for Achieving a Quality of Life, Methodological Approach for Studying Best Practices, Capacities for Innovation and Best Practices

Module – III (10 hours) Innovations in Public Services:

Recent trends; Innovation Capacity in Organizations; Leadership and Innovation; Innovations in different sectors: General Administration, Urban Administration, Health Administration, Private Sector, Agriculture, etc

Module – IV (10 hours) Transferability of Best Practices and Innovations:

The Ombudsman against Corruption, Technology and Changing Nature of Organizations, Best Practices of Knowledge Management Framework, Diffusion of Innovation in a Development Context

Module – V (05 hours) Issue Areas:

Originality and Replication of Innovations; Innovation with or Without Improvement; Citizen Participation in Government Innovations; Research in Innovative Governance

DEPARTMENT OF PHILOSOPHY

PROGRAMME: BACHELOR OF ARTS in PHILOSOPHY (BA) Degree: BA PHILOSOPHY (HONOURS) MINORS IN ENGLISH AND PSYCHOLOGY

VISION:

To be a centre of excellence in teaching, learning, and research that is committed to moulding ethically and socially responsible graduates with deeper knowledge about God, the world, and the human person in his or her social setting, which is religiously, culturally, economically, linguistically, and ethnically diverse.

MISSION:

The Department of Philosophy seeks to:

Promote critical thinking by training students to analyse, evaluate, and interpret societal events, which aims at the integral development of students.

Search for and find true values and meanings with a coherent and cogent exposition of one's philosophical convictions.

Provide the students with a worldview that ensures a holistic vision of reality by engaging them with the multi-cultural and multi-linguistic traditions of northeast India and its people.

Inculcate among the students true human values that promote and appreciate each other's differences.

PROGRAMME OUTCOMES (PO)

- PO 1: **Critical Thinking:** Choose informed actions after identifying the assumptions that frame our thinking and actions, checking out the degree to which these assumptions are accurate and valid, and looking at our ideas and decisions (intellectual, organisational, and personal) from different perspectives.
- PO 2: **Effective Communication:** Speak, read, write, and listen clearly in English and one Indian language, and make meaning of the world by connecting people, ideas, books, media, and technology.
- PO 3: **Social Interaction:** Discuss the views of others, mediate disagreements, and help reach conclusions in group settings.
- PO 4: **Effective Citizenship:** Demonstrate empathetic social concern and equity-centred national development, as well as the ability to act with an informed awareness of issues and participate in civic life through volunteering.
- PO 5: **Ethics:** Analyse different value systems, including your own, understand the moral dimensions of your decisions, and accept responsibility for them.
- PO 6: **Environment and Sustainability:** Assess the issues of environmental context and sustainable development. PO 7: **Self-directed and Life-long Learning:** Develop the ability to engage in independent and life-long learning in the broadest context of socio-technological changes.
- PO 7: **Enhancing Abilities and Skills:** To acquire hands-on competence in skills and abilities that will enhance the learning process.

PROGRAMME SPECIFIC OUTCOMES (PSO)

- PSO 1: **Demonstrating Comprehensive Acquaintance with the Subjects:** To explain and analyse with alacrity the various issues in philosophy, English, and psychology.
- PSO 2: **Developing Philosophical Thinking:** To assess the thoughts and writings of different philosophers, psychologists, and literary writers, both Western and Indian, analytically.
- PSO 3: **Building a Multi-disciplinary Worldview:** To develop familiarity with knowledge of concepts and notions regarding disciplines other than philosophy, English, and psychology.
- PSO 4: **Creating Social and Cultural Sensibilities:** To appraise and estimate the complexities of the social and cultural sensibilities of people by engaging in a variety of philosophical discourses.

PYAM100T: ANCIENT AND MEDIEVAL WESTERN PHILOSOPHY

(4 Credits – 60 Hours)

Course Objectives

The course intends to expand the discursive and reasoning skills of the students. It assists the students in their development of problem-solving experience in at least one of the main areas of philosophy. Ancient Greek Philosophy arose in the 6th century BCE and its influence is noticed in the later part of continental

philosophy. Alfred North Whitehead would say that the philosophy after Plato is only a footnote to Plato's philosophy. Ancient thinkers have dealt with philosophy, ethics, metaphysics, ontology, biology, logic, rhetoric and aesthetics. Medieval Christian thinkers made use of Greek philosophy to interpret Christian theology and arrive at a coherent Christian philosophy.

Course Outcomes

CO 1: Outlines the basic philosophies of different schools of Greek and Medieval Philosophy (understanding)

CO 2: Analyses the various issues that the Ancient Greek and Medieval thinkers were grappling with (analysing)

CO 3: Develops the techniques for solving problems in at least one of the main areas of philosophy (applying) CO 4: Improves critical thinking and analytical skills (creating)

Module 1: The Origin and Development of Early Greek Thought (10 hours)

The problem of substance: Thales, Anaximander, Anaximenes, Pythagoras

The Problem of Change: permanence and change – Heraclitus and Eleatic School

The Theory of Atomism: Democritus - metaphysics and cosmology, psychology, theory of knowledge, theology and ethics

Module 2: Problems of Knowledge and Conduct (8 hours)

The Age of the Sophists, Socrates, and Socratic School

Module 3: The Age of Greek Systems (15 hours)

Plato: dialectic and theory of knowledge, the doctrine of Ideas, philosophy of nature, the doctrine of immortality, ethics and politics

Aristotle: philosophy and sciences, logic, metaphysics, the four causes, theology, psychology, ethics and politics

Module 4: The Ethical Period (12 hours)

Epicureanism, stoicism, scepticism, Neoplatonism

Module 5: The Rise of Medieval Philosophy (15 hours)

The Patristic Period: Early Fathers of the Church, St Augustine

Scholasticism: meaning, characteristics, faith and reason, John Scotus Erigena, St Anselm, Peter Abelard, The Golden Age of

Scholasticism: St Thomas Aquinas and John Duns Scotus; Nominalism: William of Ockham and Roger Bacon

PYVU103T: VEDIC AND UPANISHADIC PHILOSOPHY

(4 Credits – 60 Hours)

Course Objectives

The course intends to offer the students basic knowledge of the culture, religion, and philosophy of ancient India so that they can have a genuine appreciation of India's rich heritage and be legitimately proud of being Indians. Hence, the course makes a survey of the origin and development of Indian culture, religion, and philosophy from the Indus Valley civilization to the Upanishadic period. The earliest available texts of religion

and philosophy in India are the Vedas. These texts are studied from such different angles as religion, philosophy, scripture and religious experience. A short survey of the principal characteristics of the Brahmanas and Aranyakas introduces an integrated approach to the Upanishads.

Course Outcomes

CO 1: Explains in detail the ancient Indian Scriptures particularly the Vedas and the Upanishads (understanding)

CO 2: Builds a brief survey of the developments of the religion and philosophy of Ancient India (applying)

CO 3: Outlines the Indian traditions, value systems, social life and belief systems (understanding)

CO4: Appraises the philosophy impeded in the Sruti literature (evaluating)

Module 1: Fundamental Beliefs of Hinduism (10 hours)

Cosmic Order (Rta), The Theory of Dharma, The Theory of Karma

The Theory of Rebirth (Punarjanma), The Theory of Liberation (Mukti)

Module 2: Purusharthas, Varnasramas, Asramadharma (10 hours)

Purusharthas: artha, kama, dharma and moksha Varnasramas: Brahmins, Kshatriyas, Vaisyas and Sudras Asramadharma: brahmacarya, grahastha, vanaprastha and sanyasa

Module 3: The Historical Development of the Hindu Philosophy (10 hours)

The Indus Valley civilization The Vedic Age: the Four Vedas

The Brahmanic period, the Aranyaka period and the Upanishadic period

Module 4: Philosophy and Religion of Vedas (10 hours)

The origin and development of the idea of the divine in the Vedas and Upanishads: nature worship, polytheism, henotheism/kathanotheism, monotheism, monism and absolutism

The creation theories in Vedas: Purushasukta (Rig Veda 10. 90), Nasadiyasukta (Rig Veda 10.129), Hiranyagarbhasukta (Rig

Veda 10. 121) and Visvakarmasukta (Rig Veda

10.82) The Theory of Law and Sacrifice (yajna)

Module 5: The Philosophy of the Upanishads (20 hours)

The Principal Upanishads Sreyas and Preyas

The Atman Brahman Identity

Mahavakyas: Tattvamasi, Ahambrahamasmi, Ayamattmabrahma, Sarvamkhalvidam Brahma, The Pancikarana/Trivrittkarana

The Concept of the Human Person

The Concept of Transmigration and Liberation

Four Levels of the Existence of Atman (jagrat, svapana, sushupti and turiya)

Suggested Readings

K.P. Bahadur, The Wisdom of the Upanishads, New Delhi: Sterling Publishers, 1989.

H.D. Griswold, The Religion of the Rigveda, Delhi: Motilal Banarsidas, 1971.

Hiriyanna, Outlines of Indian Philosophy, Delhi: Motilal Banarsidas Publishers, 1993.

PYSI200T: SYSTEMS OF INDIAN PHILOSOPHY

(4 Credits – 60 Hours)

Course Objectives

This paper aims at an in-depth study of the orthodox systems in Indian philosophy, which, on the one hand, provided a philosophical and scientific foundation to the Vedic teachings, and, on the other, developed into independent schools of philosophy. They began to philosophize using human reason as well as revelation to address the perennial questions that confronted them. This was a departure from the traditional exegetical type of doing philosophy.

Course Objectives

CO 1: Outlines the salient features of Indian Classical Philosophy (understanding)

CO 2: Illustrates the philosophies of Nyaya, Vaiseshika, Samkhya, Yoga and Purva Mimamsa (understanding) CO 3: Appraises the contributions of Classical Indian Philosophy to later thinking in India (evaluating)

CO 4: Develops a genuine appreciation for the various philosophical issues Indian Schools (creating)

Module 1: General Characteristics of Indian Philosophy (10 hours)

The unity of moral and spiritual outlook among the systems

Philosophy springs from Spiritual disquiet at the existing order of things Belief in an eternal moral order in the universe The universe as a moral stage

Ignorance as the reason for bondage and knowledge as means to liberation Sadhanas for liberation

Module 2: The Philosophy of Vaiseshika System (10 hours)

Vaiseshika as a system of pluralism, atomism and realism

The Padarthas: substance, quality, action, universal, particular, inherence and negation The theory of atomism The creation and destruction of the universe

Module 3: The Philosophy of Nyaya System (10 hours)

The Theory of Perception: definition of perception, modes of perception, types of perception, types of contact (sannikarsha)

The Theory of Reasoning: terms of inference, limbs of syllogism, types of inference, fallacies Comparison

Verbal Testimony: types of verbal testimony, conditions of meaningful sentence The theory of causality (Asatkaryavada) Proofs for the existence of God

Module 4: The Philosophy of Samkhya (10 hours)

The Theory of Causality (Satkaryavada), The Concept of Prakriti

The Concept of Purusha, The Concept of Gunas, The Evolution of Prakriti, The Concept of Liberation

Module 5: The Yoga Philosophy (10 hours)

Definition and Importance of Yoga, The Levels of the Mind (cittabhumi), The Eight Limbs of Yoga; The Yoga Categories

Module 6: The Philosophy of Early Mimamsa (10 hours)

The Purva Mimamsa: a way of interpreting scriptural texts

The Philosophy of Kumarila Bhatta: theory of cognizedness, theory of anuaplabdhi, theories of svathapramana and partathahaparamana, theory of vivaritakhyati

The Philosophy of Prabhakara: theory of triputi, theory of svathapramana and svatahapramana, theory of akhyati

Suggested Readings

PYMW201T: MODERN WESTERN PHILOSOPHY

(4 Credits – 60 Hours)

Course Objectives

The main objective of this course is to acquaint the students with knowledge about modern Western philosophy, which is marked by the revolt against authority, love for humanism, emphasis on the awakening of the reflective spirit, and demand for freedom of thought, feeling, and action. The students will study the thinkers of this period who refused to accept blindly the dictates of religion and tradition but searched for certain foundations of life and realities. Philosophy is thus based on human reasoning rather than on faith.

Course Outcomes

CO 1: Outlines the salient features of Modern Western Philosophy (understanding)

CO 2: Illustrates the philosophies of Descartes, Spinoza, Leibniz, Locke, Berkeley, Hume, Kant, and Hegel (understanding)

CO 3: Appraises the contributions of Modern Western Philosophy to Contemporary Western Thought (evaluating)

CO 4: Develops a genuine appreciation for the various philosophical issues raised in the modern period (creating)

Module 1: Beginnings of Modern Philosophy (5 hours)

Francis Bacon: reform of science, inductive method, the programme of philosophy, philosophy of man, metaphysics, theology; Salient Features of Modern Philosophy

Module 2: Continental Rationalism (15 hours)

Rene Descartes: Cartesian method, classification of sciences, the criterion of knowledge, proofs for the existence of God, the existence of the external world, body-mind relation and the theory of innate ideas

Benedict Spinoza: rationalism, method, the universal substance, attributes of god, the doctrine of modes, the human mind, ethics and politics; Blaise Pascal: wager argument

Module 3: The British Empiricism (10 hours)

John Locke: origin of knowledge, nature and validity of knowledge, limits of knowledge, metaphysics, ethics, free will and political philosophy

George Berkeley: the rejection of abstract ideas, *esse est percipi*, the world of spirits, knowledge of ideas, spirits, and relations, refutation of dualism, atheism and scepticism

David Hume: the origin of human knowledge, the relation of cause and effect, the validity of knowledge, knowledge of the external world, denial of soul-substance

Module 4: Rationalism in Germany (5 hours)

G W. Leibniz: the doctrine of force, the doctrine of monads, theology, ethics, logic and theory of knowledge
Christian Wolff: Mysticism and Romanticism

Module 5: Critical Philosophy of Immanuel Kant (15 hours)

Kant's problem, the problem of knowledge, the transcendental method, the theory of sense perception, the theory of understanding, the validity of the judgement, unity of self-consciousness, knowledge of thing-in-itself, the impossibility of metaphysics, practical reason, moral theology and ethics

Module 6: German Idealism (10 hours)

Johann Gottlieb Fichte Friedrich Wilhelm Schelling

Georg Wilhelm Hegel: the problem of philosophy, dialectical method, thought and being, logic and metaphysics, philosophy of nature, philosophy of mind, religion and philosophy

Suggested Readings

Frederick Copleston, A History of Philosophy. Vol. I. New York: Image Books, 1985.

Will Durant, The Story of Philosophy. New York: Pocket Books, 1976.

T.Z. Lavine, From Socrates to Sartre: The Philosophic Quest. New York: Bantam Books, 1989.

Archana Roy, Western Philosophy from Descartes to Kant. New Delhi: Gitanjali Publications, 1994.

Bertrand Russell, A History of Western Philosophy. London: Unwin, 1984.

Frank Thilly, A History of Philosophy. Allahabad: Central Book Depot, 1981.

PYCS202T: CLASSICAL AND SYMBOLIC LOGIC

(Credits: 5 – 75 Hours)

Course Objectives

This course introduces students to the fundamentals of deductive, inductive, and symbolic logic. Students will learn basic logical concepts and common argumentative forms, which help them to know the merits of good arguments, recognise their presence or absence in argumentative discourse, and exhibit them in their writing and speech.

Course Outcomes

CO 1: Shows the various modes of arguments both deductive and inductive (remembering)

CO 2: Contrasts the valid and the invalid reasoning in Indian and Western Logic (understanding)

CO 3: Constructs truth tables using symbols (applying)

CO 4: Changes the ordinary language into symbolic language by using the quantification theory (creating)

Module 1: Logic and Language (5 hours)

Introduction – the subject matter of Logic - deduction and induction, function and uses of language - language makes things possible - various functions of language

Module 2: Propositions and Terms (10 hours)

Terms: types of terms, distribution of terms, denotation and connotation of terms, contradictory terms Propositions: traditional

classification of propositions and modern classification of propositions Aristotelian Square of Opposition Immediate Inference: Conversion, Obversion, Contraposition and Inversion

Module 3: Syllogisms (10 hours)

The Three Laws of Thought

Structure of Syllogism - Figures and Moods of Syllogism General Rules of Syllogism - Deductive Fallacy Types of Syllogisms Determination of Valid Moods.

Module 4: Nyāya Logic (5 hours)

Elements of Indian Inference – Terms – Fallacy - Conclusion

Module 5: Methods of Induction (10 hours)

Analogical reasoning, causal reasoning, science and hypothesis, probability, types of induction

Module 6: Introducing Symbolic Logic (10 hours) What is Symbolic Logic?

Truth Functions: negation, conjunction, alternation (or disjunction), conditional (or material implication), bi-conditional (or material equivalence), Sheffer's Stroke function. Interdefinability of different truth functions.

Module 7: Truth Tables (10 hours)

Truth trees method. Alternation (or disjunctive) and conjunctive normal forms as decision procedures. Use of these methods for (a) deciding consistency (contingency), inconsistency (contradiction), and validity (tautology) of propositions. (b) showing implication and equivalence between propositions and (c) showing validity/invalidity of truth-functional argument.

Module 8: Quantification Theory (5 hours)

Syllogistic and the method of antilogism.

Translating Ordinary Language into the Language of Quantification.

PYWP203T: CONTEMPORARY WESTERN PHILOSOPHY

(Credits: 5 – 75 Hours)

Course Objectives

The course provides the students with basic knowledge in the main areas of contemporary philosophy, which were developed in the 19th and 20th centuries in the West. Several traditions of philosophizing sprang up during this period. Without entering into postmodernism, this course familiarizes the students with the thoughts of contemporary Western thinkers.

Course Outcomes

CO 1: Explains the main areas of contemporary philosophy (understanding)

CO 2: Summarizes the life and thought of different philosophers of this period (Understanding)

CO 3: Appraises the human situations of freedom, anxiety, dread and death in the quest for authenticity (evaluating).

CO 4: Improves students' critical thinking and analytical skills (creating)

Module 1: Introduction (10 hours)

Contemporary Western Philosophy

Anglo-American Traditions and Continental Traditions Characteristics of Existentialism

Module 2: Analytic Tradition (10 hours)

Gottlob Frege, Bertrand Russell, Ludwig Wittgenstein

Logical Positivism: Moritz Schlick, A. J. Ayer

Module 3: Phenomenology (10 hours)

Edmund Husserl, Merleau-Ponty

Process Philosophy: Alfred Whitehead

Module 4: Existentialism (15 hours)

Søren Kierkegaard, Martin Heidegger Jean-Paul Sartre

Module 5: Pragmatic Tradition (10 hours)

C. S. Peirce William James, John Dewey W. V. O. Quine

Module 6: Hermeneutic Tradition (10 hours)

Hans-Georg Gadamer, Paul Ricoeur

Module 7: Structuralism and Post-structuralism (10 hours)

Ferdinand de Saussure Levi Strauss

PYPB204T: PHILOSOPHY OF BEING

(Credits: 4 – 60 Hours)

Course Objectives

Among the different branches of philosophy, metaphysics helps students discover the core of philosophical knowledge that influences all other branches. Metaphysics, as the summit of human knowledge in the natural order, plays the role of guiding human knowledge and activity in the light of its basic principles, and the knowledge of the natural order paves the way for the knowledge of the supernatural order. It is the most general and fundamental of all the disciplines. It aims to identify the nature and structure of all there is. Central to this discipline is the explanation of the relationship between Being and beings, of one and many.

Course Outcomes

CO 1: Defines the basic concepts in metaphysics (remembering)

CO 2: Demonstrates the first principles of being and knowing (understanding)

CO 3: Develops the notion of being (applying)

CO 4: Compares the concept of being at various levels of existence (evaluating)

Module 1: Introducing Metaphysics (10 hours)

Etymology, definition and nature of metaphysics; a brief history of metaphysics: Indian and Western; the starting point of metaphysics (10 hours)

Module 2: Notions, Principles, Methods and Categories (10 hours)

Fundamental notions and principles in metaphysics; methods of metaphysics; basic categories: Indian and Western

Module 3: Metaphysical Structure of Finite Being (16 hours)

Being and essence; substance and accidents, matter and form, act and potency

Module 4: Metaphysical Nature of Finite Being (8 hours)

Supposit and person; spirituality and immortality of the person

Module 5: Metaphysical Properties (8 hours)

Modes of Being: analogy of being; transcendentals: oneness, truth, goodness and beauty

Module 6: Metaphysical Problems (8 hours)

The problem of one and many; the problem of evil

Suggested Readings

Ando Takatura, Metaphysics: A Critical Survey of its Meaning, The Hague: Martinus Nijhoff, 1963.

Henry J. Koren, An Introduction to the Science of Metaphysics, London: Herder Book Co. 1960.

M. Hiriyanna. The Essentials of Indian Philosophy, Bombay: Blackie and Son, 1973.

PYPK300T: PHILOSOPHY OF KNOWLEDGE

(Credits: 5 – 75 Hours)

Course Objectives

The philosophy of knowledge investigates the grounds of human knowledge. It deals with the nature, sources, and limits of human knowledge. This course has the objective of initiating students of philosophy into various theories of knowledge. There are four components of a knowledge situation: the knower, the known, the means of knowledge, and the knowledge itself. The knowledge of an object is produced in the subject by a certain medium. Hence, the students need to study in detail the source or how one tries to know the object and then evaluate whether the knowledge obtained is valid or invalid. Such an approach warrants one to look into the various conditions of knowledge on the one hand, and on the other, we need to evaluate whether knowledge is possible.

Course Outcomes

CO1: Explains the history of Indian and Western epistemological traditions (understanding)

CO2: Identifies the various sources of knowledge, theories of truth, possibilities of knowledge and justification of knowledge (applying)

CO3: Develops the mental faculties to steer clear of opinions and beliefs from true knowledge (creating)

CO4: Discusses contemporary issues in the philosophy of knowledge such as relativism, foundationalism, coherentism, reliabilism, contextualism, etc. (creating)

Module 1: Definition and Nature of Epistemology (10 hours)

Concepts and definitions: knowledge, knower, means of knowledge, the object of knowledge, scepticism, foundationalism, certainty; A brief history of epistemology: Indian and Western

Module 2: Knowledge and Belief (10 hours)

Theories of belief: belief as a mental act, belief as a mental state, belief as a behavioural disposition
Four conditions of knowledge: truth condition, belief condition, justification condition, MM Gettier's counter-example and the condition of justification without falsity

Module 3: Sources of Knowledge (15 hours)

Perception, Inference, Comparison, Verbal testimony, Postulation
Non-cognition

Module 4: Theories of Truth (15 hours)

The correspondence theory of truth: theories of evidence - external and internal
The coherence theory of truth
The pragmatic theory of truth - Dewey, William James and Charles Pierce
Deflationary theory of truth, redundancy theory, performative theory and pro-sentential theory of truth

Module 5: Epistemic Justification (10)

Foundationalism, Coherentism, Reliabilism, Contextualism
The notion of certitude: logical certitude, ontological certitude, physical certitude, moral certitude hermeneutics

Module 6: Theory of Knowledge in Indian Thought (15 hours)

The Vedic period
The doctrine of atman in the Upanishadic period
Systematic speculations (the absolute vs. the synthetic view of knowledge)

Suggested Readings

- B. Carr and D.J. O'Connor, Introduction to the Theory of Knowledge, Sussex, 1982.
D.M. Datta, Six Ways of Knowing, The University of Calcutta, 1998
Everson Stephen, ed., Epistemology, Cambridge, 1989.

PYGR301T: PHILOSOPHY OF GOD AND RELIGION

(Credits: 5 – 75 Hours)

Course Objectives

The course aims to describe, analyse, and evaluate the role of religion in the lives of humans since the earliest times and to discover, through rational interpretation of religion, the truth of religious beliefs (especially in God) and the value of religious attitudes and practices in the human quest for growth and fulfilment.

Course Outcomes

- CO1: Outlines a rational interpretation of religious truths (understanding)
- CO2: Develops a series of arguments for the existence of God (applying)
- CO3: Examines the possibility of meaningful religious discourse (evaluating)
- CO4: Evaluates the role of religion in the life of humans since the earliest times (evaluating)

Module 1: Introduction (10 hours)

Shift from Theodicy to Philosophy of God Objects of Philosophy of God and Religion Philosophy of God and Theology

Module 2: Methods in the Study of Religions (10 hours)

Towards a definition of religion

Nature, necessity and Scope of comparative religions

Possibility of and the need for the study of comparative religions Commonality and differences among religions

Module 3: Knowing God (10 hours)

Meanings of meaning - Meaning vis à vis reference - Indirect and direct reference - negative way, positive way, and way of eminence

Faith and reason as two modes of God-talk - trust in the ability of reason - critique of reason as capable of reaching God - between rigorous proofs and complete non-rationality 'Both-And': modal language and model language.

Module 4: Rationality for God's Existence (10 hours)

Pre-philosophical arguments: phenomenological approach, the argument from common human consent, natural desire for perfect happiness.

Philosophical Arguments: the ontological arguments (St Anselm, Descartes, Leibniz), the cosmological arguments (St Thomas, Samuel Clarke), the teleological arguments (St Thomas, William Paley).

Module 5: Challenges to the Existence of God (10 hours)

God and Problem of Evil - faith solutions, philosophical motifs, process solution. God and Atheism Auguste Comte: the religion of humanity Friedrich Nietzsche: Prophet of atheistic humanism Albert Camus: God as surety for suffering Jean-Paul Sartre: God as self-contradiction.

Module 6: Issues in Religions (10 hours)

Incarnation, prophet hood, death, re-birth, after-life, eschatology, liberation

Module 7: Religious Hermeneutics (10 hours)

Religion and moral value Religion and social values Religion and science Possibility of universal religion

Suggested Readings

PYPM302T: POST MODERNISM

(Credits: 4 – 60 Hours)

Course Objectives

As postmodern philosophy questions the importance of power relationships, personalization, and discourse in the construction of truth and worldviews, the students are provided with ample opportunities for critical thinking. The origin of postmodernism can be placed in the closing decades of the twentieth century, when it was first apparently conceived in the visual arts, and then spread to other areas, including philosophy and theology. The term is at once fashionable and elusive but has become a catchword in art, architecture, philosophy, literature, film and music. It has become a powerful concept that can no longer be ignored. It implies a shattering of innocent confidence in the capacity of the self to control destiny. It shatters all trust in global strategies of social planning and undertakes a radical critique of the philosophical systematization of grand theories or metanarratives paving the way for a celebration of pluralism in all spheres of life.

Course Outcomes

CO1: Explains the origin, growth and development of the postmodern philosophy (understanding)

CO2: Develops the philosophies of prominent postmodern thinkers (applying)

CO3: Evaluates postmodern philosophy about postmodern literature, films, music and culture (evaluating)

CO4: Compiles the influences that postmodernism on contemporary thought (creating)

Module 1: Introduction (10 hours)

Preliminary clarification of postmodernism Origin of postmodernism

Characteristics of the modern age

General nature and traits of postmodernism

The transition from modernism to postmodernism Postmodernism as a break with the past Philosophical characteristics of postmodernism

Module 2: Heralds of Postmodernism (15 hours)

Friedrich Nietzsche, Martin Heidegger, Emmanuel Levinas

Module 3: Postmodern Activists (15 hours)

Michael Foucault, Jean Francois Lyotard, Jacques Derrida

Module 4: Postmodern Feminists (10 hours)

Luce Irigaray, Julia Kristeva, Judith Williamson

Module 5: Postmodern Thinkers of India (10 hours)

Homi K. Bhabha, Gayatri Spivak, Jayanta Mahapatra

Suggested Readings

PYHP304T: PHILOSOPHY OF THE HUMAN PERSON AND MIND

(Credits: 4 – 60 Hours)

Course Objectives

The course aims to challenge and stimulate students philosophically to raise the fundamental question, “Who am I?” and to have clarity about human existence and nature by critically and creatively investigating meta-physical and epistemological questions regarding human subjectivity. Human existence is fundamentally co-existence and pro-existence. We are rooted in nature, formed by nurture, and sustained by God; we act upon the world, build up the community, and move towards God.

Course Outcomes

CO1: Explains the metaphysical and epistemological questions regarding human subjectivity (understanding)

CO2: Outlines the role of gender issues in understanding the human person (understanding)

CO3: Examines the fundamental questions about Human Person (analysing)

CO4: Elaborates the various human faculties that distinguish humans from other beings (creating)

Module 1: Introducing the Philosophy of the Human Person and Mind (10 hours)

After defining what the philosophy of the human person and mind is, the module deals with its distinguishing characteristics vis-à-vis other branches of anthropology and psychology and investigates the scope and methods of enquiry. the module also examines briefly the development of the topic in the historical context. both the Eastern and Western course of development is examined for a synthesis of the concept of the human person.

Module 2: Evolution of Life and Human Person (10 hours)

The origin and evolution of life and the human person are studied from scientific, philosophical and religious perspectives. Directed evolution as proposed by Teilhard de Chardin is given importance as a synthesis of scientific, philosophical and religious views.

Module 3: Intellect and Will (15 hours)

Although there are several functions that human bodies perform and are common to all animals, human beings are uniquely endowed with intellect and will. The intellect is an immaterial cognitive faculty that strives actively towards intelligibility and the will is the capacity to choose between the good and the evil that is known by the intellect. The nature of human knowledge with special reference to sense knowledge and intellectual knowledge, the relationship between intellect and will, acts of will, and freedom of will are explored in this unit. These two faculties reside in a spiritual coordinating substance: the soul. The origin, nature and immortality of the human soul are studied especially from a scholastic point of view.

Module 4: Human Person as Inter-Subjective (15 hours)

Human nature is inter-subjective and social and we belong to a community. This aspect of the human person is fundamental because all the species-specific characteristics such as language, culture, work and play have

a social dimension. *Homo sapiens* are also *homo loquens*, *homo fabiens*, and *homo ludens* and they are constitutive of being human.

Module 5: Gender Issues and Human Person (10 hours)

It studies gender relations, gender issues, and gender as a structuring principle in human societies. Feminist points of view are presented to foster co-responsibility, mutual respect and partnership of women and men for building up a gender-just society.

PYSN305T: PHILOSOPHY OF SCIENCE AND NATURE

(Credits: 4 – 60 Hours)

Course Objectives

Philosophy of Science and Nature intends to initiate students into bridging between philosophy, nature, and scientific developments. Apart from introducing students to various scientific paradigms, they are given opportunities to approach those theories from a critical philosophical angle to understand the basic vision of reality that is unveiled and also approach science from a holistic and integral angle. Philosophy began with wonder at the reality that was obvious to human eyes, yet its origin, makeup and growing up during the times gone by have surprised most thinkers. It is different from science as well as myth. The goal of all three is to explain reality, but the methods and courses that they hold on to are quite different. There is a slow development from myth to philosophy and then to science. Myths are not existentially true and meaningful; philosophy tries to be factually true and meaningful by rational investigation. Science attempts to be factually true and does not directly influence existential meaning. Myths provide us with intuitive and existential meaning. Philosophy gives us rational meaning. Science shows us empirical facts.

Course Outcomes

- CO1: Shows the role philosophy plays in understanding nature and scientific developments (remembering)
 CO2: Outlines the various scientific paradigms in understanding the universe (understanding)
 CO3: Identifies the various philosophical and scientific theories that explain matter (applying)
 CO4: Proposes the prospects of the philosophy of science and nature (creating)

Module 1 Introduction to Philosophy of Science and Nature (8 hours)

Introduction; Pre-Socratic and Socratic Understanding of Nature Pre-Copernican Philosophy of Science and Nature Philosophy of Science and Nature in the Middle Ages

Module 2 Philosophy of Science and Nature During the Renaissance (15 hours)

Revolution and its Philosophical Implications Mechanical Philosophy of Nature Contributions made by Copernicus and others Isaac Newton and Classical Mechanics: the concept of force Other schools and their implications.

Module 3 Philosophy of Science and Nature in the Modern Period (15 hours)

Contemporary Philosophy of Science

Logical Positivism: basic ideas, clarifying of terms, implications and critique. Historicism: basic ideas, persons, implications and critique

Historical Realism: basic ideas, persons, implications and critique

Module 4 Philosophy of Science and Nature in the Contemporary Period (15 hours)

Contemporary Philosophy of Nature

Relativistic Revolution: scientific-philosophical implications Quantum Mechanics and its philosophical implications Finite / Infinite Nature of the universe

Scientific theories on the origin and end of the universe

Module 5 The Future of Philosophy of Science and Cosmology (7 hours)

A virtual journey - our journey in science and nature The novel challenges: ecological crisis vs human greed Mechanization of the human mind and thinking patterns

PYHS306T: HETERODOX SYSTEMS IN INDIA

(Credits: 4 – 60 Hours)

Course Objectives

The study of heterodox systems in India helps the students foster an understanding of Indian schools that oppose the authority of the Vedas. It enables the students to interpret diverse atheistic and theistic beliefs and practices and to foster an understanding of diverse systems of thought. Due to their universal outlook and philosophical relevance, Buddhism and Jainism have received increasing attention, even in the Western world. This course offers students an alternative thinking pattern, different from the main line of Hindu thought.

Course Objectives

CO1: Explains the Materialistic Philosophy of India (understanding)

CO2: Examines the origin and development of the Heterodox Systems of India (analysing)

CO3: Compares the Buddhist and Jaina Philosophies in understanding human beings, the world and God (evaluating) CO4: Assess the contributions of the Buddhist and the Jain thought to the Indian Society (evaluating)

Module 1: The Carvaka Philosophy (10 hours)

The origin and scope

The Carvaka epistemology, The Carvaka metaphysics, The Carvaka ethics

Module 2: The Jaina Philosophy of Knowledge (10 hours)

Introduction - origin and history

The Jaina theory of knowledge: nature and kinds of knowledge The Jain theory of judgement: syadvada, saptabhanganaya

Module 3: Jaina Metaphysics (10 hours)

The Jaina conception of substance Classification of substance

The concept of the soul

The inanimate substances: matter, space, time, dharma and adharma

Module 4: Jaina Ethics and Religion (5 hours)

Bondage of the soul Liberation

Jainism as a religion without a God

Module 5: The Ethical Teachings of Buddhism (10 hours)

Origin and history of Buddhism – Buddha, Hinayana, Mahayana

The teachings of Buddhism: the four noble truths, the eightfold path to liberation

The philosophical implications of Buddha's teachings: theory of dependent origination, theory of karma, theory of universal change, theory of the non-existence of the soul

Module 6: The Buddhist Schools of Philosophy (15 hours)

The Madhyamika School of Philosophy, The Yogacara School of Buddhism

The Sarvastivada school of Buddhism - sautrantika and vaibhashika schools

PYFR307P: PROJECT WORK BASED ON FIELD STUDY:

(Credits: 4 – 60 Hours)

Course Objectives

Project-based learning, especially field study, helps students to assess and to deepen the quality of acquired knowledge. It offers the students the possibility of learning beyond the classroom setting.

Course Outcomes

CO1: Identifies the subjects and helps draw correlations between subjects and surroundings, and how the surroundings may influence the behaviour (applying).

CO2: Outlines in-depth information on subjects because they are observed and analysed for a long period (understanding).

CO3: Influences the researcher to fill the gaps in data which can be understood by conducting in-depth primary research (evaluating).

CO4: Combines theory and practical research study by qualitatively analysing the data (creating)

The students are expected to carry out field research during the semester break after 6th semester on themes about the relevance, usefulness, popularity and application of philosophy, Psychology or English Literature in seminaries, colleges or universities under the guidance of a faculty using research tools such as interviews, focus groups, surveys and observation.

The following steps are to be followed while conducting the field study:

Identify and acquire researchers in the field: It is essential to acquire researchers who are specialized in the field of research. Moreover, their experience in the field will help them undergo further steps of conducting field research.

Identify the topic of research: The researcher works on identifying the topic of research. The researchers are responsible for deciding what topic of research to focus on based on the gaps observed in the existing research literature.

Identify the right method of research: After fine-tuning the research topic, researchers define the right method to approach the aim and objectives of the research.

Visit the site of the study and collect data: Based on the objectives, the observations begin. The researcher goes on the field and starts collecting data either by visual observation, interviews or staying along with the subjects and experiencing their surroundings to get an in-depth understanding.

Analyze the data acquired: The researcher undergoes the process of data analysis once the data is collected. **Communicate the results:** The researchers document a detailed field study report, explaining the data and its outcome. Giving the field study a suitable conclusion.

The field research should be for a minimum duration of 60 hours which can be extended depending upon the convenience and requirement of the student and the organisation respectively. The rest of the hours are allotted for completing the Project Report. However, the entire duration of the course should not exceed 120 hours.

The Project Report must be in a spiral bind. It should be accompanied by a recommendation letter from the department and a certificate of authentication from a competent authority from where the research was carried out. The Contents of the Report must include:

- Introduction.
- Need of the study
- Objectives of the study
- Significance of the study
- The methodology which was undertaken for the study
- Description of the work done
- Learning Outcomes
- Feedback from the target audience/community members
- Geotagged photographs

The assessment will be done as follows:

There would be a presentation (PPT) and Viva-Voce Examination during the 7th semester. The Assessment for the project work based on field study will have the following components: a) Report: 40 marks

b) Seminar Presentation: 30 marks

c) Viva-Voce Examination: 30 marks

PYET400T: ETHICS

(Credits: 5 – 75 Hours)

Course Objectives

This course aims at introducing the students to the philosophical need for Ethics starting with a brief discussion of Moral law and how the human person in his or her process of growth intuitively ethical principles. Discussions about the dynamics of morality are undertaken to show how on the one hand new situations call for new responses from a moral point of view and on the other hand certain fundamentals of ethics remain the same in so far as there is something of a common human nature adequately understood. It seeks to respond to some of the important challenges to ethics as a philosophical discipline. Thus, we attempt to look at Indian as well as Western traditions. We, then, shall explore the chief ideas of virtue ethics in various philosophical thoughts and religious traditions. It also aims to understand the important aspects of human rights and the moral importance of duties then proceed with a discussion on current ethical questions. Living in social groups is an essential characteristic of humans. Sociality and individuality are not opposite poles but are related to each other. Therefore, the right knowledge of society with its institutions is essential. We also make a critical look at the political philosophy and moral questions arising out of it. By the end of the course, the students are oriented to gain a detailed understanding of the philosophical issues involved in many contemporary debates in the public sphere as well as developing moral reasoning skills and application of those skills to contemporary social and political issues.

Course Outcomes

- CO1: Explains the nature and principles of human behaviour (understanding)
CO2: Summarises the history of Indian and Western traditions on ethics (understanding)
CO3: Develops the foundations of human behaviour (applying)
CO4: Discusses the various ethical issues in contemporary times and the challenges that legislations of liberal nations pose. (creating)

Module 1: Introduction to Ethics (10 hours)

Nature, scope and subject matter of Ethics Challenges and importance of ethics

Ethics in the History of Indian Philosophy Ethics in the History of Western Philosophy Kinds of ethics
Relation with other disciplines

Module 2: Human Conduct and Responsibility (10 hours)

Human acts Emotions, moods and desires Knowledge
Freedom and determinism Levels of willing and not willing
Modifiers of Responsibility: Ignorance, Strong Emotions, Fear, Force, habit The indirect
voluntary Principle of doubt effect

Module 3: Criteria for Morality (10 hours)

The objective criterion of morality: eternal law, natural law, divine positive law The subjective criterion of
morality: conscience

Module 4: Virtue (10 hours)

Definition, Moral virtues, Cardinal virtues

Module 5: The Objective Good in Moral Life (10 hours)

Good, pleasure, convention, consequences Intuition, reason, law, free-
dom Situation ethics; Love, habit, happiness

Module 6: Ethical Issues Related to Human Life (10 hours)

Bio-Ethics: body care, abortion, suicide, mutilation, euthanasia, artificial birth control and sterilization.
Sexual Ethics: rape, masturbation, pre-marital sex, homosexuality, lesbianism, sodomy, bestiality, fornication,
adultery and incest
Medical Ethics: what is medical ethics; duties of physicians, duties of nurses, patient and doctor relationship,
cloning, stem cell; Hippocratic oath

Module 7: Social Ethics (15 hours)

Personal Ethics: relation to self; relation to the world; relation to others; relation to God; situation ethics
Societal Ethics: liberation ethics, human rights; rights of workers, strikes, social justice, alcoholism, substance
abuse, punishments and capital punishment
Business Ethics: what is business ethics; patent rights, consumer protection and bribe War and Peace: self-
defence, just war theory, nuclear war, peace and non-violence Global Issues: HIV/AIDS, poverty, corruption,
child labour and militancy

PYVP401T: VEDANTA PHILOSOPHY

(Credits: 5 – 75 Hours)

Course Objectives

This course makes the students familiar with the philosophy and spirituality of the Vedanta Schools of Philosophy. It is an introduction to various schools of Vedanta highlighting the history, the context of their origin, the authors and the main teaching of these schools. The focus is on interactive learning where the students will engage themselves in a rigorous and analytical examination of the key ideas present in these schools of Philosophy. The Vedanta Philosophy is an interpretation and exposition of the *Jnanakhanda* section of the Upanishads. The primary thrust of the systems is to delve into the Nature of the self, and its relation to the Ultimate Reality. The systems also speak about the nature of the world in which we live. In the process, the systems deal with how a seeker having lived in this mundane world, attains his liberation (*Moksha*) Vedanta philosophy, though, is an exposition of the *Brahmasutrabhashyas*, *Upanishads* and *Bhagavad Gita*, each one of them is different in their viewpoints.

Course Outcomes

CO1: Outlines the richness of the philosophy and spirituality embedded in the Vedantic texts (understanding).

CO2: Evaluates the Metaphysics, Epistemology, Ethics, and Means of Liberation proposed in Vedantic thought(evaluating)

CO3: Discuss the contributions of great thinkers like Shankara and Ramanuja for the resurgence of Hinduism (creating)

CO4: Assesses the subtle nuances that differentiate diverse schools of Vedanta (evaluating)

Module 1: Introduction (10 hours)

Origin, Meaning and Purpose of Vedanta Philosophy

Module 2: Advaita Philosophy of Shankara (20 hours)

Life, Works, Influences, Brahman and Atman, Knowledge, Maya, World, Liberation

Module 3: Visishtadvaita Philosophy of Ramanuja (15 hours)

Life, Works, Influences, Brahman and Atman, Knowledge, Maya, World, Way of Devotion

Module 4: Dvaita Philosophy of Madhava (10 hours)

Life, Works, Influences, Brahman and Atman, Maya

Module 5: Other Schools of Vedanta Philosophy (10 hours)

Dvaita Advaita of Nimbarka Suddha Advaita of Vallabha Achintya Bhedabheda of Chaitanya

Module 6: The Vaishnavite Philosophy of Srimat Shankerdev (10 hours)

Life, Works, Influences, Understanding of God, Way of Devotion

PYCI404T: CONTEMPORARY INDIAN PHILOSOPHY

(Credits: 5 – 75Hours)

Course Objectives

This course aims at allowing the students to absorb the new spirit of philosophising that emerged due to the mushrooming of different philosophical movements in contemporary India. It allows them to get a feel for the new religious and social outlook that has emerged over time in India. The students would imbibe the spirit of openness and determination shared by contemporary philosophers in India. The main philosophical movements were the Bhakti, Sufi, and Reform movements. The Bhakti movement brought about revolutionary changes in the moral, social, and political perspectives of the people of India. It underscored the need to stand for unity among the religions. The Sufi movement emphasises man's role in enhancing social unity, cultural synthesis, and communal harmony. Reform movements impel us to look at religion critically and scientifically. In the 19th century, after the reform movements, India produced some eminent thinkers who, through their ideas, philosophical and political, shaped the minds of millions and contributed to the nation-building process.

Course Outcomes

CO1: Explains in-depth the philosophical ramifications of events like the Bhakti, Sufi and Reform Movements (understanding)

CO2: Analyses the political, social and philosophical movements of India from the 19th century (analysing)

CO3: Assesses the philosophical thoughts of contemporary Indian thinkers like Gandhi, Vivekananda, K.C. Bhattacharya, Radhakrishnan, Aurobindo, Tagore, and others (evaluating)

CO4: Estimates the influences of ancient philosophy on contemporary Indian thought (creating)

Module 1: Bhakti Movement (15 hours)

Introduction

History of the Bhakti Movement

Nature and Characteristics of the Bhakti Movement

Leaders of Bhakti Movements: Ramanuja, Ramananda, Kabir, Namdeva, Gurunanak, Chaitanya, Tulsi Das, Guru Ramdas, Tukaram

Bhakti movement in South India: Nayanmars, Alvars, Basava Women leaders: Akkamahadevi, Janabai, Mirabai, Bahinabai

Implications of the Bhakti Movement: ethical and Philosophical

Module 2: Sufi Movement in India (15 hours)

Roots of Sufism

History and Development of Sufism in India

Interaction between Hindu and Muslim saints

Module 3: Reform Movement in India (15 hours)

Modern reform movement: the historical context Brahma Samaj: the universalistic reform movement Arya Samaj: the nationalistic reform movement

19th Century Hindu universalism: Ramakrishna Paramahansa, Ramkrishna Mission (Vivekananda), ISKCON Movement

The Guru movements: Osho, Satya Sai Baba,

Module 4: The Philosophy of Contemporary Thinkers (30 hours)

Vivekananda: the concept of God, the concept of the world, the concept of Maya, the concept of the human person, freedom and karma, liberation and the means of liberation, his idea of religion

Aurobindo: His idea of integral yoga, Involution and evolution, levels of reality, the destiny of human being Mahatma Gandhi: life, political ideas - Satyagraha, ahimsa, Sarvodaya, religion, the concept of God

B.R. Ambedkar: social philosophy, political ideas and socio-political criticism, economic ideals and social development, religious criticism and social transformation

S. Radhakrishnan: metaphysics, epistemology, religion and ethics, social and political philosophy

PYPB405T: THE PHILOSOPHY OF THE BHAGAVAD GITA

(Credits: 5 – 75 Hours)

Course Objectives

The objective of this course is to make the students familiar with the philosophy and spirituality of the Bhagavad Gita. This course is an introduction to the Bhagavad Gita, highlighting the history, the context of the text, the author, and the main teaching of the text. The focus is on interactive learning, where the students will engage themselves in a rigorous and analytical examination of the key ideas present in the Bhagavad Gita. It gives answers to many existing philosophical dilemmas. The text highlights some important issues, like the nature of the self and the nature of the non-self, the different paths to liberation, the purpose of incarnation, the true nature of God, and the different qualities of a good person as well as a bad person. Hence, this text helps a student further reflect on Indian philosophy. The Bhagavad Gita is a spiritual classic. Though it is not a sruti text, it is highly regarded by devout Hindus and accepted by many other seekers of truth. This text helps the students delve deep into Indian spirituality. A text-based study of the Gita enables the students to understand and appreciate its rich spiritual and philosophical wealth.

Course Outcomes

CO1: Outlines the richness of the philosophy and spirituality embedded in the Gita (understanding)

CO2: Develops an appreciation for the Metaphysics of the Bhagavad Gita, particularly the Nature of God, the Nature of the true self, different paths to liberation, and the status of liberation (applying)

CO3: Evaluates the ethical values present in the Gita (evaluating)

CO4: Examines the leadership and management qualities Krishna and make them relevant in the present context(analysing)

Module 1: Introduction to the Bhagavad Gita (15 hours)

History, general context and author of the text The immediate context of the Bhagavad Gita The dilemma of Arjuna Arjuna is a representative of every human person in crisis

Module 2: Main Philosophical Ideas in the Bhagavad Gita (15 hours)

The true nature of self

The true nature of the world Different Paths to Liberation The purpose of the incarnation

Module 3: Krishna as a Model of Leadership (10 hours)

Krishna's type of leadership and management Educative transformative leadership The distinction between normal work and nishkama karma

Module 4: The Qualities of Persons with Sattva Guna and Tamas Guna (10 hours)

Qualities of people with demonic nature

Result of entertaining demonic qualities and living in delusion How to guard oneself against taking the road of demonic nature:

Qualities of people with divine qualities, and final success for them

Module 5: Text-based Study (25 hours)

The text of the Bhagavad Gita will be critically explained for an in-depth understanding of its philosophy.

Suggested Readings

Keya Maitra, Philosophy of the Bhagavad Gita: A Contemporary Introduction.

M.K. Gandhi, The Gospel of Selfless Action.

Shri Aurobindo, Bhagavad Gita and its Message.

Swamy Krishnananda, The Philosophy of Bhagavad Gita.

EGGE106T: GENERAL ENGLISH I

(Credits: 4 - 60 Hours)

Course Objectives

The objective of this course is to acquaint the students with language and literature and to whet their appetite for the same. The students are led to a gradual discovery of the three genres: fiction drama and poetry. They are expected to undertake an in-depth analysis of the texts. They are also encouraged to closely examine the various themes and motifs and to have a contextualized reading of the texts. If this exercise is taken seriously the students will acquire the skill to communicate effectively. The outcome will be the ability to critically evaluate and appreciate a particular work.

Course Outcomes

CO 1: Shows familiarity with vocabulary and phraseology (remembering)

CO 2: Illustrates the use of the language effectively in reading, writing and speaking (understanding)

CO 3: Develops the ability to the ability to critically evaluate and appreciate a particular piece of writing (applying) CO 4: Tests the knowledge of English grammar (creating)

Module 1: Selected Novels (15 hours)

Anita Desai - Fasting Feasting

Jane Austen - Sense and Sensibility

Module 2: Selected Dramas (15 hours)

Oscar Wilde - The Importance of Being Earnest. Henrik Ibsen - A Doll's

House Harold Pinter - The Birthday Party

Module 3: Selected Poems (18 hours)

Kamala Das - My Mother at Sixty Six John Donne - Death Be Not Proud

William Wordsworth - The World is Too Much with Us Dante Gabriel Rossetti - The Blessed Damozel

Module 4: Basic English Grammar (12 hours)

Grammar I Grammar II

Suggested Readings

Anita Desai, Fasting Feasting.

D.G. Rossetti, The Blessed Damozel.

Das & Mohanty, Literary Criticism: A Reading, Oxford University Press.

Edward Albert, A History of English Literature, Oxford University Press.

Harold Pinter, The Birthday Party.

Henrik Ibsen, A Doll's House.

Jane Austin, Sense and Sensibility.

John Donne, Death Be Not Proud.

Kamala Das, My Mother at Sixty Six.

M.H. Abrahams, A Glossary of English Terms, Bangalore: Macmillan Publishers India.

Oscar Wilde, The Importance of Being Earnest.

William Wordsworth, The World is Too Much With Us.

Wren & Martin, English Grammar.

PCGP100T: GENERAL PSYCHOLOGY

(Credits: 4 – 60 Hours)

Course Objectives

This introductory course in psychology gives a brief historical sketch of the science of psychology and a glimpse into the methods used in psychology. It also provides knowledge about the various psychological processes that every human being experiences. The paper also has several practicals.

Course Outcomes

- CO 1: Explains the developments and methods in psychology (understanding)
CO 2: Outlines the biological foundations of behaviour, and processes underlying sensation, perception, cognition, memory and motivation (understanding)
CO 3: Evaluates the different psychological processes and behaviours (evaluating)
CO 4: Proposes practicals based on the processes discussed theoretically thus offering the students a hands-on experience (creating)

Module 1: Introduction to Psychology (10 hours)

Definition and Goals of Psychology, Role of a Psychologist in Society
Modern Perspectives: Biological, Psychodynamic, Behaviouristic, Gestalt, Cognitive, Cross-Cultural, Humanistic and Evolutionary Methods: Experimental, Observation, Questionnaire and Inventories, Interview, Clinical Case Study

Module 2: Biology and Behaviour (10 hours)

Neurons: structure of neurons, neural impulses, synapses and neurotransmitters nervous system: central and peripheral nervous systems

Cerebral Cortex: structure and psychological importance in thought and language, the significance of left and right brain, split brain.

Effects of Hormones on Behaviour

Module 3: Sensory-Perceptual Processes (10 hours)

Sensation: basic concepts and processes in sensation

Types of Senses (An Overview): visual, auditory, gustatory, olfactory, tactile, vestibular, kinaesthetic and organic senses Sensory Adaptation: advantages and disadvantages, integration of senses, sensory thresholds

Perception: understanding perception, gestalt laws of organization Different Process of Perception

Correlates of Perception: awareness, set, motives, needs, learning and attention Illusion: subliminal perception, extra-sensory perception

Module 4: Memory and Forgetting (10 hours)

Basic Processes: encoding, storage, retrieval Sensory Storage: iconic memory and echoic memory

STM-working memory, serial position curve, rehearsal, chunking

LTM-Units of Memory: declarative, procedural, semantic, episodic memory

Associative Models: explicit and implicit memory, retrieval cues, state-dependent and context-dependent memory, tip-of-the tongue phenomena, flashbulb memory levels of processing, constructive processes in memory, schemas Forgetting: decay theory, interference theory, prospective memory, absence of retrieval cues, memory dysfunctions Improving Memory: mnemonic strategies

Module 5: Learning and Cognitive Processes (10 hours)

Attention: definition, characteristics, selective attention and divided attention process of thinking, Types: Reasoning-types, problem-solving, decision making, creative thinking, concept formation

Classical Conditioning: basics of conditioning, operant conditioning Language and thinking, imagery and thinking

Cognitive Learning: latent learning, observational learning, insight learning

Module 6: Motivation and Emotion (10 hours)

Motivation: meaning, approaches-instinct, drive reduction, arousal, incentive, cognitive, humanistic Maslow's Need Hierarchy: types, physiological motivation (hunger, thirst, sex, maternal drive), psychological motivation (achievement, affiliation, power, parenting)

Emotion: meaning, the physiological basis of emotions

Theories-James Lange Theory, Cannon-Bard Theory, Cognitive Theory Emotional Expression

Suggested Readings

R.S. Feldman, Understanding Psychology, 4th ed., New Delhi: McGraw Hill, 2006.

Atkinson Hilgard, Introduction to Psychology, Oxford: IBH Publishing, 1975.

King Morgan, Weiss and Schopler, Introduction to Psychology, 7th ed., New Delhi: McGraw Hill, 1989.

Robert A. Baron, Psychology, 3rd ed., New Delhi: Prentice Hall, 2001.

EGGE207T: GENERAL ENGLISH II

(Credits: 4 – 60 Hours)

Course Objectives

The course intends to broaden the mental horizons of the students by unfolding before them the philosophy, wit, and wisdom that is contained in the selected literary works. It helps in the correction of taste, that is, the ability to distinguish between the excellent and the mediocre. The course assists the students in bringing the necessary literary gravitas to their academic pursuits.

Course Outcomes

CO 1: Shows familiarity with vocabulary and phraseology in written English (Remembering).

CO 2: Illustrates the use of the language effectively in selected short stories and essays (understanding).

CO 3: Develops the ability to articulate thoughts and ideas meaningfully coherently and cogently with certain lexical elegance (applying).

CO 4: Tests the knowledge of the English language and composition (creating).

Module 1: Selected Short Stories (20 hours)

The Happy Prince - Oscar Wilde, The Necklace - Guy de Maupassant

The Open Window - Hector Hugh Munro, The Last Leaf - O. Henry

Module 2: Selected Essays (20 hours)

The Origin of Species - Charles Darwin of Studies - Francis Bacon

Module 3: Language and Composition (20 hours)

Suggested Readings

Charles Darwin, The Origin of Species.

Das & Mohanty, Literary Criticism: A Reading. Oxford University Press.

Edward Albert, A History of English Literature, Oxford University Press.

Francis Bacon, Of Studies.

Guy de Maupassant, The Necklace.

Hector Hugh Munro, The Open Window.

PCDP200T: DEVELOPMENTAL PSYCHOLOGY

(Credits: 4 – 60 Hours)

Course Objectives

Developmental psychology is a branch of psychology that seeks to provide a general introduction to various developmental concepts across the different stages of life, with the nature versus nurture debate as a concurrent theme. It focuses on advancing knowledge of the processes of change for individuals across the lifespan. Topics of research interest include developmental theories, methods of investigating life-span change, as well as such processes as cognition, memory, theories of mind, identity, risk-taking, social relationships, and problem behaviour.

Course Outcomes

CO 1: Explains human development from conception till adulthood (understanding)

CO 2: Develops topics such as biological beginnings, development and change across infancy, childhood, adolescence and adulthood (applying)

CO 3: Compares the psychological ramifications at the various stages of human development (analysing)

CO 4: Proposes healthy psychological growth of a human person (creating)

Module 1: Introduction (10 hours)

Concept of Human Development: introduction, meaning, stages of lifespan development

Aspects of human development: physical, social, cognitive, moral principles of human Development (Balte)

Factors influencing human development: ecological factors, hereditary factors

Theories of human development: Erickson, Piaget, Vygotsky (Dialectical), Kohlberg Biological Beginnings of Development

Genetic Foundations: genetic processes and genetic principles; chromosomal and gene-linked abnormalities

Module 2: Pre-natal Development and Infancy (10 hours)

Prenatal development: course of prenatal development; teratogens and prenatal environment, heredity, environment and individual differences

Infancy: characteristics of Infancy

Physical, motor development, emotional development, language development new-born reflexes and their adaptive value: (optical, Palmer, Babinsky, Moro, sucking, rooting, swimming, walking, placing), the importance of assessing new-born reflexes

Module 3: Childhood (10 hours)

Subdivisions of childhood, characteristics of each period

Aspects of development: physical development, cognitive development, language development, emotional development, psychosocial development

Module 4: Puberty and Adolescence (10 hours)

Puberty: meaning, biological changes (sexual maturation, growth spurt, secondary sexual characteristics) Reactions to physical changes

Adolescence: characteristics of adolescence Marcia's stages of development of personal identity

Development of a career stage in vocational planning influences vocational planning Adolescent relationships: family, peers, adult society

Module 5: Adulthood (20 hours)

Subdivisions, characteristics of each stage Early adulthood

Vocational Adjustment: choosing an occupation, stability of vocational selection foundations of intimate relationships:

friendship, love, sexuality

Marriage: marital adjustment and conditions influencing it Parenthood: adjustment to parenthood

Middle adulthood occupational adjustment: stable and unstable patterns, preparation for retirement Psychosocial changes: coping with midlife crisis

Changes in relationships: marriage, relationship with maturing children, ageing parents, siblings, grandparenthood, friendships; late adulthood

Primary and secondary ageing, theories of ageing

Psychosocial aspects: models of coping, models of successful ageing, lifestyle and social issues (work retirement and leisure) Personal relationships: relationship with adult children, siblings, great-grandparenthood

Aspects of death: biological, sociocultural aspects, psychological aspects, patterns of grieving

EGAE309T: ALTERNATIVE ENGLISH I

(Credits: 4 – 60 Hours)

Course Objectives

The study of literature has to be discursive. This course presupposes a movement on the part of the students to engage in more serious literature to be able to identify the technique and craft of different authors. It intends to take the students to a higher level of appreciation for the work. It will also set in motion a preparedness for serious research.

Course Outcomes

CO1: Shows familiarity with vocabulary and phraseology in written English (Remembering).
 CO2: Illustrates the use of the language effectively in selected poems, dramas and novels (understanding).
 CO3: Develops the ability to articulate thoughts and ideas meaningfully coherently and cogently with certain lexical elegance (applying).
 CO4: Tests the knowledge of the English language and composition (creating).

Module I Introduction to Poetry (20 hours)

Key terms, concepts and literary devices Selected Poems:

P.B Shelley- Ode to the West Wind Nissim Ezekiel - The Professor

William Butler Yeats - The Second Coming Matthew Arnold – The Dover Beach

Module 2: Introduction to Drama (20 hours)

Key Terms and Concepts

Selected Dramas: George Bernard Shaw- Candida and Oliver Goldsmith - She Stoops to Conquer

Module 3: Introduction to Novel (20 hours)

Key terms

Selected Novels: George Orwell, The Animal Farm Earnest Hemingway, The Old Man the Sea

Suggested Readings

Das & Mohant, Literary Criticism: A Reading. Oxford University Press.

Earnest Hemingway, The Old Man and the Sea.

Edward Albert, A History of English Literature, Oxford University Press.

George Bernard Shaw, Candida.

George Orwell, The Animal Farm.

M.H. Abrahams, A Glossary of English Terms, Bangalore: Macmillan Publishers India.

PCPP300T: THEORIES OF PERSONALITY AND POSITIVE PSYCHOLOGY

(Credits: 4 – 60 Hours)

Course Objectives

Understanding the theories of personality helps understand the behaviour patterns of individuals. It is important for the wellbalanced psychological growth of an individual. Positive psychology, on the other hand, is the scientific study of what makes life worth living, focusing on individual and societal well-being. It acquaints the students with positive subjective experiences, positive individual traits, and positive institutions. It aims to improve the quality of life.

Course Outcomes

CO1: Explains the inner dynamics of human nature (understanding)

CO2: Demonstrates the uniqueness and the immense value of every person (understanding)

CO3: Identifies the various forces – both environmental and hereditary – that shape human personality (applying)

CO4: Examines the various theories of personality (analysing)

Module 1: Freud's Classical Psychoanalytical Theory (15 hours)

The structure of personality: The Id, the Ego and the Superego The dynamics of personality: psychic energy and instincts The stages of development: oral, anal, genital, phallic, latency period, etc.

Contemporary Psychoanalytical Theory: Erikson's concept of the life cycle and eight stages of human development

Module 2: Jung's Analytical Theory (10 hours)

Analytical psychology versus psychoanalysis

The structure of personality: the ego, the personal unconscious and complexes, the collective unconscious

The Archetypes: persona, anima and animus, shadow, self

Module 3: Social Psychological Theories (10 hours)

Adler's five major contributions to personality theory; the five major sources of his thought: inferiority feelings and compensation, striving for superiority, family, order of birth and personality, style of life

Fromm's analysis of human loneliness and isolation the basic conditions of human existence and the specific needs; the five character types; the problem of human beings' relations to society; humanistic communitarian socialism as the perfect society Horney's strategies for coping with basic anxiety; the ten 'neurotic' needs; moving towards people, moving away from people, and moving against people

Module 4: Organismic Theory (10 hours)

The principal features of the organismic theory

Kurt Goldstein: the structure of an organism; the dynamics of the organism; the development of the organism

Andras Angyal: the structure of the biosphere; the dynamics of the biosphere; the development of personality

Maslow's humanistic psychology as the "third force," the human potential movement, the hierarchy of motives, characteristics of self-actualized persons and peak experiences

Module 5: Rogers' Person-Centred Theory (10 hours)

The structure of personality: organism and self; congruence and incongruence the dynamics of personality the development of personality

Module 6: Constitutional Psychology (10 hours)

Spranger's six types of personalities: theoretical, economic, aesthetic, social and power-politics types
Kretschmer's three types of physiques and the corresponding personality types
Sheldon's Atlas of men and Atlas of women

Module 7: Eastern Psychology (15 hours)

Eastern psychologies and Western personality theories

Abhidhamma theory: unhealthy and healthy factors; personality types, means to healthy personality; concentration and altered states of consciousness

PYRM402T: RESEARCH METHODOLOGY

(Credits: 2– 30 Hours)

Course Objectives

The objectives of the course in Research Methodology include an understanding of the research process and acquiring the attitudes and skills essential for research, developing skills for interpretation, documentation and presentation of results of the research, the process of report writing and publication, and basic statistics.

Course Outcomes

CO1: Identifies the various components involved in research (applying).
 CO2: Outlines the basics in Statistics (understanding).
 CO3: Illustrates the different steps involved in the research process (understanding).

Module 1: Introduction to Research (5 hours)

Philosophical Foundations of Research; Natural and social science research- characteristics and scientific attitude.; Scope of social science research

Module 2: Research designs, approaches and types (8 hours)

Research designs: Descriptive, Exploratory and Experimental: meaning, scope, characteristics, application in a social work setting.

Research Approaches: Qualitative and Quantitative Research: meanings, scope, methods, steps, sampling, data collection, analysis, interpretation and reporting. Strengths and weaknesses.

Evaluative research: Programme and project evaluation: concept, types, steps, reports.

Module 3: Steps in Research Process (12 hours)

Problem Formulation: Identifying the research issue, formulating the research topic and problem, reviewing the literature (library work), theoretical framework, formulating objectives, clarifying concepts, and variables- conceptual and operational, and formulating hypothesis.

Population and Sampling: Inclusion and exclusion criteria of population, the logic of sampling size and techniques: probability and non-probability sampling.

Tools for data collection: Levels, Types of measurements, reliability and validity of tools. Constructing tools for data collection: questionnaire, interview schedule, scales. Quantification of qualitative data.

Sources, Collection and Analysis of Data: Secondary and primary sources. Data collection data editing, coding, master sheet, analysis, report writing. Using a computer for data analysis: coding, analysis- graphs and results. Professional report writing

Module 4: Introduction to Statistics for Research (5 hours)

Statistics: Definition, Uses and Limitations. Classification and tabulation of data, univariate and bivariate, diagrammatic and graphic presentations. Measures of central tendencies, Mean, Median and Mode and their uses. Measures of variability range, variance and standard deviation.

PCSP400T: SOCIAL PSYCHOLOGY

(Credits: 3– 45 Hours)

Course Objectives

The course seeks to give comprehensive knowledge about the psychological ramifications that follow from the fact that a human being is a social animal. Social psychology is the study of how individual or group behaviour is influenced by the presence and behaviour of others. The major question social psychologists ponder is this: How and why are people's perceptions and actions influenced by environmental factors, such as social interaction?

Course Outcomes

CO1: Explains the psychological ramifications of human beings considered social beings (understanding)

CO2: Demonstrates the processes such as social relationships and problem behaviour (understanding) CO3: Evaluates the role of society in the growth of a human person (evaluating)

CO4: Discusses concepts such as motivation, self-concept, attitude and conflict (creating)

Module 1: Introduction (15 hours)

Definition and History of social psychology

Theories: motivational, learning, cognitive, decision-making, interdependence, socio-cultural, evolutionary, and mid-range theories

Module 2: Social Perception (15 hours)

Self-concept: beginning, formation; self: schemas and multicultural perspectives self-presentation: false modesty, selfhandicapping, impression management self-esteem: development and consequences perceiving persons: attribution logic, integration, confirmation bias

Module 3: Positive Social Relations (10 hours)

Pro-Social behaviour: origin, helping, influences (personal, interpersonal and situational), receiving help interpersonal attraction and affiliation: characteristics of the individual, others and situational influences

Module 4: Negative Social Relations (10 hours)

Perceiving Groups: stereotypes, prejudices (individual differences and reducing prejudice) Aggression: origin, influences (social and situational), forms, prevention and control

Module 5: Social Influences (10 hours)

Attitudes: formation, attitude and behaviour, attitude change

Group: formation, function (roles, status, norms and cohesiveness), productivity, groupthink, conflict and conflict resolution

SKILL ENHANCEMENT COURSES

Semester	Category	Course Code		Credits
1	S E Course 1	PYMT102L	Basics in Motor Mechanics/Tailoring and Plumbing	3
2	S E Course 2	PYOA104L	Basics in Office Automation	3
3	S E Course 3	PYBE205L	Basics in Electrical and Electronics	3

PYMT102L: BASICS IN MOTOR MECHANICS/TAILORING AND PLUMBING

(Credits: 3 - 90 Hours)

Course Objectives

The course intends to offer hands-on training to the students in skills. In this skill enhancement course, the students are acquainted with two skills, namely, motor mechanics (for boys) and tailoring (for girls) and plumbing (for both boys and girls). The students will have 45 hours of theory classes and 45 hours of practicum.

Course Outcomes

CO 1: Demonstrates basic skills in motor mechanics, tailoring and plumbing (understanding)

CO 2: Shows the basic safety practices in motor mechanics, tailoring and plumbing (understanding)

CO 3: Identifies the basic errors in motor mechanics, tailoring and plumbing (applying)

CO 4: Analyses the basic operations in motor mechanics, tailoring and plumbing (analysing)

Module 1: Basics in Motor Mechanics/Tailoring (25 hours of theory and 25 hours of practicum)

Motor Mechanics: aggregates and components of a vehicle, hand tools and special tools, workshop calculations, terms and terminologies, components of a vehicle.

Tailoring: machine classification, needle anatomy, industrial sewing machine, cleaning of the sewing machine, sewing machine motors, threads, safety tips, sewing fundamentals, exercise, stitch and seam classification, sewing and fabric defects, recognising garment parts, sewing methods and garment construction.

Module 2: Basics in Plumbing (20 hours of theory and 20 hours of practicum)

Plumbing tools, piping materials and fittings, plumbing fixtures, designing plumbing systems, preparing for plumbing system installation, installing water supply piping, installing fixtures, faucets, and appliances.

Suggested Readings

Automobile Repair, New Delhi: Don Bosco Tech Society.

Modern Plumbing (Seventh Edition), ISBN 9781605252360.

Sewing Machine Operator, New Delhi: Don Bosco Tech Society.

PYOA104L: BASICS IN OFFICE AUTOMATION

(Credits: 3 – 90 Hours)

Course Objectives

This skill enhancement course in office automation is aimed at teaching the students digital concepts as well as various other skills that they will need to succeed in the modern workplace. The course offers an added advantage to students while applying for jobs in various sectors, be they governmental or non-governmental. The students will have 45 hours of theory classes and 45 hours of practicum.

Course Outcomes

CO 1: Defines the various computer programmes that are employed for office management (remembering)

CO 2: Explains the various uses of computers in office management (understanding)

CO 3: Develops typing skills, designing and publishing using computer software (applying)

CO 4: Discusses office procedures and the various devices used in a modern office (creating)

Module 1: Computer Science and Operating System (10 hours of theory and 10 hours of practicum) Typing Skills, Basics of Computer, Programming, Windows**Module 2: Personal Computer Software Tools (10 hours of theory and 10 hours of practicum)**

MS Word, MS Excel, MS PowerPoint

Module 3: Designing and Publishing software (15 hours of theory and 15 hours of practicum) PageMaker, Photoshop and Corel Draw

Module 4: Office Procedures and the Devices Engaged in Modern Office (10 hours of theory and 10 hours of practicum) Photocopier, Risograph, Scanners, Laminating Machine, etc.

Suggested Readings

1. Course on Computer Concepts. Kolkata: BPB Publication.

PYBE205L: BASICS IN ELECTRICAL AND ELECTRONICS

(Credits: 3 – 90 Hours)

Course Objectives

The course intends to offer hands-on training to the students in skills. In this skill enhancement course, the students are acquainted with two skills, namely, electrical and electronics. The students will have 45 hours of theory classes and 45 hours of practicum.

Course Outcomes

CO 1: Demonstrates basic skills in electrical and electronics (understanding)

CO 2: Shows the basic safety practices in electrical and electronics (understanding)

CO 3: Identifies the basic errors in electrical and electronics (applying)

CO 4: Analyses the basic operations in electrical and electronics (analysing)

Module 1: Basics in Electricals (25 hours of theory and 25 hours of practicum)

Basic tools & safety: introduction to electricity, safety precautions, elementary first aid, identification of different hand tools with their specifications-care and maintenance of hand tools, ohms law, resistance electric signs & symbols

Electrical Wires: identification of various types of wires used for house wiring, motor winding in electrical appliances, their uses and sizes

Electric Accessories & Meters: common electric accessories and fixtures with their specifications installation of different types of electric meters and instruments (portable type panel/board type)function and uses of ampere meter, voltmeter, energy meter, wattmeter, megger

Protective Devices: Understanding of fuses and circuit breakers (Kit-Kat Type, H.R.C. Fuse, Cartridge Fuse, M.C.B. ELCB) earthing: the purpose of earthing, methods of earthing (plate & pipe earthing)

Complete house-wiring layout, Splitting load wire by NEC I.E.E. rules, multi-storeyed system, fault finding and troubleshooting.

Module 2: Basics in Electronics (20 hours of theory and 20 hours of practicum)

Basic technical know-how in fitting, assembling, repairing and maintaining electronic equipment such as computers, televisions, solar panels, UPS, inverters and mobiles.

Domestic Appliances: working principles and circuits of common domestic equipment and appliances: calling bell, buzzer, alarms, electric iron, heater, light. electric kettle, heater/immersion heater, hot plate, oven, geyser, cooking range, mixer, washing machine, motor pump set, etc.

INTERNSHIPS (Conducted after 4th Semester and evaluated in 5th Semester)

Semester	Category	Course Code	Course Name	Credits
5	Internship	PYIN303L	Teaching in Schools	2

PYIN303L: TEACHING IN SCHOOLS**Course Objectives**

This course is intended to acquire practical know-how in teaching and the art of accompanying children. It provides a compelling reason to learn, teaches the skills of civic participation and develops an ethic of service and civic responsibility. It increases motivation and retention of academic skills as specific learning goals are tied to community needs. The students are expected to spend some days in schools that are assigned to them. They will be engaged in teaching and in other co-curricular activities that are beneficial to the children.

Course Outcomes

CO1: Develops familiarity with the social and economic situation of the localities where the internships are carried out (applying).

CO2: Extends the facilities of learning and teaching techniques to lesser privileged children (understanding)

CO3: Evaluates the teaching abilities or social sensibilities of students (evaluating)

CO4: Improves the intellectual and psychological well-being of the children as well as the beneficiaries of social work (creating)

The students have to undergo the internship during the semester break after the 4th semester. They are expected to keep a daily report of the activities that they carry out and the learning outcomes during the entire period of the internship. The faculty members will supervise them during this period. After completing their internship, they need to produce a certificate of completion from the headmasters or principals of the concerned schools.

The internship should be for a minimum duration of 30 hours which can be extended depending upon the convenience and requirements of the student and the school respectively. The rest of the hours are allotted for completing the Report. However, the entire duration of the course should not exceed 60 hours.

The Report must be in a spiral bind. It must be accompanied by a certificate of authentication from the headmaster/principal of the school in which the candidate underwent the internship. The Report must contain a detailed description of the activities performed, learning outcomes, feedback from the target group and Geo-tagged photographs.

The assessment will be based on the presentation (PPT) and Viva-Voce Examination after the completion of the internship.

The Assessment for the internship will have the following components: a) Report: 40 marks

b) PPT Presentation: 30 marks

c) Viva-Voce Examination: 30 marks

RESEARCH PROJECT/DISSERTATION

BA Philosophy (Honours)				
Semester	Category	Course Code	Course Name	Credits
7	Research Project/Dissertation	PYDI403P	Dissertation Based on Themes in Philosophy or Psychology	6
8	Research Project/Dissertation	PYDI406P	Comprehensive Evaluation of Dissertation and Philosophy (Viva-Voce)	6

PYDI403P: DISSERTATION BASED ON THEMES IN PHILOSOPHY OR PSYCHOLOGY

Credits: 6

Course Objectives

Dissertations are an important method of demonstrating that the students can identify a topic of concern to the field, and read, understand and incorporate the relevant literature into a new research question to be investigated. It involves active research, coming up with a question, following a defined methodology and engaging with the work of other researchers. It is a rite of passage within education and shows that the students can 'do' what they have been studying.

Course Outcomes

CO1: Develops descriptive, analytic and synthetic skills in writing (remembering).

CO2: Demonstrate a sense of originality, self-discipline and hard work (understanding)

CO3: Assumes a thorough knowledge of the subject matter under research (analysing)

CO4: Shows that the researcher can undertake independent work and, depending on the final result, move to a high standard in terms of quality (understanding)

One thesis, not exceeding 18,000 words, on a specialised subject during the seventh semester. Registration for the thesis will be done during the sixth semester.

The student selects the theme and a guide (promoter) among the faculty members in consultation with the HoD, Department of Philosophy.

The scheme of the thesis (with a minimum of 300 words) has to be submitted for approval before the completion of the sixth semester.

The scheme shall include the relevance of the theme, methodology, titles, an outline of the chapters, and a working bibliography.

The departmental meeting shall approve the schemes of the theses in the sixth semester itself.

The students will be allotted 180 class hours during the seventh semester for the completion of the thesis.

The thesis shall be submitted at least one month before the end of the seventh semester.

The thesis should be typewritten in the format prescribed by the Department of Philosophy.

Three bound copies of the thesis are to be submitted to the office.

The thesis will be evaluated by the respective guide (promoter). There will also be a public defence of the thesis for 30 minutes in the eighth semester.

The Assessment for the dissertation will have the following components:

- a) Evaluation of the guide (promoter): 60 marks
- b) Viva-Voce Examination: 40 marks

PYDI406P: COMPREHENSIVE EVALUATION OF DISSERTATION AND PHILOSOPHY (VIVA-VOCE)

Credits: 6

Course Objectives

The purpose of the comprehensive evaluation is for students to demonstrate mastery of knowledge in philosophy, the subject in which they are majoring. It also gives the students opportunities to exhibit their familiarity with research. The comprehensive evaluation of dissertations and philosophical subjects consists of a viva voce examination.

Course Outcomes

CO1: Develops systematic and critical philosophical thinking (applying)

CO2: Examines the extent of philosophical knowledge acquired during the course of study (analysing) CO3: Evaluates the capacity of a candidate for a comprehensive understanding of things (evaluating). CO4: Assesses the internalising capacity of the intellectual inputs (evaluating).

The students shall have a comprehensive viva voce examination at the end of the eighth semester. The students will be allotted 180 class hours for the examination. The duration of the viva voce examination will be an hour before two panels (2x2) of four examiners, which can be held in two different phases. In the first phase, the candidates will appear before the first panel, and they will be asked to present in brief the findings of the dissertation prepared in the seventh semester, and questions based on them will be asked. In the second phase, before the two- member panel, the candidates will be examined for 30 minutes on the principal courses in philosophy. This will also last for 30 minutes. Both panels will evaluate the performance of the candidates out of 100, and the average is taken for the final reckoning. The comprehensive viva voce examinations will carry a weightage of 6 credits.

DEPARTMENT OF HOSPITALITY AND HOTEL ADMINISTRATION

PROGRAMME: BACHELOR OF SCIENCE in HOSPITALITY AND HOTEL ADMINISTRATION (BSC)

DEGREE: BSC HHA (HONOURS)/ BSC HHA (HONOURS) WITH RESEARCH

VISION

To develop design and deliver research-based personalized education that equips students to become global hospitality professionals. Our aim is to impart knowledge, skills and abilities to the students through the holistic approach for nurturing them as dependable human leaders. We do develop our students to interface with stakeholders and to deliver hospitality Professionals that add to the financial, intellectual, environmental, ethical, cultural and social growth of the nation

MISSION

The mission of this department is to be a leading hospitality institution imparting quality education of global excellence leading to hospitality ready professionals carrying ethical and social values.

PROGRAMME OUTCOMES (PO)

- PO 1: Critical Thinking: Demonstrate professional aptitude, critical thinking, problem solving skills, and leadership skills needed for all sectors in the hospitality industry.
- PO 2: Effective Communication: Speak, read, write and listen clearly in person and through electronic media in English and in one more foreign language.
- PO 3: Social Interaction: Elicit views of others, mediate disagreements and help reach conclusions in the organizational and operational structure of hospitality industry.
- PO 4: Effective Citizenship: Demonstrate awareness and understanding necessary for social concern and equity towards national development.
- PO 5: Ethics: Apply ethical standards in the professional field and accept responsibility for them.
- PO 6: Environment and Sustainability: Understand the issues of environmental contexts and sustainable development.
- PO 7: Self-directed and Life-long Learning: Acquire the ability to engage in independent and life-long learning in the field of hospitality management.

PROGRAMME SPECIFIC OUTCOMES (PSO)

- PSO 1: Conceptual skills: Proficient in the core functional and support areas of hospitality sectors to plan and coordinate business related events.
- PSO 2: Management skills: Manage structures and finance of the industry, as well as disaster management.
- PSO 3: Problem solving skills: Develop legal awareness for handling real-life challenges of hospitality industry.
- PSO 4: Entrepreneurial skills: Achieve necessary skills to become a hospitality entrepreneur.

LIST OF COURSES

- 1.1: Introduction to Food & Beverage service
- 1.2: Introduction to gastronomy & hygiene practices
- 1.3: **Multidisciplinary**
- 1.4: **Ability Enhancement**
- 1.5: Introduction to room division
- 1.6: **Common value added**
- 1.7: **Common value added**
- 1.8: **Community Engagement**
- 1.9: Introduction to Food & Beverage service Practical
- 1.10: Introduction to gastronomy & hygiene practices Practical
- 2.1: Restaurant Ethics & Menu planning

- 2.2: Culinary & Baking skills
- 2.3: **Multidisciplinary**
- 2.4: **Ability Enhancement**
- 2.5: Functional areas & cleaning agents
- 2.6: **Common value added**
- 2.7: **Common value added**
- 2.8: **Community Engagement**
- 2.9: Restaurant Ethics & Menu planning Practical
- 2.10: Culinary & Baking skills Practical
- 2.11: Vocational Training **
- 3.1: In room dining & beverages
- 3.2: Indian Gastronomy
- 3.3: Room reports & surface cleaning
- 3.4: **Multidisciplinary**
- 3.5: **Ability Enhancement**
- 3.6: Introduction to Marketing
- 3.7: In room dining & beverages Practical
- 3.8: Indian Gastronomy Practical
- 3.9: Room reports & surface cleaning Practical
- 4.1: Bar operation & Outlet Management
- 4.2: Quantity Food Production
- 4.3: Front Office Management
- 4.4: Housekeeping supervision and Budgeting
- 4.5: **Ability Enhancement**
- 4.6: Bar operation & Outlet Management Practical
- 4.7: Quantity Food Production Practical
- 4.8: Front Office Management Practical
- 4.9: Housekeeping supervision and Budgeting Practical
- 4.10: Vocational Training **
- 5.1: Restaurant Planning & Management
- 5.2: Garde Manger & Confectionary
- 5.3: Revenue Management & Budgeting
- 5.4: Advance Housekeeping Management
- 5.5: Field Project/ Apprenticeship
- 5.6: Restaurant Planning & Management Practical
- 5.7: Garde Manger & Confectionary Practical
- 5.8: Revenue Management & Budgeting Practical
- 5.9: Advance Housekeeping Management Practical
- 6.1: Training & Development – Food & Beverage service
- 6.2: Training & Development – Gastronomy
- 6.3: Training & Development – Front Office
- 6.4: Training & Development – Housekeeping
- 6.5: Training report presentation

4 YEAR UG Degree (Honours)

- 7.1: Modern Trends in Gastronomy – I / Modern Trends in Front Office –I
- 7.2: Modern Trends in Food & Beverage service –I / Modern Trends in Housekeeping – I
- 7.3: Basics of Tourism
- 7.4: Research Methodology
- 7.5: Project Phase –I / Dissertation Phase – I
- 7.6: Modern Trends in Gastronomy – I Practical / Modern Trends in Front Office –I Practical
- 7.7: Modern Trends in Food & Beverage service –I Practical / Modern Trends in Housekeeping – I Practical

8.1: Modern Trends in Gastronomy – II / Modern Trends in Front Office –II

8.2: Modern Trends in Food & Beverage service –II / Modern Trends in Housekeeping – II

8.3: Organizational Behaviour

8.4: Project Phase –II / Dissertation Phase – II

8.5: Modern Trends in Gastronomy – II Practical / Modern Trends in Front Office –II Practical

8.6: Modern Trends in Food & Beverage service –II Practical / Modern Trends in Housekeeping – II Practical

4 YEAR UG Degree (Research)

7.1: Research Methodology

7.2: Dissertation Phase – I

8.1: Dissertation Phase – II

HAFB100T: INTRODUCTION TO FOOD & BEVERAGE SERVICE

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s)

The objective of the course is to learn the basic knowledge about the departmental structures and outlets in the food & beverage service sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the Food and Beverage Industry and Service Areas. (Understand)

CO 2: Identify and demonstrate types and usage of food and beverage service equipments (Knowledge)

CO 3: Analyze types of Attributes required becoming a Food and Beverage Service Personnel. (Analyze)

CO 4: Develop, understand and demonstrate the different types of menus provided by different food outlets and their service techniques. (Create)

Module I: THE HOTEL & CATERING INDUSTRY (07 hours)

Introduction to the Hotel Industry and Growth of the hotel Industry in India

Role of catering establishment in the travel/tourism industry

Types of F&B operations (Types of different F&B Outlets)

Classification of Commercial, Residential/Non-residential

Welfare Catering - Industrial/Institutional/Transport such as air, road, rail, sea, etc.

Structure of the catering industry - a brief description of each

Module II: DEPARTMENTAL ORGANIZATION & STAFFING (08 Hours)

Organization of F&B department of the hotel

The principal staff of various types of F&B operations

French terms related to F&B staff

Duties & responsibilities of F&B staff

Attributes of a waiter

Inter-departmental relationships (Within F&B and other departments)

Module III: FOOD SERVICE OUTLETS & ANCILLARY DEPARTMENTS (8 hours)

Specialty Restaurants

Coffee Shop

Cafeteria

Fast Food (Quick Service Restaurants)

Grill Room

Banquets

Bar
Vending Machines
Discotheque
Pantry
Food pick-up area
Store
Linen room
Kitchen stewarding

Module IV: F & B SERVICE EQUIPMENTS (06 Hours)

Familiarization & Selection factors of - Cutlery - Crockery - Glassware - Flatware – Hollowware- All other equipment used in F&B Service
French terms related to the above

Suggested Readings

- 1.Lillicrap Dennis R., Food & Beverage Service, Hodder Arnold Publication, 2006.
- 2.Singaravelavan R. Food & Beverage Services, Oxford Publications, 2011
- 3.Dhawan, Vijay, Food & Beverage Service - Franc Brothers, 2009.

HAFB101L: INTRODUCTION TO FOOD & BEVERAGE SERVICE PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn the table layouts and identifications of basic tools and hygiene practices required in food & beverage service sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the principles of basic hygiene practices and body language in the department (Understand)

CO 2: Identify the process of laying tables arranging things in order. (Knowledge)

CO 3: Analyze& demonstrate service of water and serving plates (Analyze)

CO 4: Analyze& explain care and maintenance procedures of different equipment (Analyze)

CO 5: Develop & familiarize with different tools of F&B service. (Create)

Practical:

Hygiene and Etiquettes in Restaurant

Mis- En –Place and Mis- En –Scene activities

Identification of F&B Tools, types of equipment, Cutlery, Crockery, Glass & Chinaware, Flatware, Hollowware, Table Appointments, Linen, etc

Care and Maintenance of various Tools, a type of equipment, Flatware, Hollow wares.

Side board Organization and its importance

Laying & Relaying of Table.

Rules for Laying Cover, Various types of Napkin folds

Importance of Body Language and Dinning etiquettes.

Carrying a Salver/Tray, Plates, Glasses & other types of equipment

Service of Water

Handling the Service Gear

Clearing an Ashtray, and precautions to be taken care of for handling operation.

sHARM102T: RESTAURENT ETHICS & MENU PLANNING

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn different types of menu's & controlling procedures required in food & beverage service sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain the different types of breakfast and other meals and their service techniques (Understand)

CO 2: Identify and demonstrate the different types of menus provided by different food outlets. (Knowledge)

CO 3: Analyze and understand the different aspects of control methods used in food and beverage departments (Analyze)

CO 4: Analyze& classify the different types of Cigars and cigarettes. (Analyze)

CO 5: Develop & illustrate customer care and situation handling (Create)

Module I: TYPES OF MEALS & MENU (7 hours)

Breakfast-Introduction, Types, Service Methods,
Brunch, Lunch, Hi-Tea, Dinner, Supper, and others
Introduction to menu; Types-Ala Carte & Table D'hôte
Ala carte and TDH setups

Menu Planning, considerations, and constraints, Menu Terms
French Classical Menu- 11, 13, and 17 courses separately
Classical Foods & its Accompaniments with Cover
Indian regional dishes, accompaniments, and service

Module II: PREPARATION FOR SERVICE (7 hours)

Organizing Mise-en-scene
Organizing Mise en place
TYPES OF FOOD SERVICE – silver service, pre – plated service, Cafeteria service, room service, buffet service, gueridon service, lounge service

Module III: SEQUENCE OF SERVICE & Food & Beverage Terminology (05 hours)

Handling Table reservation
KOTs & BOTs Duplicate & Triplicate System, Computerized K.O.T's
The sequence of Food Service
Table Clearing Process
Billing Methods, Payment methods, and Cash

Module IV: CUSTOMER CARE AND HANDLING SITUATIONS (05 hours)

Unavailability of Table/reservation
Wrong Order Taking, Handling Unavailability of Food items
Handling Special Requests

Order Delays, Spillages, Return Food
 Lost and found properties
 Illness
 Drunken Guest, Unethical appearance of Guest
 Dealing with children and Infants
 Handling specially able, Old age guest

Module V: TOBACCO & CIGARS (06 hours)

History
 Processing for cigarettes, pipe tobacco & cigars
 Cigarettes – Types and Brand names
 Pipe Tobacco – Types and Brand names
 Cigars – shapes, sizes, colors, and Brand names
 Care and Storage of cigarettes & cigars

Objective(s):

The objective of the course is to learn different types of menu services, KOT analysis, and service of hot and cold non – alcoholic beverages.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

- CO 1: Discuss the different types of breakfast and other meals layout and tray set up with service techniques sequence (Understand)
 CO 2: Understand and demonstrate the different types of service provided in restaurants as per types of menus provided in 5star hotels in different food outlets. (Understand)
 CO 3: Identify different aspects of the control method used in restaurants (Knowledge)
 CO 4: Analyze Food and beverage departments by using KOT (Analyze)
 CO 5: Develop & demonstrate service of cold & hot non-alcoholic beverages. (Create)

PRACTICAL

Writing a Menu
 Breakfast Table Lay-out.
 TDH & A la Carte Cover lay-out.
 Receiving the guests
 Sequence of Service
 Taking an Order of Food & Making a KO T.
 Table Service, Practice of meet greets and repeats.
 Clearing, Crumbing, Presenting the bill

Service of Cold & Hot - Non-Alcoholic Beverages, Cigar and cigarettes

HADB200T: IN- ROOM DINNING & BEVERAGES

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s)

The objective of the course is to learn the concept of wine and beers and other fermented beverages and the service procedures for room service department.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain the operation of the room service department. (Understand)

CO 2: Understand the concepts of wine making process, viticulture wine-based beverages. (Understand)

CO 3: Identify & describe the beer production procedure and classify beer. (Knowledge)

CO 4: Analyze and classify other fermented beverages (Analyze)

CO 5: Develop suggestive selling techniques & demonstrate order taking procedure (Create)

Module I: IN-ROOM DINING SERVICE (5 hours)

a. Introduction, general principles, and types care to be taken while dealing with active and passive guest

b. The cycle of Service, scheduling, and staffing, Forms and Formats, Order Taking, Suggestive Selling, breakfast cards, Time management- the lead time from order taking to clearance

Module II: ALCOHOLIC & NON-ALCOHOLIC BEVERAGES**(10 Hours)**

Definition & Classification of Alcoholic Beverages

Introduction to fermented beverages

Classification (Nourishing, Stimulating and Refreshing beverages)

Tea - Origin & Manufacture - Types & Brands

Coffee - Origin & Manufacture - Types & Brands

Juices and Soft Drinks

Cocoa & Malted Beverages - Origin & Manufacture

Module III: BEERS (05 hours)

Introductions to beer

A brief introduction to Beer Production

Types and Brands – Indian and International

Module IV: WINE (05 Hours)

Introduction, Grapes (Varieties) viticulture vinification, Classification, Wine making, Storage, Brand Names.

Module V: AROMATIZED BEVERAGES & SAKE (08 Hours)

Definition, Types- Wine based & spirit-based

Usage and storage

Introduction, definition, manufacturing, Storage & Brands of SAKE

Suggested Readings

COURSE CODE: IN – ROOM DINNING & BEVERAGES PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn the concept of arranging buffet setups & demonstration of preparing and serving beverages and cold, carved meats & salads.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain the application and able to prepare Flambé Dishes (Understand)

CO 2: Identify and apply the concepts of Banquet Service and Bar Setup operations (Knowledge)

CO 3: Analyze & demonstrate beverage services (Analyze)

CO 4: Create & execute buffet setups (Create)

Practical

Service of Spirits

Service of Wine

Service in Guest Room

Preparing Function prospectus

Different types of buffet setup

Preparations of Flambé dishes, Carving, Salad

Preparation/Demonstration of Classic and modern Cocktail

HAIG202T: INDIAN GASTRONOMY

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the history & cooking techniques of Indian foods and its regional variations.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain the history & Heritage of Indian Regional Gastronomy (Understand)

CO 2: Discuss the various Regional & specialty cooking in Indian Cuisines (Understand)

CO 3: Identify & explain the knowledge on Dum cooking and Tandoor Cooking (Knowledge)

CO 4: Analyze the History and cooking of Indian Sweets (Analyze)

CO 5: Develop & explain the kitchen layout and functioning of Indian kitchen organization (Create)

Module I: Basics of Indian Cuisine (6 hours)

Introduction to Indian cuisine
Masalas: classical blends, varieties and composition
Indian herbs and spices
Introduction to basic gravies of India
Factors affecting the varieties in Indian regional cuisine

Module II: Indian kitchen layout & Organization (04 hours)

Duties and responsibilities of Indian kitchen brigade
Different Indian kitchen layouts
Equipments used in Indian volume catering establishments

Module III: Regional cuisine in India (10 hours)

Northern India: Kashmir, Punjab, Rajasthan
Eastern India : Bengal, Assam, Tripura, Mizoram, Nagaland, Manipur, Arunachal Pradesh, Meghalaya
Western India: Gujarat, Maharashtra
Southern India: Tamil Nadu, Kerala, Andhra Pradesh, Telangana
Central India: Madhya Pradesh, Uttar Pradesh, Bihar

Module IV: Gastronomic specialties and cooking in India (04 hours)

Indian street foods – Introduction, types
Festival cooking – Introduction, types, importance
Dum Cooking – Introduction, Origin, equipments used & classical dishes
Tandoor - Introduction, Origin, equipments used & classical dishes

Module V: Indian Mithai (06 hours)

Introduction
Regional variation in Indian Mithai – Ingredients, technique, types
Classical dishes – Names & description.

HABO204T: BAR OPERATIONS & OUTLET MANAGEMENT

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the layout, work scenario, and various cocktails prepared in Bar's of food outlets and the concept of function catering.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand and describe the layout of functional areas (Understand)

CO 2: Identify the concepts of function catering in the hotel industry. (Knowledge)

CO 3: Understand the gueridon service origin, specialty and their preparation. (Understand)

CO 4: Analyze& Illustrate bar operations (Analyze)

CO 5: Develop and demonstrate different Cocktail preparations (Create)

Module I: PLANNING & OPERATING VARIOUS F&B OUTLET (10 hours)

The physical layout of functional and ancillary areas, Objective of a good layout

Steps in planning, Factors to be considered while planning

Calculating space requirement

Various set ups for seating

Planning staff requirement

Menu planning, Constraints of menu planning

Selecting and planning of heavy-duty and light equipment

Requirement of quantities of equipment required like crockery, Glassware, Cutlery - steel or silver, etc.

Planning Décor, furnishing fixtures, etc.

Module II: FUNCTION CATERING (06 Hours)

Banquets

Banquet protocol

Informal banquet

Buffets

Module III: GUERIDON SERVICE (08 hours)

History of gueridon

Definition

General consideration of operations

Advantages & Dis-advantages

Types of trolleys

Factor to create impulse, Buying – Trolley, open kitchen

Gueridon equipment

Common preparations, flambé dishes, Carving, Salad making, etc., Trolley service - Beverages, Starters, Desserts, etc.

Module IV: BAR OPERATIONS (06 Hours)

Types of Bars

Cocktail

Dispense

Area of Bar

Front Bar

Back Bar

Under Bar (Speed Rack, Garnish Container, Ice well, etc.)

Bar Stock

Bar Control

Bar Staffing

Opening and closing duties

Module V: COCKTAILS & MIXED DRINKS (07 hours)

Definition and History

Classification

Recipe, Preparation, and Service of Popular Cocktail

HABO205L: BAR OPERATIONS & OUTLET MANAGEMENT PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn the briefing standards of hospitality sector and demonstrate the skills of serving alcoholic beverages including cocktails.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explore the set up tray and trolley lay up for room service (Understand)

CO 2: Analyze& demonstrate the knowledge for taking orders (Knowledge)

CO 3: Analyze& demonstrate service standards for serving Beer, Wines and cold & hot non-alcoholic beverages. (Analyze)

CO 4: Create & Explain the importance of conducting briefing and de-briefing. (Create)

Practical

Understanding Room Service Amenities, Room Service equipments

Room Service Tray & Trolley Lay-out

Functional Layouts for room service

Role play: Knocking & opening the guest door, wishing the guest, placing tray, checking order, presenting the bill, greeting at the exit.

Order taking on the telephone 7. Set-up for In Rooms.

Conducting Briefing/De-Briefing.

Taking an Order & Service of Beer, Other Fermented & Brewed Beverages.

Taking an order & Service of –Sparkling, Aromatized, Fortified, Still Wines. Order of service (starting with wine approval

From the host, wrapping the bottle with the napkin, etc.)

Opening different types of wine bottles. (Different types of corkscrews) 13. Use of different glasses, holding & carrying glasses

14. Set up a table with a Prepared Menu with wines.

HAQF206T: QUANTITY FOOD PRODUCTION

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the concept of bulk cookery and various types of menus associated with bulk cookery **COURSE / LEARNING OUTCOMES:**

At the end of this course student will be able to:

CO 1: Explain the requirement of equipments for volume feeding. (Understand)

CO 2: Discuss the concepts of bulk cooking and banqueting menus. (Understand)

CO 3: Identify & conceptualize all aspects regarding the institutional and industrial catering (Identify)

CO 4: Analyze, evaluate, analyze and interpret theoretical and practical skills of usage of different commodities in the kitchen (Analyze)

CO 5: Develop & explain the quantity purchase system. (Create)

Module I: QUANTITY FOOD PRODUCTION EQUIPMENTS (08 hours)

Equipment required for mass/volume feeding

Heating and cooling equipment

Care and maintenance of equipment

Modern developments in equipment manufacture

Module II: MENU PLANNING (10 Hours)

Basic principles of menu planning-recapitulation

Points to consider in menu planning for various volume feeding outlets such as Industrial, Institutional, Mobile Catering Units

Planning menus for School/ College students, Industrial workers, Hospitals, Outdoor parties, Theme dinners, Transport facilities, cruise lines, airlines, railway Nutritional factors

Module III: INDENTING (08 hours)

Principles of Indenting for volume feeding

Portion sizes of various items for different types of volume feeding

Modifying recipes for indenting for large scale catering

Module IV: PLANNING (08 Hours)

Principles of planning for quantity food production concerning Space allocation, Equipment selection, and Staffing

Module V: VOLUME FEEDING (10 Hours)

Institutional and industrial Catering

Hospital Catering,

Highlights of Hospital Catering for patients, staff, visitors Diet menus, and nutritional requirements

Off-Premises Catering, Problems associated with off-premises catering

Reasons for growth and development Menu Planning and Theme Parties

Concept of a Central Production Unit

Mobile Catering

Characteristics of Rail, Airline (Flight Kitchens and Sea Catering)

Quantity Purchase & Storage Introduction to the purchasing system

HAFO208T: FRONT OFFICE MANAGEMENT

(2 Credit – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the property management system and front desk operations along with the responsibilities of night auditor.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain and describe the entire property management system and the importance of computer in front office. (Understand)

CO 2: Identify and apply the entire check-in and check-out procedure of guest. (Knowledge)

CO 3: Analyze the process of settling bills of the guests, accounting procedures, handling front office cash and foreign exchange. (Analyze)

CO 4: Develop and analyze the idea about the night auditing and the job responsibilities of the night auditor. (Create)

Module I: PROPERTY MANAGEMENT SYSTEM (08 hours)

Importance of Computer in Front Office

Introduction to PMS

PMS application in Front Office (Reservation, Front Desk, Room, Cashier, Night Audit, set up, Reporting, back-office

Module)

Different PMS systems

Module II: CHECK-IN AND CHECK-OUT PROCEDURE (12 Hours)

Check-in Procedure in different situations like: - guest having confirmed reservation, Walk-in Guest, Group/crew, Scanty Baggage Guest, International Travelers, Club floor guest

Check out activity at various desks: - Bell Desk, lobby, Reception, Cashier

Different Methods of Settlement: -Cash, Credit Card, Cheques, Travel's cheques, Bill to company, Combined settlement method, checking of mini bar and taking of guest feedback.

Check out options: - On Desk Express Check out, Self-Check out Forms & Formats

Module III: MANAGING CASH & CREDIT (08Hours)

Front office Accounting Cycle

Credit control process in various cases: - guest pay by Credit Card, Travel agent voucher, airline, Scanty baggage, Credit control during the stay, credit facility to companies, check-in tour group. Problems may arise in credit control

The process required in cash Control

Handling Foreign Exchange

Module IV: NIGHT AUDITING (08 Hours)

Importance of Night Auditing,

Duties & Responsibility of Night Auditor

Common Revenue Centers of a Hotel

Basis steps involved in preparing Night Audit: - Complete posting, reconcile room status discrepancies, verify room rates, verify no show reservations, Cash Deposit, Clear & Back up the system, Distribute report

Vouchers/Folios/Ledgers/Allowances/Reports

HARP300T: RESTAURENT PLANNING & MANAGEMENT

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn & demonstrate various forms and formats required to maintain in front desk .

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss in-depth understanding of planning and operating a restaurant. (Understand)

CO 2: Identify the different concepts of catering operations. (Knowledge)

CO 3: Understand menu management and material management. (Understand)

CO 4: Analyze& illustrate inventory control. (Analyze)

CO 5: Develop the budget of the department. (Create)

Module I: RESTAURANT PLANNING (10 hours)

The physical layout of functional & ancillary areas

Objectives of a good layout,

Steps in planning

Factors to be considered while planning, calculating space requirements

Various set-ups for sitting,

Planning staff requirements,

Menu planning

Selection of equipment, lighting, fixtures, crockery, cutlery, etc.

Module II: MENU MANAGEMENT (08 Hours)

Introduction, Types of Menus, Menu Planning Considerations & Constraints

Menu Costing and Pricing

Menu Merchandising, Menu Engineering

Menu Fatigue, Menu as an In-House Marketing Tool.

Module III: MATERIALS MANAGEMENT (04 Hours)

Introduction, Necessity & Function and Techniques

Classification and Technology used in materials management.

Module IV: INVENTORY & BUDGETARY CONTROL (14 hours)

Importance, objectives, methods, levels & technique

Perpetual inventory, monthly inventory, pricing of commodity, comparison of physical and perpetual inventory
 Introduction, Objective
 Budgetary Control Process, Stages in the preparation of Budgets
 Budgeting for F&B Operations,
 Variance Analysis.

HARP301L: RESTAURENT PLANNING & MANAGEMENT PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn how to prepare duty roasters, layouts of different types of food outlets and Managerial skills to manage them.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

- CO 1: Understand the layout plan for different food outlets. (Understand)
 CO 2: Identify & analyze staff requirements and make a duty roaster for implementation. (Knowledge)
 CO 3: Analyze & explain and demonstrate operations of the restaurant, bar, and special events (Analyze) CO 4: Develop the skills to familiarize with different cocktails and preparation methods. (Create)

Practical

F&B Staff Organization-Class Room Exercise (Case Study method)
 Developing Organization Structure of various Food & Beverage Outlets
 Determination of Staff requirements in all categories
 Making Duty Roster
 Preparing Job Description & Specification
 Conducting Briefing & Debriefing
 Restaurant, Bar, Banquets & Special Events
 Drafting Standard Operating Systems (SOPs) for various F & B Outlets
 Supervising Food & Beverage operations
 Preparing Restaurant Log
 Designing & setting the bar
 Preparation & Service of Cocktail & Mixed Drinks

HAGC302T: GARDE MANGER & CONFECTIONARY

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn different layout and procedures require maintaining the standards in garde Manger and confectionary sections of commercial kitchens.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the layout and use of equipment in the larder section of the kitchen. (Understand)

CO 2: Understand the preparation of charcuterie. (Understand)

CO 3: Identify, compare and translate between appetizer and garnishes (Knowledge)

CO 4: Analyze the basic icing and topping terms with special reference to patisserie (Analyze)

CO 5: Develop & illustrate different sandwiches with making and storing methods (Create)

Module I: LARDER & CHARCUTERIE (06 hours)

Layout & equipment

Terms & larder control

Duties and responsibilities of the larder chef

Sausages & forcemeats

Brines, cures & marinades

Ham, bacon & gammon

Galantines & pate

Module II: APPETIZERS & GARNISHES (08 hours)

Classification of Appetizers

Examples of Appetizers

The historic importance of culinary Garnishes

Explanation of different Garnishes

Module III: SANDWICHES (08 Hours)

Parts of Sandwiches

Types of Bread

Types of filling – classification

Spreads and Garnishes

Types of Sandwiches

Making of Sandwiches

Storing of Sandwiches

Module IV: CAKE (06 Hours)

Introduction, types of bases, flavours, garnishes, tools and equipment & commodities

Module V: ICINGS & TOPPINGS (04 hours)

Varieties of icing, Using of Icings Difference between icings & Toppings

Suggested Readings

HAGC303L: GARDE MANGER & CONFECTIONARY PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn & demonstrate various preparations of garde manger and confectionaries.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Demonstrate various types of sandwiches, sausages, forcemeats (Understand)

CO 2: Identify & relate different desserts (Knowledge)

CO 3: Analyze, explain and demonstrate the different bakery & confectionary-making procedures with the temperature required. (Analyze)

CO 4: Create various types of appetizers of various cuisines. (Create)

Practical

Various preparations of sandwiches

Various preparations of sausages

Various preparations of forcemeats

Various preparations of desserts from world cuisine.

Different varieties of Bread

Different varieties of Chocolate,

Different varieties of Meringues,

Different varieties of Frozen Dessert.

Various preparations of Appetizers – Indian cuisine

Various preparations of Appetizers – French cuisine

Various preparations of Appetizers – Italian cuisine 12. Various preparations of Appetizers – Chinese cuisine

SUGGESTED MENU:

<u>Exp 1 (sandwiches)</u> BLT Chicken Club Cheese Potato Grilled Pinwheel sandwich Ribbon sandwich	<u>Exp 2(Sausages)</u> Breakfast sausages Cajun Sausages Hot Italian sausages	<u>Exp 3 (Forcemeats)</u> Chicken & bellpapper rou-lade Chicken & Spinach terrine Prawn & garlic Pate'	<u>Exp 4 (Desserts)</u> Tiramisu Crepe Allemande Chocolate Mousse Lamingtons
<u>Exp 5 (Breads)</u> Focaccia Lavash Soda Bread Pita	<u>Exp 6(Chocolates)</u> Chocolate Sandesh Chocolate Marzipan Choco cashew Pudding	<u>Exp 7 (Meringues)</u> Pavlova Meringue cookies Macaroons	<u>Exp 8 (Frozen desserts)</u> Strawberry Sorbet Orange Sherbet Mango yoghurt

Exp 9 (Appetizers – Indian) Paneer Potli Mirchi Vada Chicken 65 Dahi Vada	Exp 10 (Appetizers - French) Salade Lyonnais Souffle Au Fromage Tapenade canape' Paillassons de courgettes	Exp 11 (Appetizers - Italian) Caprese salad Grilled veg Bruchetta Stuffed Dates Whipped ricotta	Exp 12 (Appetizers - Chinese) Egg Drop Soup Cong You Bing Baozi Cantonese spring rolls

HARB304T: REVENUE MANAGEMENT & BUDGETING

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the yield management and the concept of room revenue used in the front desk sectors of hospitality.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the Yield Management, its concept, rates, and different booking horizons and Statistical representations. (Understand)

CO 2: Identify the budgeting and forecasting and to analyze room revenue. (Knowledge)

CO 3: Create & describe and implement role plays of guest complaint handling. (Create)

Module I: YIELD/REVENUE MANAGEMENT (09 hours)

Yield in hotel industry

Methods of measuring hotel performance/yield

Elements and benefits of yield management

Challenges in Yield management

Yield management strategies

Measuring Yield

Module II: FORECASTING (07 Hours)

Concept of forecasting

Benefits of forecasting

Data/ records required for forecasting room availability

Module III: BUDGETING (07 hours)

Types of budget & budget cycle

Making front-office budget

Factors affecting budget planning

Capital & operations budget for front office

Refining budgets, budgetary control

Forecasting room revenue

Module IV: GUEST COMPLAINT HANDLING / PROBLEM SOLVING (07 hours)

Types of complain

Process, thumb rules

Common complaints / problems

Situation handling

HARB305L: REVENUE MANAGEMENT & BUDGETING PRACTICAL

(2 credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn & demonstrate different SOP's and files and formats regarding memberships, budgets & guest complains required in front desk of hospitality sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Explain the techniques of room up selling, enrolment in loyalty membership programs and maintain guest history (Understand)

CO 2: Identify & handle guest complain and different situations in front office. (Knowledge)

CO 3: Analyze & Construct operating budget, calculate staff requirements and allocate duties accordingly. (Analyze)

CO 4: Develop & implement all the SOP's of front office and list about different countries and their capitals, currency, flags chart etc. (Create)

PRACTICAL

Up selling of Rooms

Enrolment in loyalty membership programs

Role play on handling guest complain

Handling of inebriated guest, guest with special care, guest involved in inappropriate activity

Role of telephone operator in different situation

Maintaining guest history

Capitals, currencies, airlines and flags chart

Preparing operating budget for front office operation

Calculating staff requirement

Preparing duty rota's

Evaluation of SOP's

HHFB321P: TRAINING & DEVELOPMENT: FOOD & BEVERAGE SERVICE

(4 Credits – 120 hours) (L-T-P: 0-0-4)

Objective:

To provide industry exposure and hands-on training in various food and beverage service areas, enhancing students' operational skills, communication, and guest handling techniques.

COURSE / LEARNING OUTCOMES:

At the end of this course, the student will be able to:

- CO 1:** Understand the purpose and significance of industrial training in food & beverage service (Understand)
- CO 2:** Observe and analyze real-time service operations in areas like banquets, room dining, and bar (Analyze)
- CO 3:** Apply learned service skills and procedures during training in live F&B setups (Apply)
- CO 4:** Evaluate post-training improvements in communication, teamwork, and service skills (Evaluate)
- CO 5:** Design a training-based career path and development plan in the F&B sector (Create)

Module	Title	Hours	Focus
I	Restaurant Operations	50 hrs	Mise-en-place, sequence of service, styles of service, SOPs
II	Bar & Beverage Service	30 hrs	Mocktails, wine service, responsible alcohol service
III	Banquets & Events	30 hrs	Banquet setups, buffet layouts, service styles, BEO understanding
IV	Room Dining (IRD)	20 hrs	Order taking, tray setup, in-room guest interaction
V	Professional Conduct & Report Writing	30 hrs	Grooming, logbook, reflective journal, viva, report submission

HHGA322P: TRAINING & DEVELOPMENT: GASTRONOMY

(4 Credits – 120 hours) (L-T-P: 0-0-4)

Objective:

To immerse students in commercial kitchen operations to learn cooking, hygiene, teamwork, and gastronomy-based technical skills under real working conditions.

COURSE / LEARNING OUTCOMES:

At the end of this course, the student will be able to:

- CO 1:** Understand the objectives of kitchen training and the working structure of commercial kitchens (Understand)
- CO 2:** Demonstrate basic to intermediate culinary skills including hygiene, cutting, and cooking techniques (Apply)
- CO 3:** Analyze challenges and opportunities encountered during kitchen training (Analyze)
- CO 4:** Evaluate skill enhancement in terms of confidence, communication, and teamwork post-training (Evaluate)
- CO 5:** Plan and create dishes and food items using traditional and contemporary techniques (Create)

Module	Title	Hours	Focus
I	Hot Kitchen Training	60 hrs	Pre-prep, Indian gravies, mother sauces, regional cuisines
II	Bakery & Confectionery	30 hrs	Breads, cakes, pastries, modern plating
III	Hygiene, Sanitation & Reshuffle	30 hrs	Food safety, HACCP, leftover management
IV	Kitchen Management & Inventory	20 hrs	Portioning, indenting, wastage control

HHFO323P: TRAINING & DEVELOPMENT: FRONT OFFICE OPERATIONS

(4 Credits – 120 hours) (L-T-P: 0-0-4)

Objective:

To provide industry-based exposure in hotel front office operations and enable students to gain professional competence in guest relations, reservations, check-in/check-out procedures, communication, and front-office technology.

COURSE / LEARNING OUTCOMES:

At the end of this course, the student will be able to:

CO 1: Understand the structure, functions, and importance of front office operations (Understand)

CO 2: Perform basic guest handling tasks such as check-in, check-out, reservations, and billing (Apply)

CO 3: Analyze operational challenges in front office environments and propose solutions (Analyze)

CO 4: Evaluate improvements in communication, confidence, and professional behaviour post-training (Evaluate)

CO 5: Design a career plan and development strategy for front office roles (Create)

Module	Title	Hours	Focus
I	Guest Relations & Front Office Basics	50 hrs	Grooming, communication, telephone etiquette, guest engagement
II	Reservations & Guest Services	30 hrs	Reservation systems, OTA handling, check-in/check-out, up-selling
III	Front Office Technology	30 hrs	PMS usage (OPERA/IDS), cashiering, night audit basics
IV	Concierge & Lobby Operations	20 hrs	Bell desk, concierge services, luggage handling, lost & found

HAGT400T: MODERN TRENDS IN GASTRONOMY – I

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the modern advancement in the gastronomy sector and the benefits of research & development.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss and describe various global cuisines and modern aspects on gastronomy. (Understand)

CO 2: Identify and learn the benefits of gastronomic tourism (Knowledge)

CO 3: Analyze the concept of production management and its importance (Analyze)

CO 4: Develop skills and illustrate the research & product development in gastronomy and other modern trends (Create)

Module I: Global cuisine (14 hours)

Introduction – Italian, French, Mexican, Moroccan, Lebanese, Chinese, Thai, Japanese, Mediterranean.

Ingredients used, cooking techniques and specialty

International recipe and there description

Importance of global cuisine & ingredients – Health & sustainability

Module II: Ancient Grains & Super foods (06 hours)

Introduction – Ancient grains

Types , description, cooking techniques – Ancient grains

Health benefits from ancient grains

Introduction – Super foods

Types , description, cooking techniques – Super foods

Health benefits from Super foods

Module III: Gastronomic Tourism (8 hours)

Introduction, history & features

Types & categories

Benefits of gastronomic tourism

Gastronomic tourism – Designing

New trends in Gastronomic tourism

Module IV: Production Management (5 hours)

Kitchen organization

Allocation of Work Job Description, Duty Roasters

Production Planning, Production Scheduling

Production Quality & Quantity Control

Forecasting Budgeting, Yield Management

Module V: Research & Product development (06 hours)

Testing new equipment - Commercial and small equipments used in kitchen

Developing new recipes – Impact of modern trends, Themes, location, clients etc.

Food Trails – based on costing, nutritional value, calorie count, portion sizes

HAFO402T: MODERN TRENDS IN FRONT OFFICE – I

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the green practices and modern technologies used for the better services in the modern era of front desk procedures and data's for record keeping

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the quality of service as per their expectation with the help of various modern tools. (Understand)

CO 2: Explain the various technologies which have added to the modern techniques of Front Office functions. (Knowledge)

CO 3: Illustrate and examine the new concepts of vacation and accommodation ownerships. (Analyze)

CO 4: Identify the various implementations of green practices in Front Office (Create)

Module I: QUALITY SERVICE IN FRONT OFFICE (12 hours)

Lodging as a guest service business, developing a quality culture

Role of Manager in quality, determining guest service expectation,

Planning guest service process – recognizing basic concerns

Determining and delivering guest service expectations

EGQ and NPS

Recording Feedback

Post Departure Guest Relation

Module II: DIGITALIZATION (06 Hours)

Specialized mobile apps
AI and Hotel Chat bots
Self-check-in Desk Technology

Module III: TIMESHARE & VACATION OWNERSHIP (10 Hours)

Definition and types of timeshare options
Difficulties faced in marketing timeshare business
Advantages & disadvantages of timeshare business
Exchange companies -Resort Condominium International, Intervals International
How to improve the timeshare / referral/condominium concept in India- Government's role/industry role

Module IV: MODERN ACCOMMODATION CONCEPTS (06 Hours)

Benefits of Modern accommodation concepts
Examples of new conceptual hotels -Smart Hotels, Bunker Hotels, Tree House, Zostel, Under water Hotels, Glass Hotels etc.

Module V: GREEN PRACTICES (06 Hours)

Implementation of 3 R's (Reduce, Reuse, Recycle)
Eco-Bells
Contactless Check-in
No paper policy

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the concept and idea of new Indian cuisines and new developments in food industry (Understand)

CO 2: Identify the factors which leads to sustainability (Knowledge)

CO 3: Analyze the importance of media in food industry (Analyze)

CO 4: Develop your skills and illustrate the importance and challenges in food entrepreneurship. (Create)

Module I: Offbeat cuisines of India (10 hours)

A detailed study on – Uttarakhandi, Kathiawadi, Parsi , Mappila, Adivasi, Melenadu & Kokani cuisine

Traditional preparation methods

Utensils and accompaniments

Module II: Modern trends & developments (09 hours)

Lab grown meats

Plant based dairy products

Super foods

Micro greens

Edible flowers

Immune boosting foods

Meal kits

Seaweed consumption

Micro dose

Module III: Sustainability in gastronomy (08 hours)

Sustainability – Definition, importance, impacts on environment

Sustainable food cycle

Sustainable food cultivation & climate change- crops, livestock, marine

Role of NGO's, government and non government sector in sustainable food movements

Module IV: Media Importance in Gastronomy (09 hours)

Types of media benefits the gastronomy

Role of social media in gastronomy

Food photography

Food advertising

Food styling

Module V: Food entrepreneurship (08 hours)

Opportunities and challenges in food entrepreneurship

Food business opportunities in India

Research and development in food business

HAGY409L: MODERN TRENDS IN GASTRONOMY – II PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to demonstrate & learn the offbeat cuisines of India and newly developed concepts of gastronomy which supports sustainability and modern trends.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Demonstrate menus from offbeat cuisine of India (Understand)

CO 2: Identify & demonstrate recipes based on modern trends in gastronomy (Knowledge)

CO 3: Identify & demonstrate menu's which supports sustainability in gastronomy (Analyze)

CO 4: Develop the skills through innovations and research in gastronomy and create demo entrepreneurship ideas (Create)

Practical

Expt. 1: Various preparations from – Uttarakhand cuisine

Expt. 2: Various preparation from – Kathiawadi cuisine

Expt. 3: Various preparation from – Parsi cuisin

Expt. 4: Various preparation from – Mappila cuisine

Expt. 5: Various preparation from – Adivasi cuisine

Expt. 6: Various preparations from – Melenadu cuisine

Expt. 7: Various preparations from – Konkani cuisine

Expt. 8: Various preparations from – Micro greens

Expt. 9: Various preparations from – edible flowers

Expt. 10: Various preparations from – Immune boosting foods

Expt. 11: Various preparations from – Seaweeds

Expt. 12: Various preparations from – Plant based dairy

Expt. 13: Various preparations from – sustainable food menu

Expt. 14: Various preparations from – sustainable food menu

Expt. 15: Demo entrepreneurship ideas – Based on gastronomy

Expt. 16: Demo entrepreneurship ideas – Based on gastronomy

SUGGESTED MENU:

<u>Exp 1 (Uttarakhand cuisine)</u> Aloo gutuk Phannu Kumaoni Raita Arsa	<u>Exp 2(Kathiawadi cuisine)</u> Ringan no oro Lasaniyabateta Methithepla Adadiyapak	<u>Exp 3 (Parsi cuisine)</u> Chicken farcha Dhansak Patra nimachli Berry pulao	<u>Exp 4 (Mappila cuisine)</u> Unnakkaya Fish surkha masala Parottas Thalassary biriyani
<u>Exp 5 (Adivasi cuisine)</u> Dhuska Shukti Jhor Dubki tiyan Bothalbhaat	<u>Exp 6 (Melenadu cuisine)</u> Mango Rasam Carrot kosambari Pandi curry Akki roti	<u>Exp 7 (Konkani cuisine)</u> Sol kadhi Bombil fry Bharlivangi Caldine veg curry	<u>Exp 8 (Micro greens)</u> Spring salad Broccoli micro green soup Micro green pesto sandwich Lemon – garlic pasta with arugula
<u>Exp 9 (Edible flowers)</u> Edible flower Gazpacho Rose jam & strawberry Bruchetta Edible flower canapé	<u>Exp 10 (Immune boosting foods)</u> Chicken & turmeric soup Lentil stuffed sweet potatoes	<u>Exp 11 (Seaweeds)</u> Seaweed salad with sesame dressing Grilled chicken with seaweed butter Tofu & seaweed stir fry Seaweed risotto	<u>Exp 12 (Plant based dairy)</u> Strawberry & coconut milk shake Hot garlicky tofu Savory soy milk crepes

Squash blossoms with goat cheese	Pumpkin & broccoli curry Coconut rice		Almond milk pudding
<u>Exp 13 (Sustainable foodmenu)</u> Fish head & coconut root soup Leftover lentil croquettes Crispy chicken skin stew Candied lemon peel flavored rice	<u>Exp 14 (Sustainable foodmenu)</u> Cucumber peel pickles Sweet potato & carrot peel Pakora Bottle gourd peel chutney Bitter gourd peel Puri	<u>Exp 15 (Entrepreneurship ideas)</u> Students should develop their skills on food entrepreneurship in theory classes and come up with innovative recipes which can be used for revenue generation	<u>Exp 16 (Entrepreneurship ideas)</u> Students should develop their skills on food entrepreneurship in theory classes and come up with innovative recipes which can be used for revenue generation

OR**HAFR410T: MODERN TRENDS IN FRONT OFFICE – II**

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the modern rules, licenses & green certifications of newly developed concepts of front desk and hospitality sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Analyze the concept of home stay and find out about the licenses and rules and regulations to be followed in India. (Understand)

CO 2: Explain the various new technologies in reference to concierge of front office. (Knowledge)

CO 3: Summarize the various certifications which can be obtained for green practices in hotel industry and analyze the SOP's adopted towards safety and security of guest. (Analyze)

CO 4: Discuss various case studies on modern trends in front office and determine its implications and impact on hotel industry. (Create)

Module I: HOMESTAY (06 hours)

Concept of Homestay

Classification of Homestay

Homestay licenses, rules & Regulations in India

Module II: HIGH-TECH CONCIERGE TECHNOLOGY (06 Hours)

Virtual Tour

AI in Concierge

Examples of Hi-tech Concierge Technologies adopted by hotels worldwide

Module III: INTERNATIONAL CERTIFICATION OF GREEN PRACTICES (08 Hours)

Eco-leaf rating

Green Globe
Green Key
Nordic Swan rating
LEEDS

Module IV: MODERN SAFETY AND SECURITY IN FRONT OFFICE (08 Hours)

Modern Equipment used in Front Office
Key handling/ Safe Deposit
SOP of handling suspicious guest
SOP of handling single lady traveler
Change of SOP for guest handling post Covid-19

Module V: CASE STUDY (08 Hours)

Case Studies on various examples in relation to Front Office Trends

Suggested Readings

HAFR411L: MODERN TRENDS IN FRONT OFFICE – II (PRACTICAL)

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to demonstrate the modern standard procedures and uses of virtual orientation in the field of front desk area and hospitality.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

- CO 1: Explain the concept of virtual orientation of hotel and its facilities as well as orientation of the city. (Understand)
CO 2: Model itinerary of guest. (Knowledge)
CO 3: Apply SOP's of hygiene & sanitation and other standards procedures in front office as per requirements and analyze the applications of modern apps in various procedures. (Analyze)
CO 4: Create unique experience for guest together with construction of forms and formats. (Create)

PRACTICAL

- Expt. 1: Virtual Orientation of Hotel
Expt. 2: Virtual Orientation of city in which the hotel is situated
Expt. 3: Digital itinerary creation
Expt. 4: Post Covid-19 hygiene & sanitation in front office
Expt. 5: Application of modern apps and features in front office like voice technology etc
Expt. 6: Flexible check-in and check-out procedure

Expt. 7: Providing unique experience/wow experience

Expt. 8: Dealing with fake currencies

Expt. 9: Updated forms and formats

Expt. 10: Role play

HABS412T: MODERN TRENDS IN FOOD & BEVERAGE SERVICE –II

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the modern advancements in beverage outlets and new trending concepts of beverages.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the concepts of modern advancements in beverage outlets and trends (Understand)

CO 2: Identify & analyze the marketing strategies in beverage sector (Knowledge)

CO 3: Analyze and develop skills on modern trends in cocktails and Mocktails (Analyze)

CO 4: Develop the skills and illustrate the entrepreneurship options in beverage sector (Create)

Module I: Innovation's in Beverage sector & outlets (08 hours)

Robotics service innovation

Companion beverage bars

Advance beverage productions

Artificial Intelligence

Module II: Modern trends & developments in beverages (07 hours)

Herbal & Botanical flavours in beverages

Sober trend – Low and non alcoholic drinks

Functional drinks

Alternative spirits

Fermented beverages & teas

Module III: Marketing strategies in Food & Beverage (08 hours)

Customer loyalty programs

Digital presence in social media

Paid media promotions

Search engine optimization

Module IV: Modern cocktail & Mocktail trends (08 hours)

Canned cocktails & Mocktails

Throw back cocktails

Two spirit cocktails

Modern garnish techniques

Module V: Beverage entrepreneurship (07 hours)

Opportunities and challenges in beverage entrepreneurship

Beverage business opportunities in India
Research and development in beverage business

COURSE CODE: MODERN TRENDS IN HOUSEKEEPING – II

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the modern advancements in rooms division and new trending concepts of rooms and the management skills.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Describe the importance of employee training (Knowledge)

CO 2: Identify the modern trends of hospitality housekeeping (Understand)

CO 3: Point out software utility in housekeeping (Analyze)

CO 4: Reframe the outsourcing process (Analyze)

Module I – Training & Motivation (08 hours)

Training methods
Disease and infection control
Covid sanitation training
Fire safety training and drills

Module II – Modern laundry operations (05 hours)

Eco friendly chemicals
Optimization of laundry settings
Outsourcing laundry practices
Water treatment
Recycling water

Module III – Safety & Security (08 hours)

Modern technologies for security
Uses of AI for guest security
Usage of IP cameras for face tracking
Modern guest security practices
International standards

Module IV – Outsourcing Services (08 hours)

Importance
Different outsourcing services
Cost efficiency
Outsourced employment

Module V – Case Study (06 hours)

Case study 1
Case study 2
Case study 3

HAGH104T: BASICS OF GASTRONOMY & HYGIENE PRACTICES

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the basic and introductory knowledge of gastronomy sector of hospitality.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the hygiene and skills required in workplace. (Understand)

CO 2: Identify and analyze basic food commodities and their preparations (Knowledge)

CO 3: Analyze the basic knowledge of baking and breads. (Analyze)

CO 4: Demonstrate the safety procedures in handling kitchen equipment's (Create)

CO 5: Develop the operation flow of the food production department (Create)

Module I: INTRODUCTION TO GASTRONOMY & HIERARCHY (08 hours)

Attitudes, behaviour & personal hygiene in the kitchen

Uniforms & protective clothing

Aims and objectives of cooking food

Various textures & consistencies

Classical & Modern Brigade

Duties and responsibilities of various chefs

Module II: METHODS OF COOKING FOOD (05 hours)

Methods of Cooking: Roasting, Grilling, Frying, Baking, Broiling, Poaching, Boiling

Principles of each of the above

Care and precautions to be taken

Selection of food for each type of cooking

Module III: Introduction to Bakery (05 hours)

Introduction & types of ovens

Basic bakery ingredients – uses, importance

Different types of breads – Description, country of origin

Module IV: COMMODITIES & TERMS USED IN GASTRONOMY (06 Hours)

Cuts & classification of vegetables

Classification of fruits

Egg cookery

Stocks & its uses

Thickening & Raising agents

List of culinary terms & their explanation

Module V: Food Hygiene (05 Hours)

Food & its relation to health

Food allergy and precautions

General Principles of Food Hygiene

Food Hazards & risk

Types (Infections and intoxications) & its preventive measures

HACCP (Basic Principle and implementation)

HACB106T: CULINARY & BAKING SKILLS

(2 Credits: 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn & develop theoretical skills of various kinds of soup, sauces & stocks and various kinds of meat & fish cookery.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the basic recipes and outline the different Soups and Sauces preparations (Understand)

CO 2: Identify different food commodities. (Knowledge)

CO 3: Analyze the various processes of cooking methods required for fish & meat cookery (Analyze)

CO 4: Develop & illustrate meat and fish cookery (Create)

CO 5: Identify various types of bakery & confectionary items (Knowledge)

Module I: Soups (05 hours)

Definition, Importance, classification – Broth, Bouillon, puree, cream, velouté, chowder, bisque, consommé

Cold soups

International soups

Garnishes and accompaniments

Module II: Sauces (04 hours)

Definition, Importance, classification of sauces and mother sauces

Derivatives of mother sauces

Contemporary & Proprietary sauces

Difference between sauce and gravy

Module III: FISH COOKERY (04 hours)

Introduction to fish cookery

Classification of fish with examples

Cuts of fish with menu examples

Selection of fish and shellfish

Effects of heat on the cooking of fish

Module IV: MEAT COOKERY (06 hours)

Introduction to meat cookery

Cuts

Variety meats

Poultry

Menu examples of each

Module V: Basic Bakery & confectionary (05 hours)

Muffins – Introduction, types

Cookies & Doughnuts – Introduction, types

Pastries- Types and uses

Module VI: Food commodities (06 hours)

Nuts – classification & uses

Fruits – classification & uses

Herbs – types & uses

Pulses & cereals – types and uses.

CO 3: Create & demonstrate on different surface cleaning – glass, metal and wood (Create)

PRACTICAL

- Expt. 1: Identification of room status and outline of various reports generated in room division – room status report, arrival report, discrepancy report, occupancy report
- Expt. 2: Handling room reservation
- Expt. 3: Role play of key handling and safety deposit locker
- Expt. 4: Role play of Room Movement
- Expt. 5: Role play of handling guest wakeup call
- Expt. 6: Role play of handling guest telephone at control desk
- Expt. 7: Role play on lost and found
- Expt. 8: Cleaning of different surfaces - Glass cleaning, Metal Cleaning, Wood Cleaning
- Expt. 9: Practical involving following activities- Scrubbing, polishing, wiping, washing, rinsing, swabbing, mopping, sweeping, brushing, buffing
- Expt. 10: Practical involving following activities- Scrubbing, polishing, wiping, washing, rinsing, swabbing, mopping, sweeping, brushing, buffing

HASB212T: HOUSEKEEPING SUPERVISION & BUDGETING

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the supervision skills and budget control methods used in the house-keeping department of hospitality sector.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the basic contents of housekeeping and guestrooms (Understand)

CO 2: Analyze the supervision process of housekeeping (Analyze)

CO 3: Develop & reframe the budgetary control methods (Create)

Module – I: Standard Contents of a Guest room (08 hours)

Guestroom furniture

Furniture arrangement

Guestroom fixture and fittings

Beds, mattresses and bedding

Soft furnishing

Guestroom accessories

Placement of guest supplies

Module – II: Supervision in Housekeeping (07 hours)

Role of a supervisor

Specific functions of supervisors

Importance of a supervisor

Module – III: Housekeeping Control Desk (07 hours)

Coordination with other departments

Handling telephone calls

Paging systems and methods

Situation handling

Room move / Room shift

Module – IV: Budgeting for housekeeping expenses (08 hours)

Types of budget
 Housekeeping expenses
 Budget planning process
 Income statement of the rooms division
 Controlling expenses
 Inventory control and stock – taking
 Purchasing

HASB213L: HOUSEKEEPING SUPERVISION & BUDGETING PRACTICAL

(2 Credits – 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn & demonstrate the skills required to understand the function of chambermaid's trolley and cleaning agents & equipments.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Developing skills for the loading of a chambermaid's trolley (Understand)

CO 2: Identify & explain a guestroom layout (Knowledge)

CO 3: Analyze & understand the usage of cleaning agents and equipment (Analyze)

Practical

Familiarising guest room amenities

Identification of housekeeping equipment (Manual / Mechanical)

Familiarising with chambermaid's trolley

Cleaning of different surfaces

Practical involving following activities- Scrubbing, polishing, wiping, washing, rinsing, swabbing, mopping, sweeping, brushing, buffing

Stain removal

Practical activities involving the usage of cloths and their types, abrasives, polishes, chemical agents, and commercially available products

HAHM310T: ADVANCED HOUSEKEEPING MANAGEMENT

(2 Credits: 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn various aspects of decorations required in rooms & focused areas and causes & prevention aspects of safety and security.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Discuss the basics of ancillary activities (Understand)

CO 2: Analyze the security systems of a hotel (knowledge)

CO 3: Develop & identify the decorations of the department (Create)

Module – I: Linen and Laundry (05 hours)

The linen and laundry room

Storage, exchange, par stock, linen control, laundry process

Dry cleaning

Handling guest laundry

Uniforms and sewing room

Module – II: Safety and Security (08 hours)

Work environment safety

Potential hazards in housekeeping

Fire prevention and fire safety

First aid

Crime prevention

Medical emergencies

Scanty baggage

Lost and found

Module – III: Interior designing (07 hours)

Basic types of design

Elements and principles of design

Design for physically challenged

Colour and lighting

Flooring

Carpets and floor maintenance

Window and window treatment

Module – IV: Flower Arrangement (04 hours)

Flower arrangement basics

Designing flower arrangement

Japanese / oriental flower arrangement

Common flowers and foliages

HAHM311L: ADVANCED HOUSEKEEPING MANAGEMENT PRACTICAL

(2 Credits: 60 hours) (L-T-P: 0-0-2)

Objective(s):

The objective of the course is to learn & demonstrate the concept of interior decorations, bed making & flower arrangements.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Develop skills & construct a model room with various concepts of interior decoration (Understand)

CO 2: Analyze & demonstrate the process of bed-making (Analyze)

CO 3: Create & illustrate various flower arrangement techniques (Create)

Practical

Flower arrangement

Making floor plans, wall elevations, and templates

Creating a model of a guest room / public area with interior decoration themes

Cleaning of guestroom

Bed making & Turn-down service

Mini-bar handling

HHPR325P: TRAINING REPORT PRESENTATION

(4 Credits – 120 hours) (L-T-P: 0-0-4)

Objective:

To document, reflect upon, and present the knowledge and skills acquired during industrial training across all departments of hospitality.

COURSE / LEARNING OUTCOMES:

At the end of this course, the student will be able to

CO 1: Analyze and document industrial exposure in core hospitality departments: F&B, Culinary, Front Office, and Housekeeping (Analyze)

CO 2: Apply knowledge from classroom learning to real-time work settings through logbook entries and weekly reflections (Apply)

CO 3: Evaluate the company culture, SOPs, and administrative processes from an operational perspective (Evaluate)

CO 4: Create a comprehensive training report highlighting tasks performed, skills gained, and observations (Create)

Module	Title	Hours	Focus
I	Departmental Log-book	40 hrs	Daily record of activities (F&B, kitchen, front office, housekeeping)
II	Reflective Report Writing	30 hrs	Introduction to the property, department-wise learning, SOPs followed
III	Visual Documentation	20 hrs	Property images (if permitted), task photos, learning outcomes
IV	Presentation Preparation	10 hrs	Viva voice, slide prep, report polishing
V	Final Viva and Presentation	20 hrs	Report submission and oral defense before panel

HABT408T: BASICS OF TOURISM

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the basic knowledge about the tourism sector in hospitality with its different aspects.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Contextualize tourism within broader cultural, environmental, and economic dimensions of society. (Knowledge)

CO 2: To outline the resources of tourism and different aspects of tour operations. (Understand)

CO 3: Explain the diverse nature of tourism, including culture and place, global/ local perspectives, and experience design and provision. (Understand)

CO 4: Examine the different elements of geography and the relationship with tourism. (Analyze)

CO 5: Illustrate the tour operations (Apply)

Module I: CONCEPT OF TOURISM (06 hours)

Origin, objectives, Elements, Scope & Nature of tourism

Job opportunities and employment generation in the tourism Industry

Module II: TOURISM PRODUCTS AND RESOURCES (08 hours)

Architectural heritage

Culture & Fairs and festivals of India

Natural and other tourism resources

Module III: TOUR OPERATIONS (08 hours)

Meaning & Definition

Types of Tourists: Inbound, Outbound & Domestic.

Tour Packaging—definition, components of a tour package

Types of Package Tour: Independent Tour, Inclusive Tour, Escorted Tour, Business Tour

Guides & escorts– The role and function Qualities required to be a guide or escort

Module IV: ITINERARY PLANNING (08 hours)

Steps to planning a Tour, Planning Route map

Transport booking–reservation,

Accommodation–Reservation & Food facilities

Tour Costing

Module V: SOCIO-ECONOMIC IMPACT OF TOURISM (07 hours)

Impact of tourism on culture

People to people contact enhancement

Environmental hazards

HARM409T: RESEARCH METHODOLOGY

(2 Credits: 30 hours) (L-T-P: 2-0-0)

Objective(s):

The objective of the course is to learn the basic knowledge about the research work and different approaches, process and methods of data collection in research work.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the idea of conducting a research (Explain)

CO 2: Analyze the different approaches of a research process (Analyze)

CO 3: Explain the research concepts (Understand)

CO 4: Define the different methods of data collection and different research designs (Knowledge)

Module I – Introduction to Research (06 hours)

Define research

Objectives of research

Types of research

Significance of research

Research process

Criteria's of a good research

Module II – Defining Research Problem (04 hours)

Research problem

Selecting the problem

Necessity of defining the problem

Techniques involved in defining a problem

Module III – Research Design (05 hours)

Meaning of research design
Need for research design
Features of a good design
Concepts of research design
Principles of research design

Module IV – Sampling Design (04 hours)

Census and sample survey
Steps in sample design
Criteria's of selecting a sampling procedure
Types of sample design

Module V – Data Collection (05 hours)

Collection of primary data
Observation method, interview method, questionnaire
Methods of data collection
Collection of secondary data
Primary data vs. Secondary data

HAOB410T: ORGANIZATIONAL BEHAVIOUR

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the basic knowledge about the behaviours & approaches of employees and employers towards an organization.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the organizational theory and structure (understand)

CO 2: Identify behavioural and individual perspectives (Knowledge)

CO 3: Analyze focus group behaviour (Analyze)

CO 4: Reframe different cultures and developments in an organization (Evaluate)

Module – I: Organizational theory (10 hours)

Introduction to organization
Organization theory
Organization structure
Effectiveness of organizational structure

Module – II: Organizational behaviour and individual perspective – I (08 hours)

Overview of organizational behaviour
Individual behaviour and learning
Perception

Attitudes and values

Module – III: Organizational behaviour and individual perspective – II (08 hours)

Personality and emotions

Stress management

Motivation

Job design and Job satisfaction

Module – IV: Group behaviour (06 hours)

Group formation and structure

Communication

Conflict management

Team building and leadership

Power and politics

Module – V: Organizational culture and development (10 hours)

Organizational culture and climate

Organizational change

Organizational development

Emerging trends in organizational behaviour

Suggested Readings

HAIR108L: INTRODUCTION TO ROOMS DIVISIONS

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the history and classifications of hotel sector of hospitality and the organizational chart along with duties and responsibilities of various levels in room divisions.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the history of the Hospitality Industry and the core areas of rooms division and analyze its co-ordination with other departments. (Understand)

CO 2: Analyze the classification of hotels and the different types of guest rooms and accommodations. (Analyze)

CO 3: Develop the layout of front office/housekeeping, organizational chart, duties & responsibilities and personality traits of room division staff. (Create)

Module I: INTRODUCTION TO HOSPITALITY INDUSTRY & ROOMS DIVISION (06 hours)

Hospitality and its origin

Hotels, their evolution, and growth

A brief introduction to hotel core areas with special reference to Rooms Division

Coordination with other departments

Module II: CLASSIFICATION OF HOTELS AND HOTEL ROOMS (12 Hours)

Size

Star

Location & clientele

Ownership basis

Independent hotels

Management contracted hotel

Chains

Franchise/Affiliated

Supplementary accommodation

Time shares and condominium

Types of Guest Rooms

Module III: LAYOUT AND ORGANIZATIONAL CHART OF ROOM DIVISION (12 hours)

Layout of Front Office and Housekeeping department – Small, Medium & Large hotels

Organizational Chart of Housekeeping and Front Office – Small, Medium & Large hotels

Duties and responsibilities of staff

Personality Traits

HAIR108L: INTRODUCTION TO ROOMS DIVISIONS PRACTICAL

Objective(s):

The objective of the course is to learn the identification of various rooms along with hygiene standards and importance of communication and etiquettes.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the importance of hygiene standards and basic manners required for guest services. (Understand)

CO 2: Identify different equipment and furniture used in room division (Knowledge)

CO 3: Analyze & implement communication (verbal & non-verbal) for various guest services. (Analyze)

CO 4: Develop different types of guest rooms and identify the supplies and their positions.
(Create)

PRACTICAL

Basic Manners, Grooming & Hygiene Standards, its importance,
Room Division Communication (verbal/non-verbal) - Body language, Gestures, Facial expression, eye contact, voice

Identification of equipment and furniture used in rooms division.

Telephone etiquettes, Dialogues

Welcoming Guest

Escorting, Message handling, Familiarization with guest room.

Guest Room Supplies and Position

Layout of different types of guest room

Team Building

HAFA109L: FUNCTIONAL AREAS & CLEANING AGENTS

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn the basic concepts of rooms divisions which are very necessary for day to day smooth function in room division.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the basic functional areas of room division and outline the layouts of the areas. (Understand)

CO 2: Identify & recall and describe the entire guest cycle. (Knowledge)

CO 3: Analyze & elaborate on the basic concept of tariff decisions, pricing of rooms and meal plans. (Analyze)

CO 4: Develop & analyze the different types of cleaning techniques, cleaning equipments and cleaning agents along with their care and maintenance. (Create)

Module I: FUNCTIONAL AREAS & CLEANING AGENTS (8 hours)

Hotel Entrance, Lobby

Bell Desk

Reception Desk, Cashier

Concierge

Reservation

Telephone Operator

Housekeeping Control Desk

Linen Room, Uniform Room

Laundry

Florist Room

Layout of the areas

Module II: TARIFF (06 Hours)

Room tariff, Tariff fixation / calculating room tariff

Types of room tariff: Rack rate, discounted rates.

Meal Plan and its type

Forms & Format/ Tariff Card/Brochure

Module III: GUEST CYCLE (06 hours)

Pre-arrival, Arrival, Stay, Departure & Post Departure

Module IV: CLEANING AND CLEANING AGENTS USED IN HOTELS (10 Hours)

Principles of cleaning, hygiene, and safety factors in cleaning

Methods of organizing cleaning

Frequency of cleaning daily, periodic, special

Design features that simplify cleaning

Types of cleaning equipment

Types of cleaning agents

General Criteria for selection

Use, Care, and Storage

Distribution and Controls

Suggested Readings

(3 Credits: 45 hours) (L-T-P: 3-0-0)

Objective(s):

The objective of the course is to learn & demonstrate the use and maintenance of various cleaning agents & equipments and role play on various situations based on room divisions.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

CO 1: Understand the concept of marketing (Understand)

CO 2: Identify the consumer buying behavior (Knowledge)

CO 3: Analyze the market segmentation process (Analyze)

CO 4: Develop an understanding about marketing components (Create)

Module – I: Introduction to Marketing (07 hours)

Introduction

Market & Marketing

Marketing process

Concepts of marketing

Functions of marketing

Importance of marketing

Market orientations

Module – II: The Marketing Process (08 hours)

Introduction

4P's of marketing

Modern components of marketing mix (3P's)

Developing an effective marketing mix

Market planning

Market implementation and control

Module – III: Consumer Buying Behaviour (06 hours)

Introduction

Characteristics

Types of buying decision behaviour, Henry Assael Model, Consumer & buying decision and Process

Buyer decision process for new products

Buying motives & behaviour models

Module – IV: Business Buyer Behaviour (07 hours)

Introduction

Characteristics of business markets

Difference between consumer and business buyer behaviour

Buying situation in industrial / business market

Buying roles in industrial marketing
 Factors that influence business buyers
 Steps in business buying process

Module – V: Segmentation, Targeting & Positioning (08 hours)

Introduction
 Concepts of market segmentation
 Benefits of market segmentation
 Requisites of effective market segmentation
 Process of market segmentation
 Bases of segmenting consumer markets
 Targeting, Market positioning, Advertising and sales promotion
 Sales force management

VOCATIONAL TRAINING –I **

Note: If the student wants to discontinue the program of “B.sc in Hospitality & Hotel Administration” after 1st year of study, then the student have to undergo a vocational training to get the “certificate” in the same program.

HABV110I: BASIC VOCATIONAL TRAINING

(4 Credits – 120 hours) (L-T-P: 0-0-4)

Objective(s):

The objective of the course is to complete the training program of 2 months and prepare the training report which was learned during the training exposure and also completes the log book.

COURSE / LEARNING OUTCOMES:

At the end of this course student will be able to:

- CO 1: Understand and analysis to the practical experience and actual working environment for developing their skills and capabilities, as well as enhancing their intellectual and emotional persona. (Understand)
- CO 2: Identify & integrate classroom theory with workplace practice. (Knowledge)
- CO 3: Analyze& gain an understanding of administrative functions and company culture. (Analyze)
- CO 4: Develop skills to demonstrate various activities of all the core departments. (Create)

Module I - TRAINING EXPOSURE SUMMARY (50 hours)

The 08 weeks of vocational training would be from any two key areas of hospitality such as Food Production, Food and Beverage Service, Accommodation Operation, and Front Office Operations and student has to collect information's which will be needed to them during compiling of the training report.

Module 2 - TRAINING REPORT (40 hours)

During the training report the students has to complete the training report which will includes the details of the training organization, there USP, facilities of the various department
The outcome and experience they gain from the training

Module 3 - LOG BOOK (30 hours)

During the training the student has to duly sign the log book from the departmental authorities as a proof of their experience and learning skills from the specific department.

B.sc Hospitality & Hotel Administration (Honours)**HHRP401P: RESEARCH PROJECT PHASE I****(6 credits – 180 hours) (L-T-P: 0-0-12)**

The Research Project for the **B.Sc. Hospitality & Hotel Administration** program is an extended academic inquiry that enables students to analyse and interpret existing literature, identify gaps, and contribute innovative ideas relevant to the hospitality sector. **Phase I** requires students to prepare and present the Project Title, Review of Related Literature, Research Objectives, Research Questions or Hypotheses, and the Proposed Methodology, ensuring a clear conceptual foundation for the study. Assessment for this phase is based on a formal presentation followed by a Viva Voce examination, carrying a total of **100 marks**, and evaluates the student's clarity in defining the problem, depth of literature engagement, logical structuring of objectives and methodology, and overall ability to justify and defend the proposed research.

HHRP402P: RESEARCH PROJECT PHASE II**(6 credits – 180 hours) (L-T-P: 0-0-12)**

The Research Project for the **B.Sc. Hospitality & Hotel Administration** program is an extended academic study that guides students in analysing a research question through critical interpretation of existing literature and original inquiry. **Phase II** requires students to present the complete research work, including data analysis, interpretation of findings, conclusion, study limitations, and future research directions, demonstrating their ability to connect empirical results with theoretical frameworks in hospitality. The assessment for this phase consists of a comprehensive presentation followed by a Viva Voce examination, carrying **100 marks**,

evaluating the quality of analysis, clarity of interpretation, depth of critical thinking, and the student's ability to defend the overall research outcomes.

B.sc Hospitality & Hotel Administration (Honours) with Research

PCDI411P: DISSERTATION I

(18 Credits -540 Hours) (L-T-P: 0-0-36)

Every student enrolled in the B.Sc. Hospitality & Hotel Administration program shall undertake a research project under the supervision of an assigned faculty mentor. Students may select their research topic and begin preliminary groundwork by the end of the second semester. During Phase I, they are required to complete the Literature Review and present both the Literature Review and the Research Proposal. Students must also initiate data collection as per their approved methodology. The Phase I report must be submitted to the department within the notified deadline. The Department will publish the mode of evaluation, components, and weightages for Phase I and Phase II (Full Marks: 100 each) at the beginning of the semester. The assessment for the research project will include a PowerPoint presentation of the work followed by a Viva Voce examination.

PCDI412P: DISSERTATION II

(20 Credits -600 Hours) (L-T-P: 0-0-40)

Every student of the **B.Sc. Hospitality & Hotel Administration** program shall undertake a research project under the supervision of a designated faculty mentor. Students may select their research topic and are expected to begin preliminary work by the end of the **7th semester**. During **Phase I**, they must complete the Literature Review and present both the Literature Review and the Research Proposal, along with completing data collection within the same semester. **Phase II** of the dissertation is ideally carried out during the **8th semester**, culminating in the submission of the thesis to the department within the notified deadline. The Department will publish the evaluation structure, components, and weightages for **Phase I (100 marks)** and **Phase II (100 marks)** at the beginning of the semester. The final assessment will include a PowerPoint presentation of the research followed by a Viva Voce examination.

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

**PROGRAMME: BACHELOR OF TECHNOLOGY (BTECH) – ARTIFICIAL INTELLIGENCE AND
MACHINE LEARNING**

****Undergraduate Degree Course Structure Based on AICTE Model Curriculum 2024 (Subject to Change)****

Main emphasis should be on Project Based Learning / Experiential Learning.

There should be an option to delay internship semester to 7th/ 8th Semester as per institute convenience and availability of internship slots for different group of students.

SEMESTER-I

CSXXXXXX: English for Technical writing
(2 credits - 30 Hours)

Course Objective

The main aim of the course is to build competence in English grammar and vocabulary and to enhance effective communication by developing Reading, Writing, Listening, and Speaking skills of students.

Course Outcomes:

After completion of the course, students would be able to:

- CO 1. Understand various technical writing skills.
- CO 2. Apply the technical writing and communication skills in their academic and professional life.
- CO 3. Gain self-confidence with improved command over English.
- CO 4. Understand the technical aspects of communication for better performance in extra-curricular activities, recruitment processes, and prospective jobs.

Module 1: Fundamentals of Communication Skills

Scope and Significance of Communication Skills, Listening, Speaking, Reading, and Writing, Technical Communication, Tools of Effective Communication.

Module 2: Writing Skills

Basics of Grammar – Placing of Subject and Verb, Parts of Speech, Uses of Tenses, Active-Passive, Narration.

Module 3: Vocabulary Building and Writing

Word Formation & Synonyms, Antonyms, Words Often Confused, One-Word Substitutes, Idioms and Phrasal Verbs, Abbreviations of Scientific and Technical Words.

Module 4: Speaking Skills

Introduction to Phonetic Sounds & Articulation, Word Accent, Rhythm and Intonation, Interpersonal Communication, Oral Presentation, Body Language and Voice Modulation (Paralinguistics and Non-Verbal), Negotiation and Persuasion, Group Discussion, Interview Techniques (Telephonic and Video Conferencing).

Module 5: Technical Writing

Job Application, CV Writing, Business Letters, Memos, Minutes, Notices, Report Writing & Structure, E-mail Etiquette, Blog Writing.

Suggested Readings:

The Essence of Effective Communication, Ludlow R. and Panton F., Pubs: Prentice Hall, 1992.

Effective Communication Skills, Kulbhushan Kumar, Khanna Publishing House, 2019.

A University Grammar of English, Quirk R. and Sidney G., 3rd Edition, Pubs: Pearson Education, 2008.

High School English Grammar, Wren and Martin, Pubs: S. Chand & Company Ltd, 2007.

Essentials of Business Communication, Guffrey M.E., 8th Edition, Pubs: South-Western College Publishing, 2009.

Technical Communication: Principles and Practice, Raman M. and Sharma S., 2nd Edition, Pubs: Oxford University Press, 2012.

Effective Business Communication, Rodrigues M.V., Pubs: Concept Publishing Company, Delhi, 2003.

English Vocabulary in Use, McCarthy M. and Felicity O'Dell, 2nd Edition, Pubs: 2010.

**CSXXXXXX: Oral Communication Practice Lab
(1credit-15Hours)**

Laboratory/Practicals:

Introducing Oneself, Exercise on Parts of Speech & Exercise on Tense.

Exercise on Agreement, Narration, Active-Passive Voice & Dialogue Conversation.

Exercise on Writing Skills and Listening Comprehension (Audio CD).

Practice of Phonemes, Word Accent, Intonation, JAM Session.

Individual Presentation, Extempore, and Picture Interpretation.

Vocabulary Building Exercises (One-Word Substitute, Synonyms, Antonyms, Words Often Confused, etc.) & Group Discussion.

AlternativeNPTEL/SWAYAMCourse:

S.No.	NPTELCourseName	Instructor	HostInstitute
1.	Communication Skills-Video course	Dr.T. Ravichandran	IIT Kanpur
2.	Communication Skills	Dr. Zuchamo Yanthan	Indira Gandhi National Open University

**MAMT115T: Mathematics I
(4credits-60Hours)**

Course Objective:

To make the students well versed with the concepts of linear algebra. The students should also be able to solve calculus and vector calculus-based problems.

Course Outcomes:

After completion of course, students would be able to:

CO 1: Recall and analyse the idea of basic algebra. (Remembering and analysing)

CO 2: Understand and apply calculus and multivariate calculus. (Understanding and applying)

CO 3: Understand and apply vector calculus. (Understanding and applying)

CO 4: Understand and apply differential equations. (Understanding and applying)

Detailed Contents:**Module 1: Linear Algebra** (12 Hours)

Vector spaces, Subspaces, basis and dimension, linear transformations, representation of transformations by Matrices, linear functionals, transpose of linear transformations, canonical forms.

Module 2: Vector Calculus (8 Hours)

Applications. Integrals of Vector Functions: Line integrals, Green's formula, path independence, Surface integral: definition, evaluation, Stoke's formula, Gauss-Satoransky divergence theorem.

Module 3: Calculus & Multivariate Calculus (12 Hours)

Continuity and differentiability of a function of single variable, statement of Rolle's Theorem, Lagrange's mean value theorem and applications. Double and Triple Integrals: Calculations, Areas, Volumes, change of variables. Integral Calculus: Definite Integrals as a limit of sums, Applications of integration to area, volume, surface area, Improper integrals.

Module 4: Differential Equations (8 Hours)

Ordinary Differential Equations: First order linear equations, Bernoulli's equations, Exact equations and integrating factor, Second order and Higher order linear differential equations with constant coefficients

Alternative NPTEL/SWAYAM Course (if any):

NPTEL Course Name: Basic calculus for Engineers, Scientists and Economists

Instructor: Prof. Joydeep Dutta

Host Institute: IIT Kanpur

Text Books/Suggested References:

1. G. B. Thomas, R. L. Finney. Calculus and Analytic Geometry, Ninth Edition, Pearson Education, 2010
2. Reena Garg, Advanced Engineering Mathematics, Khanna Book Publishing Co., Delhi.

CO4		M		H

CSXXXXXX: Physics

(2credits-30Hours)

Course Objective:

This course will help the students to familiarize with Ultrasonics, SHM, Oscillations, Wave motion, diffraction, polarization, laser, fiber optics and holo graphy concepts.

Course outcomes: After completion of course, students would be able to:

CO 1. Understand the latest developments in certain areas of Physics which have important applications for societal needs.

CO 2. Understand lasers and fiber optics, which have important applications for societal needs.

CO 3. Understand the latest developments in certain areas of Physics which have important applications for societal needs.

CO 4. Develop the capability to tackle problems in general and in the various areas covered in the course.

Module1:Ultrasonics & SH

Production, Detection, and Uses of Ultrasonics, Reverberation, Sabine's Formula (no derivation), Review of Basic Kinematics (Displacement, Velocity, Acceleration, Time Period, and Phase of Vibration) and Dynamics (Restoring Force and Energetics) of Simple Harmonic Motion, Differential Equation of SHM, Superposition of Two SHM in One Dimension, Charge Oscillations in LC Circuits.

Module2:Oscillations

Damped Oscillations: Concept and cause of damping, differential equation of a damped oscillator and different kinds of damping, Methods of describing damping of an oscillator – logarithmic decrement, relaxation time, quality factor, band width. Series LCR circuit as a damped oscillator. Forced Oscillations: States of forced oscillations, differential equation of forced oscillator – its displacement, velocity and impedance, behavior of displacement and velocity with driver's frequency, Power, bandwidth, Quality factor and amplification of forced oscillator, resonance in forced oscillators, forced oscillations in series LCR circuit

Module3:WaveMotionandinterference

Wave equation and its solution, characteristic impedance of a string, reflection and transmission of waves on a string at a boundary, reflection and transmission of energy, the matching of impedances, Division of wave front and amplitude; Fresnel's bi prism, Newton's rings, Michelson interferometer and its applications for determination of λ and $d\lambda$.

Module4:Diffraction&Polarization

Fresnel and Fraunhofer diffraction, qualitative changes in diffraction pattern on moving from single slit to double slit, plane transmission grating, dispersive power & resolving power of a grating, Methods of polarization, analysis of polarized light, quarter and half wave plates, double refraction.

Module5: Lasers, Fiber Optics and Holography

Elementary Idea of LASER Production, Spontaneous Emission, Stimulated Emission, Einstein's Coefficients, Helium-Neon, Ruby, and Semiconductor Lasers, Applications of Lasers. Basics of Optical Fiber – Its Numerical Aperture, Coherent Bundle, Step Index and Graded Index Fiber, Material Dispersion, Fiber Optic Sensors, Applications of Optical Fiber in Communication Systems. Holography: Basic Principle, Theory, and Requirements.

Suggested Readings

Engineering Physics by A.B. Bhattacharya, Khanna Publishing House, 2020.

Physics for Engineers by N.K. Verma, Prentice Hall India, 2017.

Physics of Vibrations and Waves by H.J. Pain, 5th Edition, Wiley, 2006.

Optics by Ajoy Ghatak, McGraw Hill Education India, 2017.

CSXXXXXX: Physics Lab (1credit-15Hours)

Laboratory/Practicals:

To find the wavelength of sodium light using Fresnel's biprism.

To determine the wavelength of He-Ne laser using a transmission grating.

To determine the slit width using the diffraction pattern.

To determine the wavelength of sodium light by Newton's rings method.

To determine the wavelength of sodium light using a diffraction grating.
 To find the specific rotation of a sugar solution using a Bi-quartz Polarimeter.
 To design a hollow prism and use it to find the refractive index of a given liquid.

Alternative NPTEL/SWAYAM Course(if any):

S.No.	NPTEL Course Name	Instructor	HostInstitute
1.	Classical Physical	Prof.V.Balakrishnan	IIT Madras
2.	Modern Optics	Prof.ParthaRoyChaudhuri	IIT Kharagpur

MAAI116T: Mathematical Concepts for AI
(4credits-60Hours)
Course Objective:

This course should help the students understand the basic mathematical background of AI. Also, the students should be able to apply statistics and probability to analyse various datasets.

Course outcomes:

After completion of course, students would be able to:

CO 1: To understand the mathematical background of AI. (Understanding)

CO 2: Understand and apply calculus. (Understanding and applying)

CO 3: Relate the essential tool of matrices and algebra in a comprehensive manner. (Analysing)

CO 4: Apply the concept of probability and statistics in real life and apply hypothesis testing on different datasets. (Applying)

Detailed contents:**Module 1: Equations, Functions and Graphs (8 Hours)**

Introduction to linear equations, Intercepts and slopes, System of equations, Exponentials, radicals and logarithms, Polynomials, Polynomial operations, Factorizations, Introduction to quadratic equations, Functions

Module 2: Derivatives and Optimizations (8 Hours)

Rate of change, Introduction to limits, Continuity, finding limits, Differentiability, Derivative rules and operations, using derivatives to analyse functions, Second order derivatives, Optimization functions, Multivariate differentiation

Module 3: Vectors and Matrices (12 Hours)

Introduction to vectors, Vector addition, vector multiplication, Introduction to matrices, matrix multiplication, properties of matrices, types of matrices, Matrix division, solving system of equations with matrices, Matrix transformations, Eigen values and eigen vectors, rank of matrix; Echelon form, Normal form, Gauss-Jordan method, Gauss elimination method, Eigenvalues and eigenvectors.

Module 4: Probability and Statistics (12 Hours)

Basic rules and axioms events, sample space, dependent and independent events, conditional probability, Random variables- continuous and discrete, expectation, variance, distributions- joint and conditional, Bayes' Theorem, Popular distributions- binomial, Bernoulli, Poisson.

Alternative NPTEL/SWAYAM Course (if any):

NPTEL Course Name: Essential Mathematics for Machine Learning

Instructor: Prof. Sanjeev Kumar, Prof. S. K. Gupta

Host Institute: IIT Roorkee

Text Books/Suggested References:

1. Mathematics for Machine Learning, Marc Peter Deisenroth, A. Aldo Faisal, Cheng Soon Ong, Cambridge University Press., 2020
2. Advanced Engineering Mathematics, Reena Garg, Khanna Book Publishing Co., Delhi.
3. Machine Learning, Rajiv Chopra, Khanna Book Publishing Co., Delhi.
4. Introduction to Applied Linear Algebra: Vectors, Matrices, and Least Squares, Stephen Boyd, Lieven Vandenberghe, Cambridge University Press., 2018
5. Probability and statistics for Engineers and Scientists, Walpole, Myers, Myers and Ye, Pearson Education, 2012
6. Advanced Engineering Mathematics, Wylie and Barrett, McGraw Hill, 1995

CSXXXXXX: Chemistry
(3credits-45Hours)

Course Objective: The student with the knowledge of the basic chemistry, will understand and explain scientifically the various chemistry related problems in the industry/engineering field. The student will be able to understand the new developments and breakthroughs efficiently in engineering and technology. The introduction of the latest (R&D oriented) topics will make the engineering student upgraded with the new technologies.

Course Outcomes: The course will enable the students:

- CO 1.** To analyze microscopic chemistry in terms of atomic and molecular orbitals and inter-molecular forces.
- CO 2.** To rationalize bulk properties and processes using thermodynamic considerations.
- CO 3.** To distinguish the ranges of the electromagnetic spectrum used for exciting different molecular energy levels in various spectroscopic techniques.
- CO 4.** To rationalize periodic properties such as ionization potential, electro negativity, oxidation states, and electro negativity.
- CO 5.** To list major chemical reactions that are used in the synthesis of molecules.

ModuleI: Atomic and Molecular Structure

Schrodinger equation. Particle in a box solutions and their applications for conjugated molecules and nano particles. Forms of the hydrogen atom wave functions and the plots of these functions to explore their spatial variations. Molecular orbit also f di atomic molecules and plots of them

Multicentre Orbitals. Equations for atomic and molecular orbitals. Energy Level Diagrams of Diatomic Molecules. Pi-molecular orbitals of butadiene and benzene and aromaticity. Crystal Field Theory and the energy level diagrams for transition metal ions and their magnetic properties. Band Structure of Solids and the role of doping on band structures

ModuleII: Spectroscopic techniques and applications

Principles of Spectroscopy and Selection Rules. Electronic Spectroscopy. Fluorescence and Its Applications in Medicine. Vibrational and Rotational Spectroscopy of Diatomic Molecules. Applications. Nuclear Magnetic Resonance and Magnetic Resonance Imaging. Surface Characterization Techniques. Diffraction and Scattering.

ModuleIII: Inter molecular forces and potential energy surfaces

Ionic, Dipolar, and van der Waals Interactions. Equations of State of Real Gases and Critical Phenomena. Potential Energy Surfaces of H_3 , H_2F , and HCN and Trajectories on These Surfaces.

Module IV: Use of free energy in chemical equilibria (6 lectures)

Thermodynamic functions: energy, entropy, and free energy. Estimations of entropy and free energies. Free energy and electromotive force (emf). Cell potentials, the Nernst equation, and applications. Acid-base, oxidation-reduction, and solubility equilibria. Water chemistry. Corrosion. Use of free energy considerations in metallurgy through Ellingham diagrams.

ModuleV: Periodic properties

Effective nuclear charge, penetration of orbitals, variations of s, p, d and f orbital energies of atoms in the periodic table, electronic configurations, atomic and ionic sizes, ionization energies, electron affinity and electro negativity, polarizability, oxidation states, coordination numbers and geometries, hard soft acids and bases, molecular geometries.

Module VI: Stereochemistry

Representations of 3 dimensional structures, structural isomers and stereoisomers, configurations and symmetry and chirality, enantiomers, diastereomers, optical activity, absolute configurations and conformational analysis. Isomerism in transitional metal compounds.

Module VII: Organic reactions and synthesis of a drug molecule

Introduction to reactions involving substitution, addition, elimination, oxidation, reduction, cyclization and ring openings. Synthesis of a commonly used drug molecule.

Suggested Readings

University chemistry, by B. H. Mahan

Chemistry: Principles and Applications, by M. J. Sienko and R. A. Plane

Fundamentals of Molecular Spectroscopy, by C. N. Banwell

Engineering Chemistry (NPTEL Web-book), by B. L. Tembe, Kamaluddin and M. S. Krishnan

Physical Chemistry, by P. W. Atkins

Organic Chemistry: Structure and Function by K. P. C. Vollhardt and N. E. Schore, 5th Edition <http://bcs.whfreeman.com/vollhardtschore5e/default.asp>.

Alternative NPTEL/SWAYAM Course:

S.No.	NPTEL Course Name	Instructor	Host Institute
1	CHEMISTRY-I	PROF.MANGALASUNDER KRISHNAN	IITM

CSXXXXXX: Chemistry Lab
(1credit-15Hours)

Laboratory Outcomes: The chemistry laboratory course will consist of experiments illustrating the principles of chemistry relevant to the study of science and engineering. The students will learn:

- CO 1.** To estimate rate constants of reactions from concentration of reactants/products as a function of time.
CO 2. To measure molecular/system properties such as surface tension, viscosity, conductance of solutions, redox potentials, chloride content of water, etc.
CO 3. To synthesize a small drug molecule and analyze a salt sample.

Laboratory/Practicals:

Choice of 10-12 experiments from the following:

Determination of Surface Tension and Viscosity.
 Thin Layer Chromatography.
 Ion Exchange Column for Removal of Hardness of Water.
 Determination of Chloride Content of Water.
 Colligative Properties Using Freezing Point Depression.
 Determination of the Rate Constant of a Reaction.
 Determination of Cell Constant and Conductance of Solutions.
 Potentiometry - Determination of Redox Potentials and EMFs.
 Synthesis of a Polymer/Drug.
 Saponification/Acid Value of an Oil.
 Chemical Analysis of a Salt.
 Lattice Structures and Packing of Spheres.
 Models of Potential Energy Surfaces.
 Chemical Oscillations - Iodine Clock Reaction.
 Determination of the Partition Coefficient of a Substance Between Two Immiscible Liquids.
 Adsorption of Acetic Acid by Charcoal.
 Use of the Capillary Viscometer to Demonstrate the Isoelectric Point as the pH of Minimum Viscosity for Gelatin Sols and/or Coagulation of the White Part of Egg.

CSxxxxxx: PROGRAMMING FOR PROBLEM SOLVING**(3 credits-45 Hours)****Course Objectives****Course Outcomes**

Define and describe various terms and concepts of C programming language (Remembering)
 Compare and interpret information based on their understanding of the concepts of C language syntax, data types, control statements, functions, pointers, arrays, structures, files, graphics and hardware programming using C. (Understanding)
 Solve problems using standard algorithms and translate pseudo-codes into C programs and implement them. (Applying)
 Analyze their skills for choosing the right data structure, function, data types and develop logic to solve various instances of problems. (Analyze)
 Combine the various concepts and ideas learnt in C to plan, propose and develop a product. (Creating)
 Evaluate various algorithms used for searching, sorting etc., in terms of correctness and computation cost. (Evaluate)

Module I (8 Hours)

Introduction to Programming, Introduction to components of a computer system (disks, memory, processor, where a program is stored and executed, operating system, compilers etc.), and Idea of Algorithm: steps to solve logical and numerical problems. Types of Algorithm: Sequentially executed, Conditional Based, repetitive structure, Representation of Algorithm: Flowchart/Pseudo code with examples, from algorithms to programs; source code, variables (with data types) variables and memory, locations, Syntax and Logical Errors in compilation, object and executable code.

Module II (12 Hours)

Operators, precedence of operators, Arithmetic expressions, Conditional Branching and Loops, Writing and evaluation of conditionals and consequent branching, Iteration and loops.

Module III (5 Hours)

Arrays, Arrays (1-D, 2-D), Character arrays and Strings

Module IV (5 Hours)

Basic Algorithm Searching, Basic Sorting Algorithms (Bubble, Insertion and Selection), Finding roots of equations, notion of order of complexity through example programs (no formal definition required)

Module V (8 Hours)

Functions (including built in libraries), Parameter passing in functions, call by value, passing arrays to functions: idea of call by reference, Recursion.

Module VI (7 Hours)

Structures, Defining structures and Array of Structures, Idea of pointers, Defining pointers, Use of Pointers in self-referential structures, notion of linked list (no implementation), File handling.

Suggested Readings

CSxxx: PROGRAMMING FOR PROBLEM SOLVING LAB
(2 credits)

Course Outcomes

Relate the programming logic (Remembering)

Illustrate the theoretical concepts learnt in C programming language. (Understanding)

Apply existing algorithms in writing programs using C language and also do graphics programming. (Applying)

Analyze their skills for choosing the right data structure, functions, data types and develop logic to write programs in C. (Analyzing)

Evaluate the sorting and searching algorithms through implementation in terms of correctness and computation cost. (Evaluating)

Combine the various concepts and ideas learnt in C to plan, propose and develop a product. (Creating)

CSXXXXXX: Design Thinking
(1 credit-15Hours)

Course Objective:

The objective of this Course is to provide the new ways of creative thinking and Learn the innovation cycle of Design Thinking process for developing innovative products which useful for a student in preparing for an engineering career.

Course Outcomes: After completion of course, students would be able to:

Compare and classify the various learning styles and memory techniques and Apply them in their engineering education

Analyze emotional experience and Inspect emotional expressions to better understand users while designing innovative products

Develop new ways of creative thinking and Learn the innovation cycle of Design Thinking process for developing innovative products

Propose real-time innovative engineering product designs and Choose appropriate frameworks, strategies, techniques during prototype development

Perceive individual differences and its impact on every day decisions and further Create a better customer experience

Unit 1: An Insight to Learning

Understanding the Learning Process, Kolb's Learning Styles, Assessing and Interpreting

Unit 2: Remembering Memory

Understanding the Memory process, Problems in retention, Memory enhancement techniques

Unit 3: Emotions: Experience & Expression

Understanding Emotions: Experience & Expression, Assessing Empathy, Application with Peers

Unit 4: Basics of Design Thinking

Definition of Design Thinking, Need for Design Thinking, Objective of Design Thinking, Concepts & Brainstorming, Stages of Design Thinking Process (explain with examples) – **Empathize, Define, Ideate, Prototype, Test**

Unit 5: Being Ingenious & Fixing Problem

Understanding Creative thinking process, Understanding Problem Solving, Testing Creative Problem Solving

Unit 6: Process of Product Design

Process of Engineering Product Design, Design Thinking Approach, Stages of Product Design, Examples of best product designs and functions, **Assignment–Engineering Product Design**

Unit 7: Prototyping & Testing

What is Prototype? Why Prototype? Rapid Prototype Development process, Testing, **Sample Example**, Test Group Marketing

Unit 8: Celebrating the Difference

Understanding Individual differences & Uniqueness, Group Discussion and Activities to encourage the understanding, acceptance and appreciation of Individual differences

Unit 9: Design Thinking & Customer Centricity

Practical Examples of Customer Challenges, Use of Design Thinking to Enhance Customer Experience, Parameters of Product experience, Alignment of Customer Expectations with Product Design

Unit 10: Feedback, Re-Design & Re-Creat

Feedback loop, Focus on User Experience, Address “ergonomic challenges, User focused design, rapid prototyping & testing, final product, Final Presentation – **“Solving Practical Engineering Problem through Innovative Product Design & Creative Solution”**.

CSXXXXXX: Universal Human Values I: Student Induction Program

SEMESTER-II

**CSXXXXXX: Mathematics II
(4 credits-60 Hours)**

Course Objective:

To make the students understand the behaviour of various series. They should also be able to calculate probabilities and statistics of different datasets.

Course Outcomes: After completion of course, students would be able to:

Understand the behavior of series and their applications.

Understand number system and its applications.

Understand the concept of probability and apply in real life.

Understand and apply the concept of statistics.

Module 1: Sequences and Series

Limit of a sequence, monotone and Cauchy sequences and properties of convergent sequences, examples. Infinite series, positive series, tests for convergence and divergence, integral test, alternating series, Leibniz test.

Module 2: Functional Series

Pointwise and uniform convergence, basic aspects of Power series, Fourier series

Module 3: Math Foundation

Statements, Quantifiers, Operation on sets and functions, Relations, Proofs.

Module 4: Number System

Countability of algebraic numbers, Transcendental numbers and construction of Liouville's number, Equivalence classes, construction of real numbers (using Cauchy sequences), Fermat's little theorem and using it for Miller-Rabin primality test, Wilson's theorem and Primitive root theorem.

Module 5: Probability

Sample space and events, definitions of probability, properties of probability, conditional probability. Random variables: distribution functions, discrete and continuous random variables, moments of random variables, conditional expectation, Chebyshev inequality, functions of random variables. Special Distributions: Bernoulli, Binomial, Geometric, Pascal, Poisson, Exponential, Uniform, Normal distributions, Limit Theorems: Law of large numbers

1.	Engineering Mathematics-I	Prof. Jiten-dra Kumar	IIT Kharagpur
2.	Probability and Statistics	Prof. Somesh-Kumar	IIT Kharagpur

CSXXXXXX: Object Oriented Programming

(3 credits-45 Hours)

Objective:

The course aims to introduce students to the foundational concepts of programming using Python. It equips learners with the skills to write clean, modular, and efficient Python code for problem-solving. The course emphasizes the use of built-in data types, control structures, functions, and file handling. It then transitions into object-oriented programming concepts such as classes, objects, inheritance, and polymorphism. Students will also develop the ability to debug, test, and apply object-oriented design principles.

Course outcomes:

After completion of course, students would be able to:

CO1: Recall fundamental Python syntax, data types, and programming constructs used in basic script development.

CO2: Explain the working of conditional statements, loops, functions, and object-oriented concepts like inheritance and polymorphism.

CO3: Use Python to implement solutions for simple real-life problems involving control structures, data handling, and class-based design.

CO4: Analyze problems to decide when and how to apply OOP principles effectively including the selection of appropriate Python features for given problems.

CO5: Design and develop Python applications using classes, inheritance, and polymorphism to solve moderately complex problems.

Module I: Python Basics

Introduction to Python Programming; Python vs. C: memory management, dynamic typing; Python syntax and indentation; Data types: numbers, strings, booleans; Variables and input/output; Operators and expressions; Type casting and basic error handling

Module II: Control Flow and Data Structures

Conditional statements; Loops; Lists and tuples; Sets and dictionaries; List comprehensions; Iterating through sequences; Arrays; User-defined datatypes

Module III: Functions and Modules

Defining and calling functions; Parameters and return values; Namespace, Scope and lifetime of variables; Built-in functions; Creating and importing modules; Advanced function concepts (lambda, map/ filter/ reduce); Recursion basics

Module IV: Object-Oriented Programming

Introduction to various programming paradigms; Advantages of OOP; Comparison of OOP with Procedural Paradigm; Aggregation and Composition; Introduction to classes and objects; Attributes and methods; Constructors; The self keyword; Special methods (__init__, __str__, etc.); Class variables vs. instance variables; Method types: instance, class, static methods; Operator overloading

Module V: OOP Concepts & Advanced Features

Inheritance (single, multiple, multilevel); Base classes and Derived classes; Composition vs. Inheritance; Invocation of Constructors and Destructors in Inheritance; Method overriding and polymorphism; Iterators and generators as objects; Encapsulation and abstraction; Metaclass/abstract classes; Exception handling; File I/O; Regular expressions; Introduction to unit testing

Alternative NPTEL/SWAYAM Course:

Sl. No.	Course Name	Instructor	Host Institute
1	Problem solving Aspects and Python Programming	Dr.S.Malliga, Dr.R.Thangarajan, Dr.S.V.Kogilavani	Kongu Engineering College
2	Python For Data Science	Prof. Raghunathan Rengasamy	IIT Madras
3	The Joy of Computing Using Python	Prof. Sudarshan Gupta Prof.Yayati lyengar	IIT Ropar, IIIT Dharwad

CSXXXXXX: Object Oriented Programming Lab (1credit-15Hours)

Laboratory/ Practicals:

Write a program that asks the user for their name and greets them with their name.

Write a program that asks the user for a number n and gives them the possibility to choose between computing the sum and computing the product of 1,...,n.

Write a function that checks whether an element occurs in a list.

Write three functions that compute the sum of the numbers in a list: using a for-loop, a while-loop and recursion.

Given two strings, write a program that efficiently finds the longest common subsequence.

Implement a Time class with members variables for hours, minutes, and seconds. Implement the init method to initialize these variables for an object.

Implement overloaded add functions to add two Time objects.

Write programs to demonstrate inheritance.
Write programs to demonstrate polymorphism.
Write programs to demonstrate exception handling.

CSXXXXXX: Data Structures (3credits-45Hours)

CourseObjective:

The student should be able to describe and implement various data structures including lists, arrays, stacks, queues, binary search trees, graphs, hash tables, and matrices. The student will be able to analyze and apply various algorithms for shortest path calculation, sorting and searching applications.

CourseOutcomes: After completion of course, students would be able to:

Understand the different types of data structure to be implemented using any programming language.
Choose the data structures that effectively model the information in a problem and analyze the efficiency trade-offs (run time and memory usage) among alternative data structure implementations or combinations.

Design, implement, test, and debug programs using a variety of data structures including stacks, queues, hash tables, binary and general tree structures, search trees, and graphs.

Apply efficient data structure (linked lists, stacks and queues) to solve a particular problem.

Module 1: Introduction and Elementary Data Structures

Introduction: Introduction to Data Structures and data types, Efficient use of memory, Recursion, time and space complexity of algorithms, Big O Notation and theta notations.

Elementary Data Structures: Stacks, queues, Infix, Postfix & Prefix conversions, evaluations of expressions, multiple stacks and queues, priority queues as heaps, double ended queue, implementation of stacks and queues

Module 2: Linked Lists

Singly linked lists, linked stacks and queues, polynomial addition, sparse matrices, doubly linked lists and dynamic storage management, circular linked list, Applications of Stacks, Queues and Linked lists, Garbage collection, Josephus Problem

Module 3: Trees

Basic terminology, binary trees, binary tree traversal, representations of binary tree, application of trees, decision tree, game trees, Threaded Trees, Binary Search Tree, AVL tree, B-tree

Module 4: Graph Theory

Graph representations, Graph Traversals, Dijkstra's algorithm for shortest path, Prim's and Kruskal's Algorithm for Minimal Spanning tree

Module 5: Sorting and Searching

Searching: Linear search, binary search and hash search. Sorting: Insertion sort, selection sort, bubble sort, quick sort, merge sort, heap sort, and Bucket sort

Suggested Readings

1.	Data Structures and Algorithms- Videocourse	Prof. Naveen Garg	IIT Delhi
2.	Data Structures	Dr. S. Sasikala	University of Madras

CSXXXXXX: Data Structures Lab (1 credit-15 Hours)

Laboratory/Practicals:

Implement infix to postfix conversion using Stack

Write a program for swapping nodes in a linked list without swapping data.

Write a program to reverse a Linked List of given size.

Write a program for finding the first circular tour that visits all petrol pumps.

Implement Inorder tree traversal without recursion.

Write a program to check whether a given graph is Bipartite or not.

CSXXXXXX: Discrete Mathematical Structures (4 credits-60 Hours)

Course Objective:

Students should be able to understand Discrete Mathematical Structures (DMS) for the development of theoretical computer science, problem solving in programming language using Discrete Structure and importance of discrete structures towards simulation of a problem in computer science and engineering.

Course Outcomes:

After completion of course, students would be able to:

Understand the basics of various discrete structures.

Apply applications of discrete structures in Computer Science and Engineering.

Module 1: Mathematical Reasoning

Mathematical reasoning, Propositions, Negation, disjunction and conjunction, Implication and Equivalence, Truth tables, Predicates, Quantifiers, Natural deduction, Rules of Inference, Methods of proofs, Resolution principle, Application to PROLOG.

Module 2: Set Theory

Paradoxes in set theory, Inductive definition of sets and proof by induction, Peano postulates, Relations, Properties of relations, Equivalence Relations and partitions, Partial orderings, Posets, Linear- and well-ordered sets.

Module 3: Combinatorics and Functions

Elementary Combinatorics, counting techniques, Recurrence relation, Generating functions, Functions; mappings, Injection and Surjections, Composition of functions, Inverse functions, Special functions, Pigeonhole principle, Recursive function theory.

Module 4: Graph Theory

Elements of graph theory, Euler graph, Hamiltonian path, trees, Tree traversals, Spanning trees, Representation of relations by graphs.

Module 5: Groups, Rings, Fields, Discrete Probability

Definition and elementary properties of groups, Semigroups, Monoids, Rings, Fields, Vector spaces and lattices, Introduction, Discrete random variables, Application to Binary Search Tree.

Suggested Readings

CSXXXXXX: Modern Computer Architecture
(3 credits-45 Hours)
Course Objective:

Students should be able to understand basic principles of Computer Systems. They should be able to understand various logic design techniques and their applications. They should be capable of using high performance computing architecture.

Course Outcomes: After completion of course, students would be able to:

Understand the organization of the Control unit, Arithmetic and Logical unit, Memory unit and the I/O unit.
Analyse different computer architectures and their applications.
Understand modern design structures of Pipelined and Multiprocessor systems.
Understand distributed computing architecture and high-performance computing.

Module 1: Basics

Designing combinational and sequential logic, computer registers and instructions, timing, and control, instructions cycle, memory reference instruction, I/O interruption, Adder and Subtractor circuits, Booth Multiplication Algorithm, Pipelining Review, control hazards and the motivation for caches, cache characteristics and basic superscalar architecture basics,

Module 2: Multi-core Architecture

Memory technologies, hierarchical memory systems, the locality principle and caching, direct-mapped caches, block size, cache conflicts, associative caches, write strategies, advanced optimisations, performance improvement techniques, DRAM – organisation, access techniques, scheduling algorithms and signal systems. Tiled Chip Multicore Processors (TCMP), Network on Chips (NoC), NoC router – architecture, design, routing algorithms and flow control techniques, Advanced topics in NoC and storage – compression, prefetching, QoS.

Module 3: Distributed Computing Systems and Concurrency

Relation to Parallel Multiprocessors/multicomputer Systems, Distributed and Concurrent Programs, Message Passing vs. Shared Memory Systems, Synchronous vs. Asynchronous Executions, Design Issues and Challenges, Distributed Computing Technologies, Clocks and Synchronization, Coordination and Agreement Algorithms, Global State and Distributed Transactions.

Module 4: High Performance Computing (HPC)

HPC Architecture, Parallel Processing, Parallel Memory Models, Data vs. Task Parallelism, High Throughput Computing, Vectorization, Multithreading.

Module 5: High Performance Computing with CUDA

CUDA programming model, Basic principles of CUDA programming, Concepts of threads and blocks, GPU and CPU data exchange

Alternative NPTEL/SWAYAM Course(ifany):**CSXXXXXX:Universal Human Values-II: Understanding Harmony and Ethical Human Conduct
(3 credits-45Hours)****CourseObjective:**

The objective of this Course is to provide the new ways of creative thinking and Learn theinnovation cycle of Design Thinking process for developing innovative products which usefulfora student in pre-paringforan engineeringcareer.

CourseOutcomes:

By the end of the course, students are expected to become more aware of themselves, and their surroundings (family, society, nature); they would become more responsible in life, and in handling problems with sustainable solutions, while keeping human relationships and human nature in mind.

They would have better critical ability. They would also become sensitive to their commitment towards what they have understood (human values, human relationship and human society). It is hoped that they would be able to apply what they have learnt to their own self in different day-to-day settings in real life, at least a beginning would be made in this direction.

Therefore, the course and further follow up is expected to positively impact common graduate attributes like:

Holistic vision of life

Socially responsible behaviour

Environmentally responsible work

Ethical human conduct

Having Competence and Capabilities for Maintaining Health and Hygiene

Appreciation and aspiration for excellence(merit) and gratitude for all

Module 1 – Introduction to Value Education (6 lectures and 3 tutorials for practicesession)

Lecture 1: Right Understanding, Relationship and Physical Facility (Holistic Development and the Role of Education)

Lecture2: Understanding Value Education

Tutorial1:Practice Session PS1 Sharing about Oneself

Lecture3:Self-exploration as theProcess for Value Education

Lecture4:Continuous Happiness and Prosperity–theBasic Human Aspirations

Tutorial2:PracticeSession PS2 Exploring Human Consciousness

Lecture5:Happiness and Prosperity–Current Scenario

Lecture 6: Method to Fulfill the Basic Human Aspirations

Tutorial3:PracticeSessionPS3Exploring Natural Acceptance

Module2–Harmony in theHuman Being(6lecturesand3tutorialsforpracticesession)

Lecture7:Understanding Human being as the Co-existence of theSelf and the Body

Lecture 8: Distinguishing between the Needs of the Self and the Body

Tutorial 4: Practice Session PS4 Exploring the difference of Needs of Self and Body

Lecture 9: The Body as an Instrument of the Self

Lecture 10: Understanding Harmony in the Self

Tutorial 5: Practice Session PS5 Exploring Sources of Imagination in the Self

Lecture 11: Harmony of the Self with the Body

Lecture 12: Program to ensure self-regulation and Health

Tutorial 6: Practice Session PS6 Exploring Harmony of Self with the Body

Module 3 – Harmony in the Family and Society (6 lectures and 3 tutorials for practice session)

Lecture 13: Harmony in the Family – the Basic Unit of Human Interaction

Lecture 14: 'Trust' – the Foundational Value in Relationship

Tutorial 7: Practice Session PS7 Exploring the Feeling of Trust

Lecture 15: 'Respect' – as the Right Evaluation

Tutorial 8: Practice Session PS8 Exploring the Feeling of Respect

Lecture 16: Other Feelings, Justice in Human-to-Human Relationship

Lecture 17: Understanding Harmony in the Society

Lecture 18: Vision for the Universal Human Order

Tutorial 9: Practice Session PS9 Exploring Systems to fulfil Human Goal

Module 4 – Harmony in the Nature/Existence (4 lectures and 2 tutorials for practice session)

Lecture 19: Understanding Harmony in the Nature

Lecture 20: Interconnectedness, self-regulation and Mutual Fulfilment among the Four Orders of Nature

Tutorial 10: Practice Session PS10 Exploring the Four Orders of Nature

Lecture 21: Realizing Existence as Co-existence at All Levels

Lecture 22: The Holistic Perception of Harmony in Existence

Tutorial 11: Practice Session PS11 Exploring Co-existence in Existence

Module 5 – Implications of the Holistic Understanding – a Look at Professional Ethics (6 lectures and 3 tutorials for practice session)

Lecture 23: Natural Acceptance of Human Values

Lecture 24: Definitiveness of (Ethical) Human Conduct

Tutorial 12: Practice Session PS12 Exploring Ethical Human Conduct

Lecture 25: A Basis for Humanistic Education, Humanistic Constitution and Universal Human Order

Lecture 26: Competence in Professional Ethics

Tutorial 13: Practice Session PS13 Exploring Humanistic Models in Education

Lecture 27: Holistic Technologies, Production Systems and Management Models – Typical Case Studies

Lecture 28: Strategies for Transition towards Value-based Life and Profession

Tutorial 14: Practice Session PS14 Exploring Steps of Transition towards Universal Human Order

In order to connect the content of the proposals with practice (living), 14 practice sessions have been designed. The full set of practice sessions is available in the Teacher's Manual as well as the website.

Practice Sessions for Module 1 – Introduction to Value Education

PS1 Sharing about Oneself

PS2 Exploring Human Consciousness

PS3 Exploring Natural Acceptance

Practice Sessions for Module 2 – Harmony in the Human Being

PS4 Exploring the difference of Needs of Self and Body
PS5 Exploring Sources of Imagination in the Self
PS6 Exploring Harmony of Self with the Body

Practice Sessions for Module 3 – Harmony in the Family and Society

PS7 Exploring the Feeling of Trust
PS8 Exploring the Feeling of Respect
PS9 Exploring Systems to fulfil Human Goal

Practice Sessions for Module 4 – Harmony in the Nature (Existence)

PS10 Exploring the Four Orders of Nature
PS11 Exploring Co-existence in Existence

Practice Sessions for Module 5 – Implications of the Holistic Understanding – a Look at Professional Ethics

PS12 Exploring Ethical Human Conduct
PS13 Exploring Humanistic Models in Education
PS14 Exploring Steps of Transition towards Universal Human Order

SEMESTER–III

CSXXXXXX: Algorithm Analysis and Design (3 credits-45 Hours)

Course Objective:

The students should be able to analyze various algorithms mainly for time and space complexity. They should be able to develop algorithm for solving various computational problems by applying various

algorithm design strategies. They should be able to understand the effect of choice of data structures on the complexity of algorithm.

Course Outcomes:

After completion of course, students would be able to:

Apply the best data structure for designing an algorithm to solve a given problem.

Evaluate different algorithms with respect to time and space complexity.

Create algorithms to solve various computational problems.

Understand different complexity classes.

Module1: Basic Concepts of Algorithms

Notion of Algorithm, Fundamentals of Algorithmic Solving, Important problem types, Fundamentals of the Analysis Framework, Asymptotic Notations and Basic Efficiency Classes, Mathematical analysis of non-recursive algorithms. Mathematical analysis of recursive algorithm: recurrence relations, solution of recurrence relations using substitution method

Module2: Brute Force, Divide and Conquer Strategy

Selection sort, Bubble sort, Sequential searching (Linear Search), Brute force string matching, General method, Mergesort, Quick Sort, Binary Search, Strassen's matrix multiplication

Module3: Greedy Approach and Dynamic Programming

Fractional Knapsack problem, Minimum cost spanning tree: Prim's and Kruskal's algorithm, Single source shortest path problem, Principle of optimality, Multi-stage graph problem, all pair shortest path problem, 0/1 Knapsack problem, Traveling salesperson problem

Module4: Backtracking and Branch and Bound

General method backtracking, N-Queen problem, 0/1 Knapsack problem, General method of branch & bound, 0/1 Knapsack problem, Traveling sales person problem

Module 5: Lower Bound Theory and Complexity Classes

Lower bounds, Decision trees, P, NP and NP Complete problems

Suggested Readings

Algorithm Design, Jon Kleinberg and Eva Tardos, 1st Edition, Pearson Education 2014.

Design & Analysis of Algorithms, Gajendra Sharma, Khanna Book Publishing 2018.

Fundamentals of algorithms, Horowitz E, Sahni S, Rajasekaran S., University Press 2008.

Introduction to algorithms, Cormen, Leiserson, Rivest, Stein, 3rd Edition, PHI. 2012

An introduction to analysis of algorithms, R. Sedgewick, 1st edition, Pearson Education 1996.

Data Structures and Program Design in C By Robert L. Kruse, C.L. Tondo, Bruce Leung, Pearson Education. 2007.

Alternative NPTEL/SWAYAM Course (if any):

S.No.	Course Name	Instructor	Host Institute
1.	Design and analysis of algorithms	Prof. Madhavan Mukund	Chennai Mathematical Institute
2.	Design and analysis of algorithms	Prof. Abhiram Ranade	IIT Bombay

CSXXXXXX:Algorithm Analysis and Design Lab
(1credit-15Hours)

Laboratory/Practicals:

Write a program to implement different sorting techniques.
Write a program to find minimum cost spanning tree.
Write a program to implement travelling salesperson problem.
Write a program to find Longest Path in a Directed Acyclic Graph.
Write a program for Shortest path with exactly k edges in a directed and weighted graph.
Write a program to find maximum number of edge disjoint paths between two vertices

CSXXXXXX:Database Systems
(3credits-45Hours)

Course Objective:

Students should be able to understand various basics of DBMS and query languages. They should learn different types of database systems and their applications in different scenarios.

Course Outcomes:

After completion of course, students would be able to:

Understand the basics of databases and data management.

Understand various theoretical and practical principles involved in the design and use of database systems with the help of database

Design and implement databases for various scenarios.

Design a database scenario for handling big data.

Module 1: Introduction

Characteristics and fundamental concepts of Databases, Types of Data Models and Data Modelling, Elements of Database Systems, Classification and comparison of Database Management Systems (Relational and NoSQL), concurrency control, Lock based concurrency control, Time stamping methods.

Module 2: Structured and semi-structured data management

Structured data, relational databases, Relational model, Functional Dependencies, normal forms, algorithms for query optimization, Semi-structured data, document-databases, semi-structured data abstraction, representation, and search.

Module 3: Transaction Management

Transaction concept, transaction state, ACID properties, serializability, Recoverability, Implementation of isolation, Testing for serializability.

Module 4: Unstructured Data Management

Unstructured text, Information retrieval systems, document retrieval and ranking.

Module 5: Big Data Management

Platforms for Big Data, algorithms for Map-Reduce & Hadoop, Platforms for Big Graphs, algorithms for large graphs.

Alternative NPTEL/SWAYAM Course(if any):

S.No.	NPTEL Course Name	Instructor	Host Institute
1.	Data Base Management System	Prof. Partha Pratim Das, Prof. Samiran Chattopadhyay	IIT Kharagpur
2.	Introduction To Database Systems	Prof. Sreenivasa Kumar	IIT Madras

CSXXXXXX: Database Systems Lab
(1 credit-15 Hours)

Laboratory/Practicals:

Implement normal forms in a database.
 Implement basic SQL commands on a database.
 Implement information and ranking using any language.
 Implement document retrieval and ranking using any algorithm.
 Implement Map-reduce algorithm on any big data task.

CSXXXXXX: Computer Networks
(3 credits-45 Hours)

Course Objective:

Students should be able to have an understanding of the fundamental concepts of computer networking and have a basic knowledge of the various network models and their uses. They should be able to analyse, implement protocols and independently study literature concerning computer networks.

Course Outcomes: After completion of course, students would be able to:

Understand basic computer network technology.
 Understand the different types of network topologies and protocols.
 Analyse the different types of network devices and their functions within a network.
 Analyse the architecture and principles of today's computer networks.
 Understand the requirements for the future Internet and its impact on the computer network architecture.

Module1: Computer Networks and The Internet

What is the Internet; network edge; network core; Delay, Loss and throughput in Packet-Switched Networks; Protocol Layers and their Service Models.

Module2: Application Layer

Principles of Network Applications; The Web and HTTP; File Transfer: FTP; Electronic Mail in the Internet; DNS - The Internet's Directory Service; Peer-to-Peer applications; Socket Programming – Creating network applications.

Module3: Transport Layer

Introduction and Transport-Layer Services; Multiplexing and Demultiplexing; Connectionless Transport: UDP; Principles of Reliable of Data Transfer; Connection-Oriented Transport: TCP; Principles of Congestion Control, TCP Congestion Control.

Module 4: Network Layer

Introduction; Virtual circuit and datagram networks; What is inside a router; Internet Protocol (IP): Forwarding and Addressing in the Internet; Routing Algorithms; Routing in the Internet; Broadcast and Multicast Routing.

Module 5: Data Link Layer

Introduction to the link layer; Error Detection and Correction Techniques; Multiple Access Links and Protocols; Switched local area networks.

Alternative NPTEL/SWAYAM Course (if any):

S.No.	Course Name	Instructor	Host Institute
1.	Computer Networks-Video course	Prof. Sujoy Ghosh	IIT Kharagpur
2.	Computer Networks and Internet Protocol	Prof. Soumya Kanti Ghosh, Prof. Sandip Chakraborty	IIT Kharagpur,

CSXXXXXX: Computer Networks Lab (1 credit-15 Hours)

Laboratory/Practicals:

Write a program for using TCP and UDP Sockets.
Write a simulation of sliding window protocols.
Write a simulation of Routing Protocols.
Configure given network topologies using any network simulator software.
Write programs for error detecting codes.
Write a program for Client Server Communication.

CSXXXXXX: Introduction to Machine Learning
(3 credits-45 Hours)

Course Objective:

The students will understand the basics of Machine Learning. They will also learn and will be able to apply different machine learning models to various datasets.

Course Outcomes:

After completion of course, students would be able to:

CO 1: Understand basic applications and issues of Machine Learning.

CO 2: Understand the different types of datasets.

CO 3: Analyze and work with different datasets.

CO 4: Analyze various Machine Learning techniques and algorithms.

CO 5: Apply various algorithms to different datasets.

Module 1: Introduction

What Is Machine Learning?, How Do We Define Learning?, How Do We Evaluate Our Networks?, How Do We Learn Our Network?, What are datasets and how to handle them?, Feature sets, Dataset division: test, train and validation sets, cross validation.

Module 2: Basics of machine learning

Applications of Machine Learning, processes involved in Machine Learning, Introduction to Machine Learning Techniques: Supervised Learning, Unsupervised Learning and Reinforcement Learning, Real life examples of Machine Learning.

Module 3: Supervised learning

Classification and Regression: K-Nearest Neighbor, Linear Regression, Logistic Regression, Support Vector Machine (SVM), Evaluation Measures: SSE, MME, R², confusion matrix, precision, recall, F-Score, ROC-Curve.

Module 4: Unsupervised learning

Introduction to clustering, Types of Clustering: Hierarchical, Agglomerative Clustering and Divisive clustering; Partitional Clustering-K-means clustering.

Module 5: Basics of Deep Learning

Introduction to Deep Learning: Foundational concept of neural networks, Feed forward Neural Networks, Recurrent Neural Networks, Convolutional Neural Networks, and Radial Basis Function Networks, basics of Convolutional Neural Network, Sequence Models, Neural networks and Generative AI, Use case with Neural networks and Generative AI Gaussian Mixture Models, Natural Language Processing, Computer Vision.

1.	Introduction to Machine Learning	Prof. Balaraman Ravindran	IIT Madras
2.	Machine Learning	Prof. Carl Gustaf Jansson	KTH, The Royal Institute of Technology

**CSXXXXXX: Introduction to Machine Learning Lab
(1 credit-15 Hours)**

Laboratory/Practicals:

Python Introduction:

Loops and Conditions and other preliminary stuff,

Functions, Classes and Modules,

Exceptions, Database access,

Mathematical computing with Python packages like: numpy, Matplotlib, pandas, Tensor Flow, Keras

Implement basic ML models like SVM, KNN, K-Means, Logistic Regression, Linear Regression

**CSXXXXXX Artificial Intelligence
(4 credits-60 Hours)**

Course Objective:

Students will learn the basic concepts and techniques of Artificial Intelligence. They should be able to develop AI algorithms for solving practical problems.

Course outcomes: After completion of course, students would be able to:

Understand the basic concepts and techniques of Artificial Intelligence.

Apply AI algorithms for solving practical problems

Describe human intelligence and AI

Explain how intelligent system works.

Apply basics of Fuzzy logic and neural networks.

Explain Expert System and implementation

Module 1: Introduction

Artificial Intelligence and its applications, Artificial Intelligence Techniques, Level of models, criteria of success, Intelligent Agents, Nature of Agents, Learning Agents. AI Techniques, advantages, and limitations of AI, Impact and Examples of AI, Application domains of AI. The AI Ladder - The Journey for Adopting AI Successfully, Advice for a career in AI, Hotbeds of AI Innovation.

Module 2: Problem solving techniques

State space search, control strategies, heuristic search, problem characteristics, production system characteristics., Generate and test, Hill climbing, best first search, A* search, Constraint satisfaction problem, Mean-end analysis, Min-Max Search, Alpha-Beta Pruning, Additional refinements, Iterative-Deepening.

Module3: Logic

Propositional logic, predicate logic, Resolution, Resolution in propositional logic and predicate logic, Clause-form, unification algorithm,

Module4: Knowledge Representation schemes and reasoning

Mapping between facts and representations, Approaches to knowledge representation, procedural vs declarative knowledge, Forward vs. Backward reasoning, Matching, conflict resolution, Non-monotonic reasoning, Default reasoning, statistical reasoning, fuzzy logic Weak and Strong filler structures, semantic nets, frame, conceptual dependency, scripts

Module5: Planning

The Planning problem, planning with state space search, partial order planning, planning graphs, planning with propositional logic, Analysis of planning approaches, Hierarchical planning, conditional planning, Continuous and Multi Agent planning.

Tutorial List:

Numerical type questions on CNN-

Parameter tuning
Convolution function
Different types of filters
Fuzzy Logic and Neural Networks

1.	An Introduction to Artificial Intelligence	Prof. Mausam	IIT Delhi
2.	Artificial Intelligence	Prof. Sudeshna Sarkar	IIT Kharagpur

Any one course from following options can be opted under 'Open Elective I':

IOT Robotics

CSXXXXXX IOT (3 credits-45 Hours)

Course Objective:

Understanding core technology, applications, sensors used and IOT architecture along with the industry perspective. Principles and operations of different types of sensors commonly used on mobile platform will be taught in a manner that by the end of the course the students will be able to design and implement

real time solutions using IOT.

Course outcomes: After completion of course, students would be able to:

Understand core technology, applications, sensors used and IOT architecture along with The industry perspective. Understand Raspberry's working and implementation.
Understand various communication protocols used in IoT.
Apply various IOT technologies in real-life applications.

Module 1:

Introduction to IoT: What is IoT, how does it work? Difference between Embedded device and IoT device, Properties of IoT device, IoT Ecosystem, IoT Decision Framework, IoT Solution Architecture Models, Major IoT Boards in Market

Module 2:

Setting Up Raspberry/Arduino to Create Solutions: Explore Raspberry Pi, setting up Raspberry Pi, showing working of Raspberry Pi using SSH Client and Team Viewer, Understand Sensing actions, Understand Actuators and MEMS

Module 3:

Communication Protocols used in IoT: Types of wireless communication, Major wireless Short-range communication devices, properties, comparison of these devices (Bluetooth, WIFI, ZigBee, 6LoWPAN), Major wireless Long-range communication devices, properties, comparison of these devices (Cellular-IoT, LPWAN)

Module 4 :

IoT Applications: Industrial Internet 4.0, Applications such as: Smart home, wearables, smart city, smart grid, connected car, connected health (digital health, telehealth, telemedicine), smart retail

Module 5:

Sensors: Applications of various sensors: Google Maps, Waze, WhatsApp, Ola Positioning sensors: encoders and accelerometers, Image sensors: cameras, Global positioning sensors: GPS, GLONASS, IRNSS, Galileo and indoor localization systems, Motion & Orientation Sensors: Accelerometer, Magnetometer, Proximity Sensor, Gyroscope Calibration, noise modeling and characterization and noise filtering and sensor data processing. Privacy & Security

1.	Introduction to Internet of Things	Prof.Sudip Misra	IIT Kharagpur
2.	Introduction to Industry4.0 and Industrial Internet of Things	Prof.Sudip Misra	IIT Kharagpur

CSXXXXXXRobotics
(3 credits-45Hours)
CourseObjective:

The students will be able to understand the basic concepts and fundamentals of robotics. They will also be able to use AI in the field of robotics.

Courseoutcomes: After completion of course, students would be able to:

Understand the basics of robotics

Understand game playing concepts involving robotics and AI.

Apply robotics to create robot driven systems.

Analyze and co-relate robotics with AI and use in real-world applications.

Module1:

Introduction: Introduction to Robotics Fundamentals of Robotics, Robot Kinematics: Position Analysis, Dynamic Analysis and Forces, Robot Programming languages & systems: Introduction, the three levels of robot programming, requirements of a robot programming language, problems peculiar to robot programming languages.

Module2:

Need of AI in Robotics: History, state of the art, Need for AI in Robotics. Thinking and acting-humanly, intelligent agents, structure of agents.

Module3:

Game Playing: AI and game playing, plausible move generator, static evaluation move generator, game playing strategies, problems in game playing.

Module4:

Robotics fundamentals: Robot Classification, Robot Specification, notation, kinematic representation - and transformations, dynamic techniques; trajectory planning and control.

Module5:

Robotics and its applications: DDD concept, Intelligent robots, Robot anatomy-Definition, law of robotics, History and Terminology of Robotics-Accuracy and repeatability of Robotics-Simple problems-Specifications of Robot-Speed of Robot, Robot joints and links-Robot classifications-Architecture of robotics systems-Robot Drive systems-Hydraulic, Pneumatic and Electric system

Suggested Readings

Robotics: Everything You Need to Know About Robotics from Beginner to Expert, Peter McKinnon, Createspace Independent Publishing Platform, 2016.

Introduction to AI Robotics, Second Edition, By Robin R. Murphy, MIT press, 2001.

Artificial Intelligence for Robotics: Build intelligent robots that perform human tasks using AI techniques, Francis X.

Govers, Packt Publishers, 2018

Alternative NPTEL/SWAYAM Course:

S.No.	NPTEL Course Name	Instructor	Host Institute
1.	Introduction to Robotics	Prof. Asokan T, Prof. Balaraman Ravindran, Prof. Krishna Vasudevan	IIT Madras
2.	Robotics	Prof. Dilip Kumar Pratihari	IIT Kharagpur

SEMESTER-IV**CSXXXXXX: Theory of Computation
(4 credits-60 Hours)****Course Objective:**

Students should be able to understand fundamental mathematical and computational principles that are foundations of computer science. They should learn about abstract models of computation, finite representations for languages and gain formal understanding of algorithms and procedures.

Course Outcomes:

After completion of course, students would be able to:

Evaluate computer science problems as mathematical statements and to formulate proofs.

Understand properties of the corresponding language classes defined by various computation models and the relations between them.

Understand the general properties of computation and learn how to increase efficiency at which computers solve problems.

Understand how to model different computation problems using state machines.

Module 1: Automata

Introduction to formal proof, Additional forms of proof, Inductive proofs, Finite Automata (FA), Deterministic Finite Automata (DFA), Non-deterministic Finite Automata (NFA), Finite Automata with Epsilon transitions.

Module 2: Regular Expressions and Languages

Regular Expression, FA and Regular Expressions, proving languages not to be regular, Closure properties of regular languages, Equivalence and minimization of Automata.

Module 3: Context-Free Grammars and Languages

Context-Free Grammar (CFG), Parse Trees, Ambiguity in grammars and languages, Definition of the Pushdown automata, Languages of a Pushdown Automata, Equivalence of Pushdown automata and CFG Deterministic Pushdown Automata.

Module 4: Properties of Context-Free Languages

Normal forms for CFG, Pumping Lemma for CFL, Closure Properties of CFL, Turing Machines, Programming Techniques for TM, Variations of TM, Non-Universal TM, Universal TM.

Module5: Undecidability

Alanguage that is not Recursively Enumerable (RE), An undecidable problem that is RE Undecidable problems about Turing Machine, Post's Correspondence Problem, The classes P and NP.

Suggested Readings

J.Martin, "Introduction to Languages and the Theory of computation" Third Edition, Tata McGraw Hill. 2007

Alternative NPTEL/SWAYAM Course (if any):

S.No.	Course Name	Instructor	Host Institute
1.	Theory of Computation-Videocourse	Prof. Somenath Biswas	IIT Kanpur
2.	Theory of Computation	Prof. Ragunath Tewari	IIT Kanpur

**CSXXXXXX: Software Engineering
(3 credits-45 Hours)****Course Objective:**

Students should learn the concept and importance of Software Engineering. They should be able to construct software that is reasonably easy to understand, modify, maintain and reliable. They should learn strengths and weaknesses of various Software Engineering Techniques used in industrial applications.

Course Outcomes:

After completion of course, students would be able to:

Understand the process of designing, creating and maintaining software.

Create software for various application domains.

Understand the challenges of large scale software development.

Understand the importance of software design and development practices.

Module1: Introduction and Software Process Models

Software, Software Engineering, Myths, Software Process, Work Products, Importance of Software Engineering, Standard for Software Process, Waterfall Model, Prototyping Model, Iterative Enhancement Model, Spiral Model, RAD model, 4th Generation models, Formal Methods, Agile Development

Module2: Requirement Engineering and Software Project Management

Software Requirements, Types of Requirements, Requirement Engineering Cycle, Requirements Specification document, Characteristics of Requirements, Requirement verification and validation, Role of Management in Software Development, Project Estimation Techniques, Staffing, Scheduling, Earned Value Analysis, Software Risks, Software Configuration Management, Software Process and Project metrics.

Module3:Software Design and Coding

Process, Data and Behavioural Modelling, Design Concepts, Modularity, Architectural design, Coupling and Cohesion, Top-down and bottom-up design, Object-oriented Analysis, Function-oriented and Object-Oriented Design approach, Software Design Document, Coding styles and documentation,

Module4:Testing and Software Quality

Testing principles, testing strategies, Black-box and White-box Testing Techniques, Levels of testing-unit, integration, system, regression, Test Plan, Test Cases Specification, Software debugging, Software-Maintenance, Software Quality Assurance (SQA), SQA tasks, Software amplification and removal, Formal Technical Reviews, Software Quality Factors, ISO 9126, SEI CMM, CMMI, Software Reliability. Software Availability.

Module5: Computer Aided Software Engineering and Advanced Topics

Computer Aided Software Engineering (CASE) and its Scope, CASE support in Software Life Cycle, Architecture of CASE Environment, Upper CASE and Lower CASE, Exposure to CASE tools. Software Process Improvement, Component Based Software Engineering, Web Engineering, Reverse Engineering, Software Engineering challenges of Big Data, Mobile Applications.

Software Engineering, N.S. Gill, Khanna Publishing Co., Delhi 2018.

Software Engineering, Ian Sommerville, Addison-Wesley, 2010

An Integrated Approach to Software Engineering, Pankaj Jalote, Narosa, 2014

Fundamentals of Software Engineering, By Rajib Mall, PHI Learning Pvt. Ltd, 2014

Software Engineering (3rd ed.), By K. K. Aggarwal & Yogesh Singh, New Age International Publishers, 2007

Alternative NPTEL/SWAYAM Course(if any):

S.No.	NPTEL Course Name	Instructor	Host Institute
1.	Software Engineering	Prof. Rajib Mall	IIT Kharagpur
2.	Software Engineering- Videocourse	Prof. N.L. Sarda, Prof. Rushikesh K Joshi, Prof. Umesh Bellur	IIT Bombay

**CSXXXXXX: Software Engineering Lab
(1 credit-15 Hours)**

Laboratory/Practicals:

Programming Exercises for software design concepts.

Programming Exercises for software testing concepts.

Programming Exercises for Project Management concepts.

Design and Develop UML diagrams for any Software Project.

Project Development with Software Engineering practices.

CSXXXXXX:Deep Learning
(3credits-45Hours)

CourseObjective:

To introduce the fundamentals of deep learning and the main research activities in this field. To learn architectures and optimization methods for deep neural network training.

CourseOutcomes: After completion of course, students would be able to:

Understand the fundamentals of deep learning and the main research activities in this field

Remember architectures and optimization methods for deep neural network training

Implement, apply and test relevant learning algorithms in TensorFlow

Critically evaluate the method's applicability in new contexts and construct new applications

Module1: Introduction

History of Deep Learning, McCulloch Pitts Neuron, Multilayer Perceptrons (MLPs), Representation Power of MLPs, Sigmoid Neurons, Feed Forward Neural Networks, Backpropagation

Module2: Activation functions and parameters

Gradient Descent (GD), Momentum Based GD, Nesterov Accelerated GD, Stochastic GD, Principal Component Analysis and its interpretations, Singular Value Decomposition, Parameters vs Hyper-parameters

Module3: Auto-encoders & Regularization

Auto encoders and relation to PCA, Regularization in auto encoders, Denoising auto encoders, Sparse auto encoders, Regularization: Bias Variance Tradeoff, L2 regularization, Early stopping, Dataset augmentation, Encoder Decoder Models, Attention Mechanism, Attention over images, Batch Normalization

Module4: Deep Learning Models

Introduction to CNNs, Architecture, Convolution/pooling layers, CNN Applications, LeNet, AlexNet, ZF-Net, VGGNet, GoogLeNet, ResNet. Introduction to RNNs, Back propagation through time (BPTT), Vanishing and Exploding Gradients, Truncated BPTT, GRU, LSTMs

Module5: Deep Learning Applications

Image Processing, Natural Language Processing, Speech recognition, Video Analytics

Suggested Readings

2.	Deep Learning	Prof. Prabir Kumar-Biswas	IIT Kharagpur

**CSXXXXXX:DeepLearningLab
(1credit-15Hours)**

Laboratory/Practicals:

Implementation of following deep learning algorithms in Python using TensorFlow: Convolution Neural Network
Implementation of following deep learning algorithms in Python using TensorFlow: Recurrent Neural Network
Project work involving application of Deep Learning

**CSXXXXXX:Operating System
(3credits-45Hours)**

Course Objective:

Students should be able to describe the services provided by and the design of an operating system. They should be able to understand the structure and organization of the file system, process synchronization, process scheduling, system calls and different approaches to memory management.

Course Outcomes: After completion of course, students would be able to:

Understand the basics of an operating system and its major components.

Understand and implement shell programming.

Create and/or modify concurrent programs.

Apply security as well as recovery features in the design of an algorithm.

Module 1: Concepts of Operating Systems

Computer system overview, concept of an operating system, batch system, multiprogramming, multiprocessing, multi user, time sharing, personal system, parallel system, real time system, simple monitors, general system architecture, System components, operating system services, system calls, system programs, system structure, Approaches to OS design and implementation: Microkernel, Layered, Kernel Approach

Module 2: Processes and Threads

Concept of process, process states, process state transitions, process control block, operations on processes, threads, concurrent processes, mutual exclusion and synchronization, principles of deadlocks, integrated deadlocks strategy, scheduling levels, scheduling criteria, Interprocess synchronization, Inter process communication, Linux, IPC Mechanism, Remote procedure calls, RPC exception handling, security issues

Module 3: Memory Management and Data Management

Logical and physical address space, storage allocation and management techniques, swapping concepts of multiprogramming, paging, segmentation, virtual storage management strategies, demand paging, page replacement algorithm, thrashing, File organization, record blocking, access

method, directory structure, protection file system structure, allocation methods, free space management, directory implementation, disk structure, disk scheduling, disk management, buffering, swap space management, RAID levels

Module4:OS Security

Types of Threats in OS, Basic OS Security Mechanisms, Understanding the Threats: Malware Taxonomy: Viruses, Worms, Rootkits, Defence: An Overview, Logging, Auditing, and Recovery, OS-level Memory Protection

Module5:Case Studies and OS Abstractions

Linux/Unix OS design and architecture, Unix shell, Unix operating system services, user perspective, representation of files in Unix system processes and their structure, input-output system, memory management in Unix, Processes: fork, wait, exec, exit, kill, getpid, brk, nice, sleep, trace, Files: open, close, read, write, lseek, stat, sync, Directories: mkdir, rmdir, link, unlink, mount, umount, users +, Security: chown, chmod, getuid, setuid, Inter process communication: signals, pipe, Networking: socket, accept, snd, recv, connect

Suggested Readings

Operating system, Galvin & Silberschatz, 7th Edition, John Wiley 2004

Operating Systems - A Concept Based Approach, Dhamdhare, TMH 2006

Operating System Concepts, Ekta Walia, Khanna Book Publishing 2020.

Operating systems Internals and design principles By William Stallings, Pearson Education, 2012

Operating Systems - A Design Oriented Approach, Crowley, TMH, 2001

Operating systems Design and Implementation, Andrew S. Tanenbaum, Pearson Education 2009

Alternative NPTEL/SWAYAM Course (if any):

S.No.	Course Name	Instructor	Host Institute
1.	Operating System Fundamentals	Prof. Santanu Chattopadhyay	IIT Kharagpur
2.	Operating System	Prof. Sorav Bansal	IIT Delhi

**CSXXXXXX: Operating System Lab
(1 credit-15 Hours)**

Laboratory/Practicals:

To perform shell programming.

Implement memory management techniques like paging or segmentation.

Implement any file allocation technique (Linked, Indexed or Contiguous).

Use the following system calls of UNIX operating system: mkdir, rmdir, link, unlink, mount, umount, users +, chown, chmod, getuid, setuid.

Use the following system calls of UNIX operating system: fork, wait, exec, exit, kill, getpid, brk, nice, sleep, trace, open, close, read, write, lseek, stat, sync

Use the following system calls of UNIX operating system: signals, pipe, socket, accept, snd, recv, connect.

**CSXXXXXX: Theory of computation Ecosystems
(3 credits-45 Hours)**

Course Objective:

The student should study the development of start-up projects in the realm of globalisation, crowdsourcing and the emergence of "open-source" innovations. They should be able to search for the governmental

means of support for open innovation projects, private investment resources, and assess the level of maturity of the project.

Course Outcomes:

After completion of course, students would be able to:

Understand economic models in the digital environment and types of monetisation used for open innovations.

Create a business model of value in the open-knowledge environment.

Module 1: Introduction

Introduction to Entrepreneurship Strategy: from Ideation to Exit, identifying the trade-offs, Intellectual activity & knowledge economy, sharing economy – approach to construct social-economic models, Business as construction of value creation chain in the context of open knowledge,

Module 2: Digital technologies as an open innovation's environment

Transaction costs: trust and reviewing system (personification), Hard & software - Robotics and Intelligence: Computing Recognition and Decision Making, Infrastructure Building, Cyberphysical systems as a product and as an infrastructure.

Module 3: The organization and management of open innovation projects

History the emergence of open innovation, Analysis of elements of open innovation in the traditional management, Agile – flexible project management. Methodologies within agile approach, from project to product: steps of converting ideas into goods, Stakeholders of open innovation project: customers, investors, employees etc. Indicators of effectiveness for the various groups of stakeholders.

Module 4: Start-up environment: institutions that support and finance innovative projects

Types of financing, Infrastructures supporting small innovative enterprises and start-ups, Programs to support innovative projects at the federal and regional level.

Module 5: Operational and Strategy Management

Introduction to Operations Management:

Operations Analysis, Coordination and Planning, Quality Management, Project Management, and Logistics and Supply Chain Management, strategy management, technological strategy.

Suggested Readings

Text Books:

Innovation and Entrepreneurship by Peter F. Drucker (Classic Drucker Collection, 2007)

Joseph A. Schumpeter's views on entrepreneurship and innovation by Perihan Hazel.

Alternative NPTEL/SWAYAM Course (if any):

	SWAYAM Course Name	Instructor	Host Institute
1.	Innovation and Start-up Policy	Prof. Rahul K. Mishra	IILM Institute for Higher Education

CSXXXXXX: Introduction to Machine Learning Lab
(1 credit-15 Hours)

Laboratory/Practicals:

Python Introduction:

Loops and Conditions and other preliminary stuff,

Functions, Classes and Modules,

Exceptions, Database access,

Mathematical computing with Python packages like: numpy, Matplotlib, pandas, Tensor Flow, Keras

Implement basic ML models like SVM, KNN, K-Means, Logistic Regression, Linear Regression

CSXXXXXX Environmental Science
(3 credits-45 Hours)
Course Objective:

People working in industries or elsewhere essentially require the knowledge of environmental science so as to enable them to work and produce most efficient, economical and eco-friendly finished products.

Solve various engineering problems applying ecosystem to produce eco-friendly products.

Use relevant air and noise control methods to solve domestic and industrial problems.

Use relevant water and soil control methods to solve domestic and industrial problems.

To recognize relevant energy sources required for domestic and industrial applications.

Solve local solid and waste problems.

Course outcomes: After completion of course, students would be able to:

Understand the ecosystem and terminology and solve various engineering problems applying ecosystem knowledge to produce eco-friendly products.

Understand the suitable air, extent of noise pollution, and control measures and acts.

Understand the water and soil pollution, and control measures and acts.

Understand different renewable energy resources and efficient processes of harvesting.

Understand solid Waste Management, ISO 14000 & Environmental Management.

Unit-1: Ecosystem

Structure of ecosystem, Biotic & Abiotic components.

Food chain and food web.

Aquatic (Lentic and Lotic) and terrestrial ecosystem.

Carbon, Nitrogen, Sulphur, Phosphorus cycle.

Global warming - Causes, effects, process, Green House Effect, Ozone depletion.

Unit-2: Air and Noise Pollution

Definition of pollution and pollutant. Natural and man-made sources of air pollution (Refrigerants, I.C., Boiler). Air Pollutants: Types, Particulate Pollutants: Effects and control (Bag filter, Cyclone separator, Electrostatic Precipitator).

Gaseous Pollution Control: Absorber, Catalytic Converter, Effects of air pollution due to Refrigerants, I.C., Boiler.

Noise pollution: sources of pollution, measurement of pollution level, Effects of Noise pollution, Noise pollution (Regulation and Control) Rules, 2000.

Unit-3: Water and Soil Pollution

Sources of water pollution, Types of water pollutants, Characteristics of water pollutants Turbidity, pH, total suspended solids, total solids BOD and COD: Definition, calculation.

Waste Water Treatment: Primary methods: sedimentation, froth floatation, Secondary methods: Activated sludge treatment, Trickling filter, Bioreactor, Tertiary Method: Membrane separation technology, RO (reverse osmosis).

Causes, Effects and Preventive measures of Soil Pollution: Causes-Excessive use of Fertilizers, Pesticides and Insecticides, Irrigation, E-Waste.

Unit-4: Renewable sources of Energy

Solar Energy: Basics of Solar energy. Flat plate collector (Liquid & Air). Theory of flat plate collector. Importance of coating. Advanced collector. Solar pond. Solar water heater, solar dryer. Solar stills.

Biomass: Overview of biomass as energy source. Thermal characteristics of biomass as fuel. Anaerobic digestion. Biogas production mechanism. Utilization and storage of biogas.

Wind energy: Current status and future prospects of wind energy. Wind energy in India. Environmental benefits and problem of wind energy.

New Energy Sources: Need of new sources. Different types of new energy sources. Applications of (Hydrogen energy, Ocean energy resources, Tidal energy conversion.) Concept, origin and power plants of geothermal energy.

Unit-5: Solid Waste Management, ISO 14000 & Environmental Management

Solid waste generation- Sources and characteristics of: Municipal solid waste, E-waste, biomedical waste.

Metallic wastes and Non-Metallic wastes (lubricants, plastics, rubber) from industries. Collection and disposal: MSW (3R, principles, energy recovery, sanitary landfill), Hazardous waste.

Air quality act 2004, air pollution control act 1981 and water pollution and control act 1996. Structure and role of Central and state pollution control board.

Concept of Carbon Credit, Carbon Footprint.

Environmental management in fabrication industry.

ISO 14000: Implementation in industries, Benefits.

Teachers should use the following strategies to achieve the various outcomes of the course.

Different methods of teaching and media to be used to attain classroom attention.

Massive open online courses (MOOCs) may be used to teach various topics/subtopics.

15-20% of the topics which are relatively simpler or descriptive in nature should be given to the students for self-learning and assess the development of competency through classroom presentations.

Micro-projects may be given to groups of students for hands-on experiences.

Encouraging students to visit sites such as Railway station and research establishments around the institution.

CSXXXXXX Minor Project (3 credits-45 Hours)

SEMESTER V

CSxxxx: DATA AND VISUAL ANALYTICS IN AI (3 credits-45 Hours)

Course Objectives

The student will be able to understand techniques and algorithms for creating effective visualizations based on principles from graphic design. They will also be introduced to several industry-standard software tools to create a compelling and interactive visualization of various types of data.

Course Outcomes

Understand the key techniques and theory used in visualization, including data models, graphical perception, and techniques for visual encoding and interaction. (Understanding)

Apply knowledge to a number of common data domains and corresponding analysis tasks, including multi-variate data, networks, text, and cartography. (Applying)

Describe big data and use cases from selected business domains. (Analyzing)

Explain NoSQL big data management and other technologies such as Hadoop and HDFS. (Analyzing)

Module I (8 Hours)

Introduction: Data for Graphics, Design principles, Value for visualization, Categorical, time series, and statistical data graphics, Introduction to Visualization Tools

Module II (12 Hours)

Graphics Pipeline and Aesthetics and Perception Introduction, Primitives: vertices, edges, triangles, Model transforms: translations, rotations, scaling, View transform, Perspective transform, window transform, Graphical Perception Theory, Experimentation, and the Application, Graphical Integrity, Layering and Separation, Color and Information, Using Space

Module III (8 Hours)

Visual Display of Quantitative Information, Data-Ink Maximization, Graphical Design, Exploratory Data Analysis, Heat Map.

Module IV (9 Hours)

Query, Analysis and Visualization of Multi-Dimensional Relational Databases, Interactive Exploration, tSNE, Interactive Dynamics for Visual Analysis, Visual Queries, Finding Patterns in Time Series Data, Trend visualization, Animation, Dashboard, Visual Storytelling.

Module V (8 Hours)

Graph Visualization and Navigation, Online Social Networks, Social Data Analysis, Collaborative Visual Analytics, Text, Map, Geospatial data.

Suggested Readings

The Visual Display of Quantitative Information by E. Tufte, Graphics Press, 2nd Edition, 2001
 Beginner's Guide for Data Analysis using R Programming, Jeeva Jose, Khanna Publishing 2019.

CSNLxxxx: NATURAL LANGUAGE PROCESSING

(3 Credits - 45 Hours)

Objectives

The students should be able to study language and the tools that are available to efficiently study and analyze large collections of text. They should learn about and discuss the effects of electronic communication on our language.

Course Outcomes

Recall algorithms and methods for building computational models of natural language processing (Remembering)
 Explain syntactic analysis, semantic representations, discourse analysis, and statistical and corpus-based methods for text processing and knowledge acquisition. (Understanding)
 Apply the methods of natural language processing. (Applying)
 Analyse Issues involved in natural language processing. (Analysing)
 Evaluate and generate applications that can benefit from natural language processing, such as information extraction, question answering, machine translation, and spoken language understanding. (Evaluating & creating)

Module I (10 hours)

A computational framework for natural language, description of English or an Indian language in the framework, lexicon, algorithms and data structures for implementation of the framework, Finite state automata, the different analysis levels used for NLP (morphological, syntactic, semantic, pragmatic, Recursive and augmented transition networks. Applications like machine translations.

Module II (15 hours)

Word Level Analysis: Regular Expressions, Finite-State Automata, Morphological Parsing, Spelling Error Detection and correction, Words and Word classes, Part-of Speech Tagging. Syntactic Analysis: Context-free Grammar, Constituency, Parsing-Probabilistic Parsing. Machine readable dictionaries and lexical databases, RTN, ATN.

Module III (10 hours)

Semantic Analysis: Meaning Representation, Lexical Semantics, Ambiguity, Word Sense Disambiguation. Discourse Processing: cohesion, Reference Resolution, Discourse Coherence and Structure. Knowledge Representation, reasoning.

Module IV (7 hours)

Natural Language Generation (NLG): Architecture of NLG Systems, Generation Tasks and Representations, Application of NLG. Machine Translation: Problems in Machine Translation, Characteristics of Indian Languages, Machine Translation Approaches, Translation involving Indian Languages.

Module V (3 hours)

Information Retrieval: Design features of Information Retrieval Systems, Classical, Non-classical, Alternative Models of Information Retrieval, valuation Lexical Resources: World Net, Frame Net, Stemmers, POS Tagger.

Suggested Readings:

Natural Language understanding by James Allen, Pearson Education, 2002.
 NLP: A Paninian Perspective by AksharBharati, VineetChaitanya, and Rajeev Sangal, Prentice Hall, 2016.
 Meaning and Grammar by G. Chirchia and S. McConnell Ginet, MIT Press, 1990.
 An Introduction to Natural Language Processing, Computational Linguistics, and Speech Recognition by Daniel Jurafsky and James H. Martin, Pearson Education, 2006.
 Natural language processing in Prolog by Gazdar, &Mellish, Addison-Wesley

CSPxxxx: ADVANCED MACHINE LEARNING
(3 credits-45 Hours)

Course Objectives

To introduce advanced concepts and methods of machine learning and to develop an understanding of the role of machine learning in massive scale automation.

To design and implement various machine learning algorithms in a range of real-world applications.

Course Outcomes

Understand advanced concepts and methods of machine learning and to develop an understanding of the role of machine learning in massive scale automation. (Understanding)

Apply various machine learning algorithms in a range of real-world applications. (Applying)

Integrate and apply their expertise to produce solutions for real-world problems. (Applying and Creating)

Interpret and Analyze results with reasoning using different ML techniques. (Analyzing)

Module I (10 Hours)

Introduction to ANN, Perceptron, Cost Function, Gradient Checking, multi-layer perceptron and backpropagation algorithm that is used to help learn parameters for a neural network, Random Initialization.

Module II (11 Hours)

Probability theory and Bayes rule, Naive Bayes learning algorithm, Bayes nets.

Module III (8 Hours)

Representing concepts as decision trees, Recursive induction of decision trees, best splitting attribute: entropy and information gain. Searching for simple trees and computational complexity, Overfitting, noisy data, and pruning.

Module IV (8 Hours)

Reinforcement learning through feedback network, function approximation.

Module V (8 Hours)

Bagging, boosting, stacking and learning with ensembles. Random Forest

Suggested Readings

Tom Mitchell, Machine Learning, McGraw Hill, 1997.

Jeeva Jose, Introduction to Machine Learning, Khanna Book Publishing 2020.

Rajiv Chopra, Machine Learning, Khanna Book Publishing 2021

CSPxxxx: OPTIMIZATION TECHNIQUES IN MACHINE LEARNING
(4 credits- 60 Hours)

Course Objectives

The students will be able to understand and analyze how to deal with changing data. They will also be able to identify and interpret potential unintended effects in your project. They will understand and define procedures to operationalize and maintain your applied machine learning model.

Course Outcomes

Know the concept of optimality criteria for various types of optimization problem (Remembering)

Assess / Evaluate the most important algorithms, function classes, and algorithm convergence guarantees. (Evaluate)

Compose existing theoretical analysis with new aspects and algorithm variants. (Understand)

Formulate scalable and accurate implementations of the most important optimization algorithms for machine learning applications. (Applying)

Characterize trade-offs between time, data and accuracy, for machine learning methods. (Analyze)

Module I (10 Hours)

Introduction: What is optimization, Formulation of LPP, Solution of LPP: Simplex method, Basic Calculus for optimization: Limits and multivariate functions, Derivatives and linear approximations: Singlevariate functions and multivariate functions.

Module II (11 Hours)

Machine Learning Strategy: ML readiness, Risk mitigation, Experimental mindset, Build/buy/partner, setting up a team, Understanding and communicating change.

Module III (8 Hours)

Responsible Machine Learning: AI for good and all, Positive feedback loops and negative feedback loops, Metric design and observing behaviours, Secondary effects of optimization, Regulatory concerns.

Module IV (8 Hours)

Machine Learning in production and planning: Integrating info systems, users break things, time and space complexity in production, when to retain the model? Logging ML model versioning, Knowledge transfer, Reporting performance to stakeholders.

Module V (8 Hours)

Care and feeding of your machine learning model: MLPL Recap, Post deployment challenges, QUAM monitoring and logging, QUAM Testing, QUAM maintenance, QUAM updating, Separating Datastack from Production, Dashboard Essentials and Metrics monitoring.

Suggested Readings

Jeeva Jose, Introduction to Machine Learning, Khanna Book Publishing 2020.

Rajiv Chopra, Machine Learning, Khanna Book Publishing 2021

Optimization for Machine Learning, SuvritSra, Sebastian Nowozin and Stephen J. Wright, MIT Press, 2011.

CSXXXX: MINOR PROJECT

(3 Credits – 45 Hours)

Course Outcomes

1. Recall the software development life cycle and fundamental phases of system/application/software design and research. (Remembering)
2. Explain how to carry out a project work and explain the importance of different phase of a system design, workflow and time estimation with research outlook. (Understanding)
3. Implement a system and plan how to perform research for real time application. (Applying)
4. Compare the feasibility of a project in terms of time, effort and money.(Analyze)
5. Evaluate a project based on its efficiency applicability robustness, user friendliness etc., with socio economic factors (Evaluating)
6. Design applications by critically examining and scientifically designing each phase of the project.(Creating)

INDIAN CONSTITUTION

(3 credits-45 Hours)

Course Objectives

This course is designed to introduce the students to the basics of Constitutional Law. The students will be introduced to a brief historical background to the framing of India's Constitution, the salient features of the Constitution of India and the nature of polity established under this Constitution in India. It will also help the students understand the kind of government established, the values and commitments of this Constitution and the basic framework of governance established hereunder. It is also designed to appraise the learners of the roles to be played by different political institutions in India.

Course Outcomes

Know the importance of Constitution and Government, Fundamental Rights and Duties, Directive Principles. (Remembering)

Learn about the role of PM, President, Council of Ministers, and Local Administration. (Understand)

Understand the functioning of three wings of the government i.e., executive, legislative and judiciary. (Understanding)

Become Good Citizens and know their fundamental rights, duties, and principles. (Applying)

Analyze the decentralization of power between central, state and local self-government. (Analyze)

Module I (8 Hours)

The Constitution – Introduction: The History of the Making of the Indian Constitution, Preamble and the Basic Structure, and its interpretation, Fundamental Rights and Duties and their interpretation, State Policy Principles

Module II (10 Hours)

Union Government: Structure of the Indian Union, President – Role and Power, Prime Minister and Council of Ministers, Lok Sabha and Rajya Sabha.

Module III (10 Hours)

State Government: Governor – Role and Power, Chief Minister and Council of Ministers, State Secretariat.

Module IV (9 Hours)

Local Administration: District Administration, Municipal Corporation, Zila Panchayat.

Module V (8 Hours)

Election Commission: Role and Functioning, Chief Election Commissioner, State Election Commission.

Suggested Readings:

'Indian Polity' by Laxmikanth, 5th Edition, McGraw Hill Edition

Ethics and Politics of the Indian Constitution, Rajeev Bhargava, Oxford University Press, New Delhi, 2008

The Constitution of India, B.L. Fadia, Sahitya Bhawan; New edition (2017)

Introduction to the Constitution of India, D. D Basu, Lexis Nexis; Twenty-Third 2018 edition

CSSNxxx: NATURAL LANGUAGE PROCESSING LAB

(1 credit – 15 Hours)

Course Outcomes

List the functions provided by NLTK for natural language processing. (Knowledge)

Explain of the various NLTK functions and corpora available for natural language processing. (Understanding)

Implement NLTK programs for part of speech tagging, syntax analysis, semantic analysis etc. (Applying)

Analyze the structure and meaning of given text. (Analyzing)

Evaluate the performance of classifiers used for text classification. (Evaluating)

Combine different NLTK functions to build applications for natural language processing and understanding. (Creating)

Module I (4 Hours)

Natural Language Toolkit (NLTK): Installation and getting started; Accessing text corpora; Ngrams; Conditional Frequency Distribution; Regular expressions for detecting word patterns; Regular expressions for tokenizing text

Module II (3 Hours)

Using a tagger; Tagged corpora; Automatic tagging, Ngram tagging;

Module III (4 Hours)

Classify text; supervised classification; Naive Bayes classifiers; Information extraction; Chunking; Named entity recognition; Relation extraction

Module IV (4 Hours)

Parsing with context free grammars; Dependency grammar; Grammar development; Grammatical features; Processing feature structures; Natural language understanding; Propositional logic; First order logic

Suggested Readings

Steven Bird, Ewan Klein, Edward Loper, Natural Language Processing with Python, O'Reilly Media.
Jacob Perkins, Python Text Processing with NLTK 2.0 Cookbook, O'Reilly Media.

SEMESTER VI
CSxxxxxx: INDUSTRY/RESEARCH LAB INTERNSHIP
(16 credits – 490 Hours)
Course Outcomes

Demonstrate knowledge of professional and ethical responsibilities in AI/ML, focusing on data privacy, bias, and societal impact during the internship. (Understanding)
 Assess the effectiveness, efficiency, and impact of AI/ML solutions from the internship, considering accuracy, performance, scalability, and ethics. (Evaluating)
 Apply AI/ML concepts and techniques from coursework to solve practical problems in an industry or research setting during the internship. (Applying)
 Evaluate technical and business requirements of internship projects, identify challenges, and propose AI/ML solutions. (Analyzing)
 Design and implement innovative AI/ML models and systems to address specific internship tasks, showcasing creativity and technical skill. (Creating)

CSxxxxxx: MAJOR PROJECT
(10 credits – 150 Hours)
Course Outcomes

Explain how to execute a project, emphasizing the significance of various phases in system design, workflow, and time estimation with a research perspective. (Understanding)
 Develop a system and demonstrate the process of conducting research for real-time applications. (Applying)
 Assess the feasibility of a project considering factors such as time, effort, and budget. (Analyzing)
 Evaluate a project's effectiveness based on criteria like efficiency, applicability, robustness, user-friendliness, and socioeconomic impact. (Evaluating)
 Create applications by systematically planning and designing each phase of a project. (Creating)

Professional Elective Courses - 1
CSxxxxxx: Solve Business Problems with AI
(3 credits- 45 Hours)
Course Objectives

The students will be able to relate with the practical uses of AI in day-to-day businesses. They will be able to understand the cautions need to be observed while working with AI. They will also be able to apply AI to boost business productivity.

Course Outcomes

Analyze practical uses of AI in day-to-day businesses. (Analyze)
 Understand the cautions need to be observed while working with AI. (Understand)
 Apply AI to boost business productivity. (Apply)
 Use various cloud platforms. (Apply)
 Understand data privacy. (Understand)

Module I: Introduction (6 hours)

AI for businesses, optimizing business processes, Minimizing costs, AI solutions: Deep Q-learning, Action selection policies

Module II: Apply AI and ML to business problems (13 hours)

Solve Business Problems with AI and Machine Learning Course Introduction, Identify Data-Driven Emerging Technologies Module Introduction, The Data Hierarchy, Big Data, Data Mining, Applied AI and ML in Business, Appropriate Business Problems, Challenges of AI/ML, Machine Learning Model, Machine Learning Workflow, Concept Drift and Transfer Learning, Problem Formulation, Differences Between Traditional Programming and Machine Learning, Differences Between Supervised and Unsupervised Learning, Randomness and Uncertainty, Machine Learning Outcomes

Module III: How to choose the right tool? (8 hours)

importance of choosing the right tools, Hardware requirements: Parallel processors, GPUs, GPU platforms; Cloud Platforms: cloud hosting services: Amazon Web Services, Microsoft Azure, Google TPUs; Open-source AI tools, Proprietary AI tools

Module IV: Data privacy and Ethical Practices (13 hours)

Introduction, Data Protection, Data Privacy Laws, Privacy by Design, Data Privacy Principles at Odds with Machine Learning, Compliance with Data Privacy Laws and Standards, Data Sharing and Privacy, The Big Data Challenge, Preconceived Notions, The Black Box Challenge, Bias, Prejudice, and Discrimination, Ethics in NLP, Use of Data for Unintended Purposes, Intellectual Property, Humanitarian Principles, Asilomar AI Principles

Module V: Case Studies (5 hours)

Real world case study

Suggested Readings

A Classical Approach to Artificial Intelligence, M.C. Trivedi, Khanna Book Publishing.
 Artificial Intelligence in Practice by Bernard Marr, Matt Ward, O'Reilly, 2019.
 Artificial Intelligence and Machine Learning for Business: A No-Nonsense Guide to Data- Driven Technologies by Steven Finlay, Relativistic publishers, 2017.

Professional Elective Courses - 2**CSxxxxxx: AI in Gaming
(3 credits- 45 Hours)****Course Objectives**

The students should be able to understand and use AI techniques for generating efficient, intelligent behavior in games. Additional attention is to be given to AI algorithms for improving game play experience.

Course Outcomes

Understand and identify tasks that can be tackled using AI techniques. (Remember, Understand)
 Apply appropriate AI technique for the problem under investigation. (Apply)
 Create efficient and robust AI algorithms for game tasks. (Create)
 Apply learning mechanisms to gaming problems. (Apply)

Module I: Introduction (8 Hours)

Introduction to Game AI, kind of AI used in game development, model of game AI, AI engine structure..

Module II: Movement Algorithms and Steering Behaviour (9 Hours)

Kinematic movement algorithms, problems related to the steering behaviour of objects and Solutions.

Coordinated Movement and Motor Control: This unit discusses the concepts related to coordinated movements and motor control.

Module III: Pathfinding (8 Hours)

Basic Path finding Algorithms in game development, Path finding for complex solutions

Module IV: Decision-Making and Uncertainty (10 Hours)

Decision trees and state machines for game development, models for implementing knowledge uncertainty, such as fuzzy logic and Markov systems

Module V: Introduction to Learning Mechanisms (10 Hours)

Board game theory and discusses the implementation of some key algorithms, such as minimax and negamax, Random Number Generation and Minimaxing, algorithms for implementing action prediction, decision learning and reinforcement learning.

CSxxxxxx: AI in Healthcare
(3 credits- 45 Hours)
Course Objectives

The students should be able to understand how AI is transforming the practice of medicine. The students should learn the practical experience in applying machine learning to concrete problems in medicine.

Course Outcomes

Understand and apply on tree-based machine learning to estimate patient survival rates. (Understand, Apply)
 Analyze convolutional neural network image classification and segmentation models to make diagnoses of lung and brain disorders. (Analyze)
 Apply natural language processing to extract information from unstructured medical data. (Apply)
 Understand different types of prognosis models related to different diseases. (Understand)

Module I: Introduction (8 Hours)

Introduction to Game AI, kind of AI used in game development, model of game AI, AI engine structure.

Module I: Disease detection with computer vision (8 hours)

Medical Image Diagnosis, Eye Disease and Cancer Diagnosis, Building and Training a Model for Medical Diagnosis, Training, prediction, and loss, Image Classification and Class Imbalance, Generating More Samples, Model Testing

Module II: Evaluating models (11 hours)

Sensitivity, Specificity, and Evaluation Metrics, Accuracy in terms of conditional probability, Confusion matrix, ROC curve and Threshold

Image segmentation on MRI images: Medical Image Segmentation, MRI Data and Image Registration, Segmentation, 2D U-Net and 3D U-Net Data augmentation and loss function for segmentation, Different Populations and Diagnostic Technology, External validation

Module III: Linear prognostic models (11 hours)

Medical Prognosis, Atrial fibrillation, Liver Disease Mortality, Risk of heart disease, Evaluating Prognostic Models, Concordant Pairs, Risk Ties, Permissible Pairs.

Prognosis with Tree-based models:

Decision trees for prognosis, fix overfitting, Different distributions, Missing Data example, Imputation.

Module IV: Survival Models and Time (8 hours)

Survival Model, Survival function, collecting time data, Estimating the survival function.

Build a risk model using linear and tree-based models:

Hazard Functions, Relative risk, Individual vs. baseline hazard, Survival Trees, Nelson Aalen estimator.

Module V: Medical Treatment Effect Estimation (7hours)

Analyze data from a randomized control trial, Average treatment effect, Conditional average treatment effect, T-Learner, S-Learner, C-for-benefit.

CSxxxxxx: AI in Finance

(3 credits- 45 Hours)

Course Objectives

The students should be able to understand the evolution of AI-driven online wealth management platforms, robo-advisors, and learn how they work and why they're successful.

Course Outcomes

Understand the strengths and weaknesses of human financial advisors and investors. (Understand)

Understand the business model of robo/AI-advisors. (Understand)

Understand how InsurTech is redefining the insurance industry using AI techniques. (Understand, Analyze)

Understand stock selection and asset management related to financial world. (Understand, Analyze)

Module I: Introduction (9 hours)

Fintech Innovations: Series Map and Learning Goals, Introduction to InsurTech, Investment &

Market Size of the InsurTech Industry, Real Estate Tech, Residential Real Estate Tech

Startups, Commercial Real Estate Tech

Module II: Robo Advising (11 hours)

Expected Returns, Standard Deviations, and Correlation, Building an Efficient Portfolio, Diversified Investments, Exchange Traded Funds, Robo-Advisors, Pure Advisors vs Robo-Advisors, Customer support using robo advisors.

Module III: Stock Selection & Asset Management (12 hours)

Fundamental Analysis: The Passive Benchmark, Manager Performance, Stock Selection Screening: Discovering Signals and Data Issue, Neural Networks, Smart Beta, Wealth Management: Automated Portfolio Optimization, Portfolio Rebalancing Recommendations

Module IV: Compliance and Fraud Detection (8 hours)

Behavioural Profiling Analytics in Fraud Detection, Distinguishing Specialized from Generic Behaviour Analytics,

Module V: Case Studies (5 hours)

Fetch.ai, platforms or apps using AI for financial aspects.

SEMESTER VII**CSXXX: SOFT COMPUTING**

(3 credits-45 hours)

Course Objective:

Students should be able to understand soft computing concepts and techniques and foster their abilities in designing and implementing soft computing-based solutions for real-world problems.

Course Outcomes:

Understand, Identify and describe soft computing techniques and their roles in building intelligent machines. (Remembering)

Apply a soft computing methodology for a particular problem. (Understanding)

Analyze and compare solutions by various soft computing approaches for a given problem. (Analyze)

Apply genetic algorithms to combinatorial optimization problems and develop solutions. (Applying)

Evaluate and compare solutions by various soft computing approaches for a given problem. (Evaluating)

Module 1 (8 hours)

Introduction to neural networks: Structure and working of Biological Neural Network, Fundamentals of Artificial Neural Networks & Applications, Characteristics of Artificial Neural Networks, History of neural network research, characteristics of neural networks terminology.

Module 2 (12 hours)

Neural networks models and Learning Methods: Models of neuron McCulloch – Pitts model, Perceptron, Adaline model, Basic learning laws, Topology of neural network architecture, Multilayer Neural Networks, Learning Methods, Backpropagation, Counter propagation, ART, BAM, Associative memories.

Module 3 (10 hours)

Introduction of Fuzzy logic and Neuro Fuzzy Systems: Introduction, Fuzzy sets, Fuzzy model, Fuzzy rule generation Fuzzy inference system, Defuzzification, Architecture of a Neuro-Fuzzy system and its applications.

Module 4 (10 hours)

Machine Learning: Supervised learning: Primitive algorithms, Generative algorithms, Support Vector Machine, Ensemble methods. Unsupervised learning: K-means, Principal component analysis, Independent component analysis. Reinforcement learning and control.

Module 5 (5 hours)

Applications: Applications of GA & GP, Hybrid systems.

Suggested Readings:

1. Neuro fuzzy and soft computing by Jang, Pearson Education, 1996
2. Learning and Soft Computing by Kecman, Pearson Education, 2001
3. Fuzzy Sets and Fuzzy Logic - Klir and Yuan, PHI, 1995
4. Neural Network in computer Intelligence by Fu, TMH, 2003
5. Bio-Inspired Artificial Intelligence – Dario Floreano, PHI, 2008
6. Soft Computing – Ikvinderpal Singh, Khanna Book Publishing 2015.

CO3	M	H	H	H	
CO4			M	H	H
CO5	L			M	

CSXXX: Machine Learning for Data Science**(3 credits-45 hours)****Course Objective:**

The students will be able to derive practical solutions using predictive analytics. They will also understand the importance of various algorithms in Data Science.

Course Outcomes:

Understand the importance of various algorithms in Data Science. (Understanding)
 Apply practical solutions using predictive analytics. (Applying)
 Create competitive advantage from both structured and unstructured data. (Creating)
 Predict outcomes with supervised machine learning techniques. (Analysing)
 Unearth patterns in customer behavior with unsupervised techniques. (Evaluating)

Module 1(8 hours)

Introduction: Algorithms and Machine Learning, Introduction to algorithms, Tools to analyze algorithms, Algorithmic techniques: Divide and Conquer, examples, Randomization, Applications

Module 2(10 hours)

Algorithms: Graphs, maps, Map searching, Application of algorithms: stable marriages example, Dictionaries and hashing, search trees, Dynamic programming.

Module 3 (10 hours)

Application to Personal Genomics: Linear Programming, NP completeness, Introduction to personal Genomics, Massive Raw data in Genomics, Data science on Personal Genomes, Interconnectedness on Personal Genomes, Case studies

Module 4(8 hours)

Machine Learning: Introduction, Classification, Linear Classification, Ensemble Classifiers, Model Selection, Cross Validation, Holdout

Module 5 (9 hours)

Machine Learning Applications: Probabilistic modelling, Topic modelling, Probabilistic Inference, Application: prediction of preterm birth, Data description and preparation, Relationship between machine learning and statistics

Suggested Readings:

Introduction to Machine Learning, Jeeva Jose, Khanna Book Publishing House.
 Machine Learning, Rajiv Chopra, Khanna Book Publishing House.

Data Science and Machine Learning: Mathematical and Statistical Methods Machine Learning & Pattern Recognition, by Dirk P. Kroese, Zdravko Botev, Thomas Taimre, Radislav Vaisman, Chapman & Hall/Crc, 2019.

Hands-On Data Science and Python Machine Learning, Frank Kane, Packt Publishers, 2017.

CSXXX: Bioinformatics
(3 credits - 45 hours)

Course Objective:

The students should be able to understand the scope of Bioinformatics. They should know about popular bioinformatics databases and sequence alignment algorithms.

Course outcomes:

Understand the various challenges and applications of bioinformatics. (Understanding)

Analyze various biological sequence databases. (Analysing)

Apply predictive methods on DNA and protein sequences. (Applying)

Perform sequence comparison and sequence alignment. (Evaluating)

Module 1 (8 hours)

Introduction: History, scope and important contributions, aims and tasks of Bioinformatics, applications of Bioinformatics, challenges and opportunities, introduction to NCBI data model, various file formats for biological sequences.

Module 2 (12 hours)

Biological Databases and Data Search Methods: Importance of databases, biological databases, primary sequence databases, composite sequence databases, secondary databases, nucleic acid sequence databases, protein sequence databases, structure databases, bibliographic databases, specialized genomic resources,

analysis packages. Methods for searching sequence databases like FASTA and BLAST algorithms, Statistical analysis and evaluation of BLAST results.

Module 3 (8 hours)

Sequence Comparison Methods: Methods for comparison of two sequences, Needleman Wush and Smith Waterman algorithms. Analysis of computational complexities, merits and demerits of these algorithms, theory of scoring matrices and their use for sequence comparison.

Module 4 (8 hours)

Sequence Alignment Methods: Sequence analysis of biological data, significance of sequence alignment, pair wise sequence alignment methods, use of scoring matrices and gap penalties in sequence alignments, multiple sequence alignment methods, tools and applications of multiple sequence alignment.

Module 5 (9 hours)

Predictive Methods Using DNA and Protein Sequences: Gene prediction strategies, protein prediction strategies, molecular visualization tools, phylogenetic analysis: concept of trees, phylogenetic trees and multiple alignments.

Suggested Readings:

Andreas D Baxeavanis& B F Francis, "Bioinformatics-A practical guide to analysis of Genes and Proteins", John Wiley, 2010
 T K Attwood, D J Parry-Smith, "Introduction to Bioinformatics", Pearson Education, 2005
 Neil C. Jones, Pavel A. Pevzner, "An introduction to Bioinformatics Algorithms", MIT Press, 2005
 Gary Benson Roderic, "Algorithms in Bioinformatics", Springer, 2004

CO4			H	H	L

CSXX: Pattern Recognition & Visual Recognition

(3 credits - 45 hours)

Course Objective:

To help students understand basic mathematical and statistical techniques commonly used in pattern recognition. To introduce students to a variety of pattern recognition algorithms.

Course Outcomes

Understand basic mathematical and statistical techniques commonly used in pattern recognition. (Understanding)

Apply a variety of pattern recognition algorithms. (Applying)

Analyse and apply various pre-processing algorithms. (Analysing)

Evaluate various algorithms for image classification. (Evaluating)

Module 1 (8 hours)

Introduction and mathematical Preliminaries: Principles of pattern recognition: Uses, mathematics, Classification and Bayesian rules, Clustering vs classification, Basics of linear algebra and vector spaces, Eigen values and eigen vectors, Rank of matrix and SVD.

Module 2 (12 hours)

Pattern Recognition basics: Bayesian decision theory, Classifiers, Discriminant functions, Decision surfaces, Parameter estimation methods, Hidden Markov models, dimension reduction methods, Fisher discriminant analysis, Principal component analysis, non-parametric techniques for density estimation, non-metric methods for pattern classification, unsupervised learning, algorithms for clustering: K-means, Hierarchical and other methods

Module 3 (8 hours)

Feature Selection and extraction: Problem statement and uses, Branch and bound algorithm, Sequential forward and backward selection, Cauchy Schwartz inequality, Feature selection criteria function: Probabilistic separability based and Interclass distance based, Feature Extraction: principles

Module 4 (9 hours)

Visual Recognition: Human visual recognition system, Recognition methods: Low-level modelling (e.g. features), Mid-level abstraction (e.g. segmentation), High-level reasoning (e.g. scene understanding); Detection/Segmentation methods; Context and scenes, Importance and saliency, Large-scale search and recognition, Egocentric vision, systems, Human-in-the-loop interactive systems, 3D scene understanding.

Module 5 (8 hours)

Recent advancements in Pattern Recognition: Comparison between performance of classifiers, Basics of statistics, covariance and their properties, Data condensation, feature clustering, Data visualization, Probability density estimation, Visualization and Aggregation, FCM and soft-computing techniques, Examples of real-life datasets.

Suggested Readings:

Pattern Recognition and Machine Learning by Christopher M. Bishop, Springer, 2006.

Pattern Classification by Richard O. Duda, Peter E. Hart, David G. Stork, Wiley, 1973.

CO4		M			M

CSXXX: Genome Sequencing**(3 credits-45 hours)**

Course Objective:

The students should be able to understand the basic biology of modern genomics and the experimental tools those can be used to measure it.

Course outcomes: After completion of course, students would be able to:

Understand how data from next-generation sequencing experiments are generated and analyzed. (Understanding)

Understand Galaxy framework and apply for different types of analysis. (Applying)

Analyze RNA sequences using Galaxy framework. (Analysing)

Evaluate antibiotic sequence using genomic assembly tools. (Evaluate)

Module 1 (8 hours)

Introduction: Genomics, Genomic Data Science, Molecular Biology Structures, From Genes to Phenotypes, Polymerase Chain Reaction, Next Generation Sequencing, Applications of Sequencing, The String Reconstruction Problem, String Reconstruction as a Hamiltonian Path Problem, String Reconstruction as a Eulerian Path Problem.

Module 2 (12 hours)

Genomic data science with galaxy: Challenges of Reproducibility, Introduction to the Galaxy Platform, Genomic Intervals, Workflows, Sequence Data Quality Control, ChIP-Sequence Analysis with MACS, RNA-seq Analysis: Mapping, RNA Sequence Analysis: Assembly Quantitation, and Differential Expression.

Module 3 (8 hours)

Sequencing Antibiotics: Discovery of Antibiotics, How Do Bacteria Make Antibiotics, Sequencing Antibiotics by Shattering them into Pieces, A Brute Force Algorithm for Cyclopeptide Sequencing, Cyclopeptide Sequencing with Branch and Bound.

Module 4 (10 hours)

Ideal to Real Spectra for Antibiotics Sequencing: Adapting Sequencing for Spectra with Errors, from 20 to More than 100 Amino Acids, The Spectral Convolution, apply genome assembly tools to sequencing data from a dangerous pathogenic bacterium.

Module 5 (7 hours)

Proteomics: Protein structure, proteomics, and protein-protein interaction networks.

Suggested readings:

<https://www.coursera.org/learn/genome-sequencing#syllabus>

<https://www.coursera.org/learn/galaxyproject?specialization=genomic-data-science#syllabus>

Bioinformatics with Python Cookbook, Packt Publishing, 2015

Python for Bioinformatics, Sebastian Bassi, Chapman and Hall/CRC.

Alternative NPTEL/SWAYAM Course (if any):

CO4			H	H	L

CSXXX: Machine Learning with Python
(3 Credits - 45 hours)

Course Objective:

The students will be able to handle various datatypes and datasets in python. They will also be able to implement various machine learning model sin python.

Course Outcomes

Understand python and be able to handle various datasets in python.(Remembering, Understanding)

Understand basic machine learning algorithms.(Applying)

Apply different classification and clustering algorithms for problem solving.(Anaylsing)

Create basic machine learning algorithms in python.(Creating)

Module 1 (8 hours)

Introduction to Python: Data Types, Operators, Expression, Indexing & Slicing, Strings, Conditionals, Functions, Control Flow, Nested Loops, Sets & Dictionaries

Module 2 (12 hours)

Introduction to Machine Learning: Machine Learning Vs Statistical Modelling, Supervised vs Unsupervised Learning, Supervised Learning Classification, Unsupervised Learning, Reinforcement Learning, Applications, Python libraries suitable for Machine Learning: Pandas, Numpy, Scikit-learn, visualization libraries: matplotlib etc.

Module 3 (8 hours)

Regression: Simple Linear Regression, Multiple Linear Regression, Non-linear Regression, Model Evaluation in Regression Models, Evaluation Metrics in Regression Models

Module 4 (8 hours)

Classification: Introduction to Classification, K-Nearest Neighbour, Decision Trees, Logistic Regression, Support Vector Machines, Logistic regression vs Linear regression, Evaluation Metrics in Classification

Module 5 (9 hours)

Unsupervised Learning: Intro to Clustering, K-Means Clustering, Hierarchical Clustering, Density-Based Clustering, Content-based recommender systems, Collaborative Filtering

Laboratory/ Practicals:

Implementation of following machine learning algorithms in various projects using Python:

Classification and regression algorithms.

Artificial Neural Network (with back-propagation).

Mathematical computing with Python packages like: numpy, Mat-plotLib, pandas Tensor Flow, Keras

Implement basic ML models like SVM, KNN, K-Means, Logistic Regression, Linear Regression

Suggested Readings:

Hands-On Machine Learning with Scikit-Learn and TensorFlow 2e: Concepts, Tools, and Techniques to Build Intelligent Systems, Aurelien Geron, O'Reilly, 2017

Python Machine Learning - Third Edition, Sebastian Raschka, Vahid Mirjalili, Packt Publishers, 2019

Introduction to Machine Learning with Python: A Guide for Data Scientists 1st Edition by Andreas C. Müller, Sarah Guido, O'Reilly, 2016

CSXXX: AI for Everyone
(3 credits- 45 hours)

Course Objective:

The students should be able to understand what is AI, its applications and use cases and how it is transforming our lives.

Course outcomes:

Understand the basic concepts of AI and machine learning. (Remembering, understanding)

Understand the working of self-driving systems. (Applying)

Understand how to build different AI projects. (Evaluating and creating)

Apply AI techniques to any application domain. (Analysing)

Module 1: (10 hours)

Introduction: Machine Learning, What is data, The terminology of AI, What makes an AI company, What machine learning can and cannot do, Non-technical explanation of deep learning, basics of neural networks, Examples of AI, Application domains of AI.

Module 2: (10 hours)

Building AI projects: Workflow of a machine learning project, Workflow of a data science project, how to use data, How to choose an AI project, Working with an AI team, How to process and visualize data, Technical tools for AI teams, use of python in AI related projects.

Module 3: (8 hours)

Building AI in Your Company: Case study: Smart speaker, Case study: Self-driving car, Example roles of an AI team, AI pitfalls to avoid, Survey of major AI application areas

Module 4: (8 hours)

AI and Society: A realistic view of AI, Discrimination / Bias, Adversarial attacks on AI, Adverse uses of AI, AI and developing economies, AI and jobs

Module 5: (9 hours)

AI case studies related to a specific domain.

Laboratory/ Practicals:

Numerical type questions on CNN-

Parameters tuning

Convolution function

Different types of filters

Fuzzy Logic and Neural Networks

Implement self-driving vehicle algorithm.

CSXXX: SOFT COMPUTING LAB (1 Credit-15 hours)

Course Objective:

Students should be able to understand soft computing concepts and techniques and foster their abilities in designing and implementing soft computing-based solutions for real-world problems.

Course Outcomes:

Understand, Identify and describe soft computing techniques and their roles in building intelligent machines. (Remembering)

Apply a soft computing methodology for a particular problem. (Understanding)

Analyze and compare solutions by various soft computing approaches for a given problem. (Analyze)

Apply genetic algorithms to combinatorial optimization problems and develop solutions. (Applying)

Evaluate and compare solutions by various soft computing approaches for a given problem. (Evaluating)

Practical sessions: Setting up Python for Machine Learning and AI.

Experiments with TensorFlow for Neural Networks.

Experiments with scikit-fuzzy for Fuzzy Logic.

Implementing Fuzzy Logic in Python.

Implementing Artificial Neural Networks in Python.

CSXXX: Machine Learning for Data Science Lab (1 credit-15 hours)

Course Outcomes

Apply Clustering algorithms to solve any clustering problem. (Applying)
 Analyse the performance of various classification algorithms. (Analysing)
 Select appropriate models for solving a specific problem. (Evaluating)
 Design neural network-based classifiers to classify real world data. (Creating)

List of Experiments

Write a program to implement Linear Regression. Use an appropriate dataset to illustrate the working of linear regression.
 Write a program to implement Decision Tree. Illustrate the classification of sample data using an appropriate dataset.
 Write a program to demonstrate the classification of sample data using KNN algorithm.
 Write a program to implement Bayes Classifier for the classification of sample data.
 Write a program to implement logistic regression for the classification of sample data.
 Write a program to implement Support Vector Machine. Illustrate the classification of sample data using an appropriate dataset.
 Write a program to demonstrate the classification of sample data using Random Forest algorithm.
 Performance analysis of various classification methods using standard matrices applied on confusion matrix.
 Write a program to implement K-Means Clustering Algorithm.
 Write a program to implement a classifier using MLP. Use appropriate dataset to demonstrate the process of classification.
 Write a program to implement a sample CNN. Use appropriate dataset to test the performance of the classifier.
 Implement transfer learning using state of art CNN models. Use appropriate dataset to test the performances of such models.

CSXXX: Pattern Recognition & Visual Recognition Lab

(1 credit-15 hours)

Course Outcome

Implement various tools such as maximum likelihood algorithm, Bayes classifier, linear regression, deep learning algorithm, linear discriminant algorithm, unsupervised learning. (remembering, Applying)

Design classifier using perceptron rule, feed forward back-propagation and delta rule, SVM. (Creating)

List of Experiments

Basics of Data Extraction.

Basics of Feature extraction.

Basics of Image classification.

Implement maximum likelihood algorithm.

Implement Bayes classifier.

Implement linear regression.

Design a classifier using perceptron rule.

Design a classifier using feed-forward back-propagation and delta rule algorithms.

Implement deep learning algorithm.

Implement linear discriminant algorithm.

Design a two class classifier using SVM.

Design a multiclass classifier using SVM.

Perform unsupervised learning.

CSXXX: Capstone Project (Phase – I)

(6 Credits- 90 Hours)

Course Outcomes

Recall and identify the phases of the AI and ML project development lifecycle, including data collection, pre-processing, model selection, training, evaluation, and deployment. (Remembering)

Explain the significance of each phase in the AI and ML project lifecycle. Articulate how each phase contributes to the overall success of the project, from problem definition and data gathering to model evaluation and deployment. (Understanding)

Implement AI/ML systems using appropriate programming languages and frameworks. Develop a research plan for applying AI/ML techniques to solve real-world problems, considering scalability, efficiency, and ethical implications. (Applying)

Analyze and compare the feasibility of AI/ML projects in terms of time, effort, cost, and technical complexity. Assess risks and constraints associated with different project approaches and propose mitigating strategies. (Analyze)

Evaluate AI/ML projects based on criteria such as efficiency, applicability, robustness, user-friendliness, and socio-economic impact. Critically assess the success and limitations of implemented solutions and propose enhancements or alternatives. (Evaluating)

Design AI/ML applications by systematically examining and scientifically designing each phase of the project lifecycle. Integrate theoretical knowledge with practical implementation strategies to develop innovative and effective solutions. (Creating)

SEMESTER VIII

PE007: IMAGE AND VIDEO PROCESSING

(3 credits-45 Hours)

Course Objectives

The students will be able to work with images and videos in several ways. These methods can be used as pre-processing steps for complex models.

Course Outcomes

Understand images and videos representation in a detailed manner.
 Apply ML techniques for image processing in different scenarios.
 Apply various object detection and image segmentation algorithms.
 Apply various image restoration techniques and algorithms.

Module I: Image representation and analysis

Introduction to computer Vision, Numerical representation of images, Image augmentation, enhancement, processing, color transforms, geometric transforms, feature recognition and extraction

Module II: Image Segmentation

Object detection, breaking image into parts, finding contours and edges of various objects in image, Background subtraction for video.

Module III: Object Motion and tracking

Tracking a single point over time, motion models to define object movement over time, analyze videos as sequences of individual image frames, methods to track a set of features over time, matching features from image frame to other, tracking a moving car using optical flow

Module IV: Robotic localization

Bayesian statistics to locate a robot in space, sensor measurements to safely navigate an environment, Gaussian uncertainty, histogram filter for robot localization in python.

Module V: Image Restoration

Degradation model, noise models, estimation of degradation function by modeling, restoration using Wiener filters and Inverse filters

Suggested Readings/Textbooks

Audio Video Systems, Bali & Bali, Khanna Book Publishing 2020.
 Handbook of Image and Video Processing by Alan C. Bovik, Academic Press, 2000.
 Python 3 Image Processing, AshwinPajankar, BPB Publication, 2019.

PELAB007: IMAGE AND VIDEO PROCESSING LAB

(1 credit-15 Hours)

Course Objectives

The students will be able to work with images and videos in several ways. These methods can be used as pre-processing steps for complex models.

Course Outcomes

Understand images and videos representation in a detailed manner.
 Apply ML techniques for image processing in different scenarios.
 Apply various object detection and image segmentation algorithms.
 Apply various image restoration techniques and algorithms.

Laboratory Exercises

Various forms of image representation
 Apply various image segmentation algorithms
 Apply object motion and tracking
 Apply object localization
 Apply image restoration

PE008: DEEP LEARNING FOR COMPUTER VISION (3 credits-45 Hours)

Course Objectives

To help students understand advanced deep learning models for handling images. This course also helps students to generate synthetic datasets with the help of GANs.

Course Outcomes

Understand basic Computer Vision concepts.
 Apply complex deep learning models to real-life problems and datasets
 Create synthetic datasets with the help of GANs.
 Use of transfer learning for image classification.
 Use of LSTM for image captioning.

Module I: Convolutional Neural Networks

Introduction to Computer Vision, CNN architecture, Convolution function, CNN layers: Convolution, pooling and fully connected layers, activation functions, batch normalization, parameters and hyperparameters

Module II: Advanced CNN

Advances in CNN architecture, region-based CNN, faster CNN, standard CNN architectures: VGG, ResNet, Xception YOLO etc., transfer learning, Efficient CNN architecture: SqueezeNet

Module III: Recurrent Neural Network

RNN architecture, how RNN learns from ordered data sequences, RNN for sequential text generation, memory incorporation into deep learning models, applications of RNNs

Module IV: Attention Mechanisms and Image Captioning

how attention allows models to focus on a specific piece of input data, where attention is useful in natural language and computer vision applications, Combine CNN and RNN to build a complex captioning model, LSTM for caption generation.

Module V: Generative Adversarial Networks (GANs)

Introduction, Discriminator, Generator, Activation, Common activation functions for GANs, BCE loss, Conditional GANs, Controllable generation, real life GANs

Suggested Readings/Textbooks

Programming Computer Vision with Python: Techniques and Libraries for Imaging and Retrieving Information by Jan Erik Solem, O'Reilly, 2012

Deep Learning, Rajiv Chopra, Khanna Book Publishing, Delhi.

Hands-On Computer Vision with TensorFlow 2: Leverage deep learning to create powerful image processing apps with TensorFlow by Benjamin Planche, Eliot Andres, Packt Publishers, 2019

Learning Generative Adversarial Networks: Next-generation deep learning simplified by Kuntal Ganguly, Packt, 2017

PELAB008: DEEP LEARNING FOR COMPUTER VISION LAB

(1 credits-15 Hours)

Course Objectives

The students will be able to work with images and videos in several ways. These methods can be used as pre-processing steps for complex models.

Course Outcomes

Understand images and videos representation in a detailed manner.

Apply ML techniques for image processing in different scenarios.

Apply various object detection and image segmentation algorithms.

Apply various image restoration techniques and algorithms.

Laboratory Exercises

Apply basic CNN for image classification

Apply transfer learning with the help of advanced CNN for image classification

Apply Recurrent Neural Networks

LSTM for image captioning

Use of GANs for generating synthetic datasets

Mapping of COs to Syllabus

PE012: ALGORITHMS FOR DNA SEQUENCING**(3 credits-45 Hours)****Course Objectives**

The students should be able to understand computational methods, algorithms and data structures for analyzing DNA sequencing data.

Course Outcomes

Understand DNA sequences, genomics, and how DNA sequencing is used.

Apply python to implement key algorithms and data structures to analyze real genomes and DNA sequencing datasets.

Understand human population genomics.

Analyze genome sequence of different species.

Module I: DNA sequencing, strings and matching

DNA sequencing past and present, Genomes as strings, reads as substrings, String definitions and Python examples, How DNA gets copied, Sequencing reads in FASTQ format, Sequencers give pieces to genomic puzzles, Read alignment and why it's hard, Naive exact matching

Module II: Pre-processing, indexing and approximate matching

Boyer-Moore basics, Diversion: Repetitive elements, Pre-processing, Indexing and the k-mer index, ordered structures for indexing, hash tables for indexing, Variations on k-mer indexes, Genome indexes used in research, Approximate matching, Hamming and edit distance, Pigeonhole principle.

Module III: Edit distance, assembly, overlaps

Solving the edit distance problem, using dynamic programming for edit distance, a new solution to approximate matching, Meet the family: global and local alignment, read alignment in the field, Assembly: working from scratch, First and second laws of assembly, Overlap graphs.

Module IV: Algorithms for assembly

The shortest common superstring problem, Greedy shortest common superstring, Third law of assembly: repeats are bad, De Bruijn graphs and Eulerian walks, When Eulerian walks go wrong,

Module V: Assemblers in practice

Assemble a genome from small pieces of DNA, comparing genomes of different species, gene finding, gene regulation, Cancer Sequencing, Fragment Assembly, Human Population Genomics

PELAB012: ALGORITHMS FOR DNA SEQUENCING LAB**(1 credits-15 Hours)****Course Objectives**

The students should be able to understand computational methods, algorithms and data structures for analyzing DNA sequencing data.

Course Outcomes

Understand DNA sequences, genomics, and how DNA sequencing is used.

Apply python to implement key algorithms and data structures to analyze real genomes and DNA sequencing datasets.

Understand human population genomics.

Analyze genome sequence of different species.

Laboratory Exercises

Convert a given sequence of DNA into its Protein equivalent.

De-Coding a Human DNA Sequence using Python.

Implement DNA alignment using Python.

Implement assembly algorithms for DNA.

Write a program for comparing genomes of different species.

PE013: COMPUTATIONAL NEUROSCIENCE**(3 credits-45 Hours)****Course Objectives**

The students should be able to explore the computational principles governing various aspects of vision, sensory-motor control, learning, and memory. They should learn representation of information by spiking neurons, processing of information in neural networks, and algorithms for adaptation and learning.

Course Outcomes

Understand how the brain processes information.

Understand the mathematical and computational models used in neuroscience.

Analyze different neural encoding models using python.

Apply supervised learning to neuron classifiers.

Module I: Introduction & Basic Neurobiology

Computational Neuroscience: Descriptive Models, Computational Neuroscience: Mechanistic and Interpretive Models, The Electrical Personality of Neurons, Making Connections: Synapses, Time to Network: Brain Areas and their Function.

Module II: Neural Encoding Models

Neural Encoding: Simple Models, Feature Selection, Variability, Vectors and Functions, Convolutions and Linear Systems, Change of Basis and PCA.

Module III: Extracting Information from Neurons & Neural coding

Neural Decoding and Signal Detection Theory, Population Coding and Bayesian Estimation, Reading Minds: Stimulus Reconstruction, Information and Entropy, Calculating Information in Spike Trains, Coding Principles.

Module IV: Computing in Carbon and Computing with Networks

Modeling Neurons, Spikes, Simplified Model Neurons, A Forest of Dendrites, modeling Connections Between Neurons, Introduction to Network Models, The Fascinating World of Recurrent Networks.

Module 5: Plasticity in the Brain & Learning

Synaptic Plasticity, Hebb's Rule, and Statistical Learning, Introduction to Unsupervised Learning, Sparse Coding and Predictive Coding

Learning from Supervision and Rewards

Neurons as Classifiers and Supervised Learning, Reinforcement Learning: Predicting Rewards, Reinforcement Learning: Time for Action

Introduction to AI & Machine Learning**Credit: 3, Hours: 45****Course Objective:**

To review and strengthen important mathematical concepts required for AI & ML.

Introduce the concept of learning patterns from data and develop a strong theoretical foundation for understanding state-of-the-art Machine Learning algorithms.

Course Outcomes: After completion of the course, students would be able to:

Design and implement machine learning solutions to classification, regression, and clustering problems.

Evaluate and interpret the results of the different ML techniques.

Design and implement various machine learning algorithms in a range of Real-world

Course Contents: [Total Theory Duration: 45Hours]**Module 1:**(12 Hours)

Defining Artificial Intelligence, Defining AI techniques, Using Predicate Logic and Representing Knowledge as Rules, Representing simple facts in logic, Computable functions and predicates, Procedural vs Declarative knowledge, Logic Programming, Mathematical foundations: Matrix Theory and Statistics for Machine Learning.

Module 2:(10Hours)

Idea of Machine learning from data, Classification of problem –Regression and Classification, Supervised and Unsupervised learning.

Module 3:(10 Hours)

Linear Regression: Model representation for single variable, Single variable Cost Function, Gradient Descent for Linear Regression, Gradient Descent in practice.

Module 4:(8Hours)

Logistic Regression: Classification, Hypothesis Representation, Decision Boundary, Cost function, Advanced Optimization, Multi-classification (One vs All), Problem of Overfitting.

Module 5:(5 Hours)

Discussion on clustering algorithms and use-cases centered around clustering and classification.

CO-Module Mapping Table

	Module 1	Module 2	Module 3	Module 4	Module 5

Introduction to AI & Machine Learning Lab

Credit: 1, Hours: 15

List of Experiments:

Implementation of logical rules in Python.

Using any data, apply the concept of: (a) Linear regression (b) Gradient descent (c) Logistic regression

To add the missing value in any data set.

Perform and plot underfitting and overfitting in a data set.

Implementation of clustering and classification algorithms.

LIST of VALUE-ADDED COURSES offered by the DEPARTMENT

1. Computer Aided Drafting
2. Building Modeling and Analysis using STAAD-Pro

3. Training on Modeling and Analysis using ABACUS
4. Detailing and Drafting of Concrete Reinforcement
5. Soil modelling with the finite element program PLAXIS 2D (INTRODUCED in AUTUMN 2023)

DEPARTMENT OF CIVIL ENGINEERING

VISION

To be a recognized leader in Civil Engineering education and learning experiences providing state of the art education guided by innovative research and consultancy, inclusive technology and managerial skills for industry as well as societal needs towards sustainable development.

MISSION

To make the department a center of excellence in Civil Engineering education which equips students with a strong conceptual foundation coupled with practical insight to meet the global industrial and environmental challenges.

To produce spiritually inspired socially committed and intellectually competent professionals of high caliber and strong ethical principles to serve the society and nation through teamwork and societal leadership.

To establish the department as a recognized center of research for developing sustainable solutions to engineering problems by providing knowledge base and consultancy services to the community.

PROGRAM EDUCATIONAL OBJECTIVES (PEOS)

1. To equip the students with necessary technical skills and professional expertise that make them competent for immediate employment or to pursue postgraduate studies in Civil Engineering disciplines.
2. To produce graduates who are spiritually motivated for life-long learning and morally committed for successful careers as civil engineers, managers, administrators, educators, engineering consultants and entrepreneurs.
3. To enhance students' abilities to identify and take up project and research topics which would be highly useful for the society considering the present environmental and industrial needs of the country.
4. To make the students able to communicate their innovative ideas to be effective in collaboration with other civil engineering teams that will make them achieve leadership positions to solve different challenges of civil engineering problems.
5. To develop a sense of understanding of the multidisciplinary approach and an ability to relate engineering issues to the broader context of individuals and society for sustainable development.

DETAILED SYLLABUS (Theory Courses)

CVMI187T :Materials in Civil Engineering

3 Credits - 3L:0T:0P

Objectives:

The course aims to provide students with a deep understanding of the properties, behaviors, and applications of various construction materials used in civil engineering projects. It equips students with the knowledge to select appropriate materials and design solutions that ensure durability, sustainability, and cost-effectiveness in civil engineering practices.

Course outcomes

CO1. Explain the properties and requirements of all building materials. (Understanding)

CO2. Identify various components of buildings and their functions. (understanding)

CO3. Judge the quality of building materials (Evaluate)

Syllabus:

Module I:10 Hours

Role of materials in construction; Aggregate: Classification, Physical and mechanical properties, soundness, alkali-aggregate reaction, thermal properties of aggregate Bricks and Masonry Blocks: Types, properties and field and laboratory tests to evaluate quality Lime: classification, properties Cement: types, Portland cement: chemical composition of raw material, bogue compounds, hydration of cement, role of water in hydration, testing of cements, fly ash: properties and use in manufacturing of bricks and cement. Building stone: classifications, properties and structural requirements; Masonry- Materials, Walls, Resistance, Functional Performances, Defects and Durability,

Module II :15 Hours

Mortar: Types and tests on mortars. Concrete: Production, mix proportions and grades of concrete, fresh, mechanical and durability properties of concrete, factors affecting properties of concrete, tests on concrete, admixtures, Special concrete: light weight concrete, high density concrete, vacuum concrete, shotcrete, steel fiber reinforced concrete, polymer concrete, Ferro cement, high performance concrete, self-compacting concrete.

Module III: 15 Hours

Wood and Wood products: Introduction to wood macrostructure, sap wood and heart wood, defects and decay of timber, seasoning and preservation of timber, fire resisting treatment, introduction to wood products- veneers, plywoods, fibre board, particle board, block board, batten boards. Metals: Steel: Important properties and uses of Iron (Cast iron, wrought iron and steel), Important tests on steel rebar, aluminum and copper. Glass: types and uses, gypsum: source, properties, uses; plastic: properties and uses, paint: types, distemper, varnish, Adhesive: Types, Bitumen: types, properties and tests.

Suggested readings:

CVIT188T :Introduction to Construction Techniques & Material Testing

2 Credits: 2L: 0T:0P

Objectives:

Objectives of the course is to make students aware of the various construction techniques, practices and the equipment needed for different types of construction projects.

Course Outcomes:

After successful completion of the course, students will be able to:

CO1. Explain various construction procedures for sub to super structure (Understanding)

CO2. Identify and recommend suitable equipment needed for construction of various types of structures from foundation to super structure (Understanding)

CO3. Testing of Various Construction materials (Applying)

Syllabus:

Module I: [6 Hours]

Construction Techniques: Structural systems- Load bearing structures-Framed structure- Load bearing mechanism-Floor system- development of construction techniques-High rise building technology- seismic effect- Environmental Impact Materials.

Green building-materials used – construction methods-Natural Buildings- passive buildings-Intelligent building / smart buildings-Building automation- Energy efficient building for various zones. Case Studies

Module II: [8 Hours]

Construction Practices: Specifications -Details and sequence of activities and construction coordination-Site clearance-marking- earthwork, masonry, stone masonry-bonds in masonry- concrete- hollow block masonry-

flooring- damp proof course-construction joints-building foundations- Basements -Scaffolding- Dethuttering forms-Fabrication and erection of steel trusses -weather and water proof roof finishes-Acoustic and Fire protection

Module III: [6 hours]

Sub Structure Construction: Techniques of box jacking , pipe jacking- Under water construction of diaphragm walls and basement – Tunnelling techniques-Piling Techniques-Well and Caisson-Sinking Cofferdams-Cable Anchoring and grouting-driving diaphragm walls -sheet piles – shoring for deep cuttings-well points- Dewatering-standby plant equipment for underground open excavation.

Module IV: [5 hours]

Superstructure Construction: Launching girders- bridge deck- Offshore Platform-Material handling- erecting light weight components of tall structures-Support structures for heavy equipment and Conveyors.

Module V: [5 Hours]

Construction Equipment: Selection of Equipment for earthwork-Earth moving operations-types of earthwork equipment-equipment for foundations and pile driving-equipment for compaction, batching- mixing and concreting, Equipment for material handling, erection of structures -Types of cranes , equipment for dredging, trenching and tunnelling.

CVSW189T: Survey work

1 credits:1L:0T:0P

Course Objectives:

The course aims to equip students with the skills and knowledge necessary for conducting accurate and efficient land surveys, including the use of modern surveying instruments and techniques. It focuses on providing practical experience and understanding of data collection, analysis, and interpretation to support various civil engineering and construction projects.

After successful completion of this lab course Students will be able to :

CO1. Demonstrate ability to use surveying equipment and techniques to collect data for civil engineering projects. (Understanding)

CO2. Develop effective strategies and plans for executing civil engineering field studies and surveying. (Applying)

CO3. Apply mathematical principles analyse data collected during field activities for problem solving in civil engineering projects. (Applying)

Syllabus:

Module I: [5 Hours]

Surveying: - Introduction, History and principles of chain survey, Instruments Classification, accuracy, types, Main divisions (plane & geodetic), Chaining, , Compass survey, Plane table survey.

Module II [5 Hours]

Levelling: -Auto level, dumpy Level, Tilting Level, Principle of levelling Types, component/part and function, Datum Focussing and parallax, Deduction of levels / Reduced Level, Types of levelling, Application to chain and Levelling Instrument to Building construction.

Module III: [5 Hours]

Contouring: Definition, Characteristics, Methods, Interpolation of Contour, Contour gradient, Uses of Contour plan and Map. Introduction to Theodolite survey and Total station.

CVSW191P: Survey work Lab

List of Practical

Chain Surveying- Open Traverse and Closed Traverse
Plotting
Compass Surveying
Levelling
Preparation of contour maps
Theodolite Surveying

CVMS204T: Mechanics of Solids

B.Tech-CVE 3

3 credits- (3L: 0T :0P)

Course Objectives

The objective of this Course is to introduce continuum mechanics and material modelling of engineering materials based on first energy principles: deformation and strain; momentum balance, stress and stress states; elasticity and elasticity bounds; plasticity and yield design.

Course Outcomes:

On completion of the course, the student will be able to:

CO1: Apply the principles of equilibrium, superposition, and compatibility to estimate the stress-strain behaviour of linear elastic solids under axial and torsional loading. (Understanding)

CO2: Analyse stresses at inclined planes and construct Mohr's circle to predict the principal and maximum shear planes and apply the theories of failure (Applying)

CO3: Construct shear force and bending moment diagrams, to estimate the deflection and stress distribution in beams of various cross sections (Applying)

CO4: Determine longitudinal and circumferential stresses in thin and thick cylinders subjected to internal and external pressures (Applying)

Syllabus

Module1:[7 Hours]

Simple Stresses and Strains- Concept of stress and strain, St. Venant's principle, stress and strain diagram, Elasticity and plasticity – Types of stresses and strains, Hooke's law – stress – strain diagram for mild steel – Working stress – Factor of safety – Lateral strain, Poisson's ratio and volumetric strain – Elastic moduli and the relationship between them – Bars of varying section – composite bars – Temperature stresses. Strain Energy – Resilience – Gradual, sudden, impact and shock loadings – simple applications.

Module 2:[8 Hours]

Compound Stresses and Strains- Two-dimensional system, stress at a point on a plane, principal stresses and principal planes, Mohr circle of stress, ellipse of stress and their applications. Two-dimensional stress-strain system, principal strains and principal axis of strain, circle of strain and ellipse of strain. Relationship between elastic constants.

Module 3:[10 Hours]

Bending moment and Shear Force Diagrams- Bending moment (BM) and shear force (SF) diagrams. BM and SF diagrams for cantilevers simply supported and fixed beams with or without overhangs. Calculation of maximum BM and SF and the point of contra flexure under concentrated loads, uniformly distributed loads over the whole span or part of span, combination of concentrated loads (two or three) and uniformly distributed loads, uniformly varying loads, application of moments.

Module 4: [5 Hours]

Flexural Stresses-Theory of simple bending – Assumptions – Derivation of bending equation: $M/I = f/y = E/R$ - Neutral axis – Determination of bending stresses – Section modulus of rectangular and circular sections (Solid and Hollow), I, T, Angle and Channel sections – Design of simple beam sections.

Module 5: [5 Hours]

Shear Stresses- Derivation of formula – Shear stress distribution across various beam sections like rectangular, circular, triangular, I, T angle sections.

Module 6: [6 Hours]

Slope and deflection- Relationship between moment, slope and deflection, Moment area method, Macaulay's method. Use of these methods to calculate slope and deflection for determinant beams.

Module 7: [4 Hours]

Torsion- Derivation of torsion equation and its assumptions. Applications of the equation of the hollow and solid circular shafts, torsional rigidity, Combined torsion and bending of circular shafts, principal stress and maximum shear stresses under combined loading of bending and torsion. Analysis of close-coiled-helical springs. Thin Cylinders and Spheres- Derivation of formulae and calculations of hoop stress, longitudinal stress in a cylinder, and sphere subjected to internal pressures.

CVCE206T :CIVIL ENGINEERING MATERIALS AND CONCRETE TECHNOLOGY

B.Tech-CVE 3

3 Credits (3L:0T:0P)

Objective:

The main goal of this course is to provide students with all information concerning principle, evaluation, as well as practical application of civil engineering materials.

To acquaint the students for exploring the materials, its properties, intrinsic nature and its application in preparing cement concrete.

To understand the influence of various factors effecting the strength and durability of Concrete.

To illustrate the concrete mix design process based on properties of material as per various national and international standards.

To understand the basic behavior of concrete or other engineering materials under application of various loading conditions and surrounding environment.

Exposure to a variety of established engineering materials.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

Examine the properties of basic building materials like, stones, bricks, cement and concrete. (Understanding)

Design concrete mixes using principles and methods of mix design. (Creating)

Articulate the applications of special concrete and other engineering materials. (Applying)

Syllabus:

Module I (10 hours)

Building stone: classifications, properties and structural requirements; Stone Masonry: General principles, classification of stone masonry and their relative merits and demerits.

Bricks: Types, properties and field and laboratory tests to evaluate quality; Brick Masonry: types of bonds, relative merits and demerits of English, Single Flemish and Double Flemish bond.

Module II (10 hours)

Concrete and its Ingredients: Introduction and historical background of concrete; Cement: manufacturing process, chemical composition, Heat of hydration and Structure of hydrated cement, Physical tests of cement, Supplementary cementitious material; Aggregate: Categorization of aggregate and its Properties, Grading and Testing of Aggregates; Admixtures: Review of Types and Classification, Chemical Composition, Effects on Properties of Concretes; Water: General requirements and impurities in water.

Module III (10 hours)

Fresh and Hardened Concrete: Fresh concrete: Properties of fresh concrete, Workability tests as per IS standards, factors affecting workability, Segregation & Bleeding, Slump loss, Retempering, Mixing, transporting, Placing, Compaction and Curing of concrete; Hardened concrete: Various tests on Hardened concrete; Destructive test: Compressive, Flexure, Tensile and Bond tests. Introduction to Non-Destructive and semi-destructive testing using Rebound Hammer, Ultrasonic pulse velocity and core cutting tests.

Module IV (10 hours)

Mix design, Durability & Permeability of Concrete: Principles of concrete mix design, parameters and factors influencing mix design, Indian Standard methods of mix design, Acceptability criteria, Variability of results, , Factors affecting durability, Types of Cracking & causes; Alkali-aggregate reaction, Degradation by freeze & thaw, Sulphate attack, Durability under sea-water.

Module V (5 hours)

Other Engineering Materials: Special concrete, Ceramics, and Refractories, Bitumen and asphaltic materials, Timbers, Glass and Plastics; Steel: Types of Steel, Properties of Rolled section and Bars; Paints and Varnishes, Acoustical material and geo-textiles, rubber and asbestos, laminates and adhesives, Composite materials and FRP.

CVFM207T :FLUID MECHANICS**B.Tech-CVE 3****3 Credits: (3L: 0T:0P)****Objectives**

- To introduce the concepts of fluid mechanics useful in Civil Engineering applications.
- To understand the properties of fluids and fluid statics.
- To derive the equation of conservation of mass and its application
- To solve kinematic problems such as finding particle paths and stream lines
- To use important concepts like continuity equation and Bernoulli's equation and apply the same to solve fluid flow problems
- To understand the various flow measuring devices.

Course/ Learning Outcomes

At the end of this course students will be able to:

- CO1.** Define the basic terms used in fluid mechanics. (*remember*)
CO2. Explain the broad principles of fluid statics, kinematics and dynamics. (*understand*)
CO3. Classify different types of fluid flow. (*understand*)
CO4. Solve problems using the continuity, momentum and energy principles. (*apply*)
CO5. Test various scenarios using dimensional analysis. (*analyze*)

Module I (5 hours)

Basic Concepts and Definitions – Distinction between a fluid and a solid; Density, Specific weight, Specific gravity, Kinematic and dynamic viscosity; variation of viscosity with temperature, Newton law of viscosity; vapor pressure, boiling point, cavitation; surface tension, capillarity, Bulk modulus of elasticity, compressibility.

Module II (11 hours)

Fluid Statics - Fluid Pressure: Pressure at a point, Pascals law, pressure variation with temperature, density and altitude. Piezometer, U-Tube Manometer, Single Column Manometer, U-Tube Differential Manometer, Micromanometers. pressure gauges, Hydrostatic pressure and force: horizontal, vertical and inclined surfaces. Buoyancy and stability of floating bodies.

Module III (11 hours)

Fluid Kinematics- Classification of fluid flow: steady and unsteady flow; uniform and non-uniform flow; laminar and turbulent flow; rotational and irrotational flow; compressible and incompressible flow; ideal and real fluid flow; one-, two- and three-dimensional flows; Stream line, path line, streak line and stream tube; stream function, velocity potential function. One-, two- and three -dimensional continuity equations in Cartesian coordinates.

Module IV (13 hours)

Fluid Dynamics- Surface and body forces; Equations of motion - Euler's equation; Bernoulli's equation – derivation; Energy Principle; Practical applications of Bernoulli's equation: venturimeter, orifice meter and pitot tube; Momentum principle; Forces exerted by fluid flow on pipe bend; Vortex Flow – Free and Forced.

Module V (5 hours)

Dimensional Analysis and Dynamic Similitude – Rayleigh's method; Buckingham's π -Theorem; Definitions of Reynolds Number, Froude Number, Mach Number, Weber Number and Euler Number.

CVTE221T : Transportation Engineering

B TECH -CVE 4

3 Credits: 3L:0T:0P -

Objective: *This course introduces Transportation Engineering, a core civil engineering practice in the field with prime focus on the highway engineering sector. On completion a student should be competent enough for planning and designing of different types of roads with necessary quality control in road construction and maintenance.*

On completion of the course, the students will be able to:

CO1: Carry out surveys involved in planning and highway alignment (Applying)

CO2: Design the geometric elements of highways and expressways (Creating)

CO3: Carry out traffic studies and implement traffic regulation and control measures and intersection design (Applying)

CO4: Characterize pavement materials and design flexible and rigid pavements as per IRC (Understanding)

Syllabus

Module 1: (5 Hours)

Highway development and planning-Classification of roads, road development in India, Current Road projects in India; highway alignment and project preparation.

Module 2:(10 Hours)

Geometric design of highways:- Introduction; highway cross section elements; sight distance, design of horizontal alignment; design of vertical alignment; design of intersections, problems.

Module 3:(10 Hours)

Accessibility to Differently Abled Publics

Design of Access Routes & Walkways (Elements of walkways, Tactile Navigation Systems, BRT Systems, Pedestrian streets and other related aspects), Accessible Streets and Mobility Environments (Street Elements for Accessibility, dimensions and codes material, TGSIs), Inclusive Public Transportation System

Module 4:(5 Hours)

Traffic engineering & control- Traffic Characteristics, traffic engineering studies, traffic flow and capacity, traffic regulation and control; design of road intersections; design of parking facilities; highway lighting; problems

Module 5:(5 Hours)

Pavement materials- Materials used in Highway Construction- Soils, Stone aggregates, bituminous binders, bituminous paving mixes; Portland cement and cement concrete: desirable properties, tests, requirements for different types of pavements. Problems

Module 6:(10 Hours)

Design of pavements- Introduction; flexible pavements, factors affecting design and performance; stresses in flexible pavements; design of flexible pavements as per IRC; rigid pavements- components and functions; factors affecting design and performance of CC pavements; stresses in rigid pavements; design of concrete pavements as per IRC; problems

CVSA222T:SURVEYING AND GEOMATICS

3 credits- (L:T:P:3:0:0)

Objectives: Objectives of this course is to introduce the students to various types of surveying and to prepare them to work with survey observations and perform calculations.

COURSE/LEARNING OUTCOMES

On completion of the course the students will be able to:

CO1. Classify different types of surveying and their applicability. (Understanding)

CO2. Recognize the importance and uses of remote sensing and other modern techniques in various civil engineering works. (Understanding)

CO3. Execute traverse calculations; determine latitudes, departures, and coordinates of control points and balancing errors in a traverse. Use appropriate software for calculations and mapping. (Applying)

CO4. Operate the techniques, skills, and applicable tools of the discipline for application in engineering and surveying activities. (creating)

Detailed Syllabus

Module I: Introduction to Surveying (15 hours):

Principles, Linear, angular and graphical methods, Survey stations, Survey lines use.

Chain Surveying: Definition, advantages, and disadvantages, Advantages of chain surveying, Disadvantages of chain surveying, Equipment required for chaining, Process of chain surveying, Chain survey stations, Line Types in Chain Survey, Ranging, Offsets in chain survey, Correction for Chain and Tape Measurement.

Compass Surveying: Definition, Priorities for compass surveying, Methods of Angle Measurement, Definitions used in Angular Measurements, Principle of Compass Surveying, Types of Bearing, Types of Compasses (Angular Measurement Equipment), Fore Bearing and Back Bearing, Local attraction, Elimination of Local Attraction in Compass Surveying.

Levelling Survey: Levelling and Objectives of Levelling, Terms Related to Levelling, Applications of Levelling in Surveying, Types of Levels Used in Levelling, Basic Components of a Dumpy Level, Temporary and permanent Adjustment of Levelling, Types of Levelling in Surveying, Curvature and Refraction Correction, Errors in Levelling, Methods of Calculation of Reduced Level, Difficulties faced in levelling.

Theodolite Survey: Uses and types of theodolite, parts of theodolite, Temporary Adjustment of a Theodolite, Measurement of Horizontal Angles, Measurement of Vertical Angles, Measurement of Deflection Angle, Measurement of Magnetic Bearing of a Line, Theodolite Traverse Survey Calculation, Trigonometric Surveying: Measurement of Height and Distance.

Contouring: Contour Line and Contour Interval, Characteristics of a Contour, Methods of Contour Surveying, Interpolation of Contours, Uses of Contour Lines/Maps.

Plane Table Surveying: Objectives and principles of plane table survey, Equipment Used in Plane Table Survey, Temporary Adjustments of the Plane Table, Methods of Plane Table Surveying, Advantages and Disadvantages of Plane Table Surveying, Errors in Plane Table Surveying.

Computation of Area and Volume: Trapezoidal method, Simpson's rule, Area of regular shapes, Computation of Volume.

Module II: Triangulation and Trilateration (7 Hours):

Theodolite survey: Instruments, Measurement of horizontal and vertical angle; Horizontal and vertical control - methods -triangulation – network- Signals. Baseline - choices - instruments and accessories - extension of

base lines – corrections - Satellite station - reduction to centre - Intervisibility of height and distances – Trigonometric leveling - Axis single corrections.

Module III: Curves (7 hours)

Elements of simple and compound curves – Method of setting out– Elements of Reverse curve - Transition curve – length of curve – Elements of transition curve - Vertical curves

Module IV: Modern Field Survey Systems (7 Hours):

Principle of Electronic Distance Measurement, Modulation, Types of EDM instruments, Distomat, Total Station – Parts of a Total Station – Accessories –Advantages and Applications, Field Procedure for total station survey, Errors in Total Station Survey; Global Positioning Systems- Segments, GPS measurements, errors and biases, Surveying with GPS, Co-ordinate transformation, accuracy considerations.

Module V: Photogrammetry Surveying (6 Hours):

Introduction, Basic concepts, perspective geometry of aerial photograph, relief and tilt displacements, terrestrial photogrammetry, flight planning; Stereoscopy, ground control extension for photographic mapping- aerial triangulation, radial triangulation, methods; photographic mapping- mapping using paper prints, mapping using stereo plotting instruments, mosaics, map substitutes.

Module VI: Remote Sensing (3 Hours):

Introduction –Electromagnetic Spectrum, interaction of electromagnetic radiation with the atmosphere and earth surface, remote sensing data acquisition: platforms and sensors; visual image interpretation; digital image processing.

Suggested Readings:

1. Madhu, N, Sathikumar, R and Satheesh Gobi, Advanced Surveying: Total Station, GIS and Remote Sensing, Pearson India, 2006.

CVGE223T : Geotechnical Engineering

(3 credits – 45 hours) (3L:0T:0P)

Objectives

This course aims to impart a solid foundation in the principles of Soil Mechanics, equipping students with a comprehensive understanding of the subject. It provides in-depth knowledge about the fundamental properties of soils, including basic, index and engineering properties, enabling students to analyze and apply this information effectively in practical engineering scenarios.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

CO1. Classify the soils. (Understanding)

CO2. Determine seepage, stresses under various loading conditions and compaction characteristics. (Applying)

CO3. Analyze the compressibility of soils. (Analyzing)

CO4. Evaluate soil strength under various drainage conditions. (Evaluating)

CO5. Design and assess the stability of embankment slopes. (Creating)

Module I: 8 Hours

Basic Concepts: Types of soils, their formation and deposition, Definitions: soil mechanics, soil engineering, rock mechanics, geotechnical engineering. Scope of soil engineering. Comparison and difference between soil and rock, Soil as three-phase system.

Index Properties: Plasticity Characteristics of Soil - Introduction to definitions of: plasticity of soil, consistency limits-liquid limit, plastic limit, shrinkage limit, plasticity, liquidity and consistency indices, flow & toughness indices, definitions of activity and sensitivity. Determination of: liquid limit, plastic limit and shrinkage limit. Use of consistency limits. Classification of Soils-Introduction of soil classification: particle size classification, textural classification, unified soil classification system, Indian standard soil classification system. Identification: field identification of soils, general characteristics of soil in different groups.

Module II: 8 Hours

Permeability of Soil: Darcy's law, validity of Darcy's law. Determination of coefficient of permeability: Laboratory method: constant-head method, falling-head method. Field method: pumping- in test, pumping- out test. Permeability aspects: permeability of stratified soils, factors affecting permeability of soil. Seepage Analysis- Introduction, stream and potential functions, characteristics of flow nets, graphical method to plot flow nets.

Effective Stress Principle: Introduction, effective stress principle, nature of effective stress, effect of water table. Fluctuations of effective stress, effective stress in soils saturated by capillary action, seepage pressure, quick sand condition.

Module III: 8 Hours

Stresses in soils: Introduction, stresses due to point load, line load, strip load, uniformly loaded circular area, rectangular loaded area. Influence factors, Isobars, Boussinesq's equation, Newmark's Influence Chart. Contact pressure under rigid and flexible area, computation of displacements from elastic theory.

Compaction of Soil: Introduction, theory of compaction, laboratory determination of optimum moisture content and maximum dry density. Compaction in field, compaction specifications and field control.

Module IV: 8 Hours

Consolidation of Soil: Introduction, comparison between compaction and consolidation, initial, primary & secondary consolidation, spring analogy for primary consolidation, interpretation of consolidation test results, Terzaghi's theory of consolidation, final settlement of soil deposits, computation of consolidation settlement and secondary consolidation

Module V: 8 Hours

Shear Strength: Mohr circle and its characteristics, principal planes, relation between major and minor principal stresses, Mohr-Coulomb theory, types of shear tests: direct shear test, merits of direct shear test, triaxial compression tests, test behaviour of UU, CU and CD tests, pore-pressure measurement, computation of effective shear strength parameters. unconfined compression test, vane shear test.

Module VI: 5 Hours

Stability of Slopes: Introduction, types of slopes and their failure mechanisms, factor of safety, analysis of finite and infinite slopes, wedge failure Swedish circle method, friction circle method, stability numbers and charts.

Suggested Readings:

1. Soil Mechanics by Craig R.F., Chapman & Hall
2. Elements of Land/ Soil Pollution by O.P. Gupta, Khanna Book Publishing.
3. Fundamentals of Soil Engineering by Taylor, John Wiley & Sons
4. An Introduction to Geotechnical Engineering, by Holtz R.D. and Kovacs, W.D., Prentice Hall, NJ
5. Principles of Geotechnical Engineering, by Braja M. Das, Cengage Learning

6. Principles of Foundation Engineering, by Braja M. Das, Cengage Learning
7. Essentials of Soil Mechanics and Foundations: Basic Geotechnics by David F. McCarthy
8. Soil Mechanics in Engineering Practice by Karl Terzaghi, Ralph B. Peck, and Gholamreza Mesri.
9. Geotechnical Engineering: Principles and Practices of Soil Mechanics and Foundation Engineering (Civil and Environmental Engineering) by V.N.S. Murthy

CVHE224T :HYDRAULIC ENGINEERING**B TECH CVE 4****(3 Credits) (3L: 0T:0P)****Objectives**

- To relate the theory and practice of problems in hydraulic engineering.
- To introduce the concepts of laminar and turbulent pipe flows.
- To understand the various losses in pipe flows.
- To investigate the formation of boundary layer over flat plates.
- To comprehend the physics of open channel flows.
- To distinguish uniform open channel flows from non-uniform open channel flows.

Course/ Learning Outcomes**At the end of this course students will be able to:****CO1.** Differentiate between laminar and turbulent pipe flow theories. (analyze)**CO2.** Solve pipe flow problems for branching pipes and pipe network. (apply)**CO3.** Recognize and solve the boundary layer problems. (understand, apply)**CO4.** Test their knowledge of fluid mechanics to address the uniform flow problems in open channels. (analyze)**CO5.** Investigate the problems of gradually and rapidly varied flows in open channels under steady state conditions. (create)**Module I (10 hours)****Laminar Flow** - Laminar flow through: circular pipes, annulus and parallel plates. Stoke's law, Measurement of viscosity.**Turbulent Flow**- Reynolds experiment, Transition from laminar to turbulent flow. Definition of turbulence, scale and intensity, Causes of turbulence, instability, mechanism of turbulence and effect of turbulent flow in pipes. Reynolds stresses, semiempirical theories of turbulence, Prandtl's mixing length theory, universal velocity distribution equation. Resistance to flow of fluid in smooth and rough pipes, Moody's diagram.**Module II (7 hours)**

Loss of head through pipes, Darcy-Wiesbatch equation, minor losses, total energy equation, hydraulic gradient line, Pipes in series, equivalent pipes, pipes in parallel, flow through laterals, flows in dead end pipes, siphon, power transmission through pipes, nozzles. Analysis of pipe networks: Hardy Cross method, water hammer in pipes and control measures, branching of pipes, three reservoir problem.

Module III (10 hours)

Assumption and concept of boundary layer theory. Boundary-layer thickness, displacement, momentum & energy thickness, laminar and turbulent boundary layers on a flat plate; Laminar sub-layer, smooth and rough boundaries. Local and average friction coefficients. Separation and Control.

Module IV (8 hours)

Introduction to Open Channel Flow-Comparison between open channel flow and pipe flow, geometrical parameters of a channel, classification of open channels, classification of open channel flow, Velocity Distribution of channel section.

Uniform Flow: Energy Equation and Momentum Equation, Characteristics of uniform flow, Chezy's formula, Manning's formula. Factors affecting Manning's Roughness Coefficient "n. Most economical section of channel. Computation of Uniform flow, Normal depth.

Module V (10 hours)

Non-Uniform Open Channel Flow- Specific energy, Specific energy curve, critical flow, discharge curve Specific force Specific depth, and Critical depth. Channel Transitions. Gradually Varied Flow-Dynamic Equation of Gradually Varied Flow, Classification of channel bottom slopes, Classification of surface profile, Characteristics of surface profile. Computation of water surface profile. Hydraulic Jump- Theory of hydraulic jump, Elements and characteristics of hydraulic jump in a rectangular Channel, length and height of jump, location of jump, Types, applications and location of hydraulic jump. Froude Model Law.

Suggested Readings:

1. Singh, S., "Fluid Mechanics", Khanna Book Publishing Co., New Delhi.
2. Modi, P.M., and Seth, S.M. "Hydraulics and Fluid Mechanics", Standard Book House.

CVSA225T :STRUCTURAL ANALYSIS**4 Credits (3L:1T:0P)**

(4 Credits- 60 Hours)

Objectives:

The objective of this course is to equip students with the fundamental principles and analytical techniques necessary for understanding and analyzing various structures. The course aims to develop proficiency in using theorems of elasticity, deflection methods, influence line analysis, stability and buckling theories, and both flexibility and stiffness methods. Through a combination of theoretical learning and practical applications, students will gain the skills needed to solve complex structural engineering problems and design robust structures.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Apply principles of virtual work and strain energy to elastic structures. (Apply)

CO2: Determine deformations in beams and frames using various analytical methods. (Evaluate)

CO3: Analyze determinate and indeterminate structure using various approaches. (Analyze)

CO4: Evaluate stability of columns and struts using Euler's and Rankine's theories. (Evaluate)

Syllabus:

Module I: (12 hours)

General theorems: Theorems relating to elastic structures, principle of virtual work, strain energy in elastic structures, complementary energy, Castigliano's theorems, Maxwell-Betti's reciprocal theorem.

Deflection of statically determinate structures: Deflection of determinate beams by double integration (Macaulay's) method, moment area and conjugate beam methods, principle of virtual work (unit load method) and Castigliano theorems, Deflection of determinate pin jointed trusses and rigid jointed frames by principle of virtual work (unit load method), Strain Energy and Castigliano theorems.

Module II: (13 hours)

Approximate Analysis of Multi-Storied Frames: Approximate Analysis of Multi-Storied frames subjected to Vertical Loads, Method of Substitute Frames; Analysis of Building Frames subjected to Horizontal Loads, Portal Method and Cantilever Method.

Elastic arches: Normal thrust, shear force and bending moment for parabolic and segmental three hinged arches. Influence lines for normal thrust, shear force and bending moment for three hinged parabolic arch.

Module III: (15 hours)

Suspension bridges: Suspension cable with three hinged stiffening girder.

Column and Struts: Struts subjected to axial loads, concept of buckling. Euler's buckling theory of struts with different boundary conditions. Rankine's buckling theory for columns. Struts subjected to eccentric and lateral loads and struts with initial curvature.

Module IV: (20 hours)

Analysis of indeterminate structures by flexibility method: Flexibility coefficients and their use in the formulation of compatibility equations. Application of Castigliano's theorem of least work to propped cantilevers, fixed beams, continuous beams, simple pin jointed frames including effect of lack of fit of members, simple rigid jointed frames and two hinged arches.

Analysis of indeterminate structures by stiffness method: Stiffness coefficients and their use for formulation of equilibrium equation, direct stiffness method, slope deflection method, moment distribution method, applications of these methods to indeterminate beams, simple rigid jointed frames and rigid jointed frames with inclined members, including the effect of settlement/rotation of supports.

Suggested Readings:

1. Ramamrutham S. and Narayanan R. "Theory of Structures", 8th edition (2014), Dhanpat Rai Publishing Company.
2. Punmia B. C., Jain A. K. and Jain A. K. "Strength of Materials and Theory of Structures", 11th edition (2016), Laxmi Publications.
3. Timoshenko S. P. and Gere J. M. "Theory of Elastic Stability", 2nd edition (1961), McGraw-Hill.
4. Hibbeler R. C. "Structural Analysis", 9th edition (2014), Pearson Education.
5. Ghali A., Neville A. M. and Brown T. G. "Structural Analysis: A Unified Classical and Matrix Approach", 7th edition (2009), CRC Press.

CVCE226T :Construction Engineering and Management**B TECH -CVE IV****(3 credits – 45 hours) (3L:0T:0P)****Objectives**

The aim of the course is to familiarise students with the causes and quantification of earthquakes and to familiarise them with the effects of earthquakes and the design criteria required for the design of various geotechnical structures.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

1. Interpret project organization for executing construction projects. (Understanding)
2. Apply knowledge and skills of modern construction practices and techniques. (Applying)
3. Analyze the learning and understand techniques for Project planning, scheduling and Execution Control. (Analyzing)
4. Organize and monitor the construction projects with respect to time and cost. (Creating)

Module I: 2 Hours

Basics of Construction- Unique features of construction, construction projects types and features, phases of a project, agencies involved and their methods of execution.

Module II: 10 Hours

Construction project planning- Stages of project planning: pre-tender planning, preconstruction planning, detailed construction planning, role of client and contractor, level of detail. Process of development of plans and schedules, work break-down structure, activity lists, assessment of work content, concept of productivities, estimating durations, sequence of activities, activity utility data; Techniques of planning- Bar charts, Gantt Charts. Networks: basic terminology, types of precedence relationships, preparation of CPM networks: activity on link and activity on node representation, computation of float values, critical and semi critical paths, calendaring networks. PERT- Assumptions underlying PERT analysis, determining three time estimates, analysis, slack computations, calculation of probability of completion.

Module III: 8 Hours

Construction Methods basics: Types of foundations and construction methods; Basics of Formwork and Staging; Common building construction methods (conventional walls and slabs; conventional framed structure with blockwork walls; Modular construction methods for repetitive works; Precast concrete construction methods; Basics of Slip forming for tall structures; Basic construction methods for steel structures; Basics of construction methods for Bridges.

Module IV: 4 Hours

Construction Equipment basics: Conventional construction methods Vs Mechanized methods and advantages of latter; Equipment for Earthmoving, Dewatering; Concrete mixing, transporting & placing; Cranes, Hoists and other equipment for lifting; Equipment for transportation of materials. Equipment Productivities.

Module V: 5 Hours

Planning and organizing construction site and resources- Site: site layout including enabling structures, developing site organization, Documentation at site; Manpower: planning, organizing, staffing, motivation; Materials: concepts of planning, procurement and inventory control; Equipment: basic concepts of planning and organizing; Funds: cash flow, sources of funds; Histograms and S-Curves. Earned Value; Resource Scheduling- Bar chart, line of balance technique, resource constraints and conflicts; resource aggregation, allocation, smoothening and leveling. Common Good Practices in Construction.

Module VI: 4 Hours

Project Monitoring & Control- Supervision, record keeping, periodic progress reports, periodical progress meetings. Updating of plans: purpose, frequency and methods of updating. Common causes of time and cost

overruns and corrective measures. Basics of Modern Project management systems such as Lean Construction; Use of Building Information Modelling (BIM) in project management; Quality control: concept of quality, quality of constructed structure, use of manuals and checklists for quality control, role of inspection, basics of statistical quality control. Safety, Health and Environment on project sites: accidents; their causes, effects and preventive measures, costs of accidents, occupational health problems in construction, organizing for safety and health.

Module VII: 4 Hours

Contracts Management basics: Importance of contracts; Types of Contracts, parties to a contract; Common contract clauses (Notice to proceed, rights and duties of various parties, notices to be given, Contract Duration and Price. Performance parameters; Delays, penalties and liquidated damages; Force Majeure, Suspension and Termination. Changes & variations, Dispute Resolution methods

Module VIII: 8 Hours

Construction Costs: Make-up of construction costs; Classification of costs, timecost trade-off in construction projects, compression and decompression.

Suggested Readings:

CVSD338T: Structural Design –I

B Tech -Civil V

3 Credits - 45 hours- 3L:0T:0P

Course Objectives: The objective of this course is to familiarize the students with all fundamental concepts of reinforced cement concrete design. RCC has been the predominant structural entity in the present day civil engineering constructions. The main goal of this course is to provide students with all information concerning different principles, ways of analyzing, as well as structural designing and detailing of RCC elements. The knowledge acquired will lay a good foundation for analysis and design of various civil engineering structures/systems in a reliable manner.

COURSE/LEARNING OUTCOMES

After completion of the course students will be able to:

CO1: Explain the design philosophies of reinforced concrete structures related to the Working Stress Method. (Understanding)

CO2: Explain the design philosophies of reinforced concrete structures related to the Limit State Method. (Understanding)

CO3: Analyze and design reinforced concrete beams, columns and slabs (Analyzing, creating)

CO4: Analyze and design reinforced concrete foundation systems and staircases (Analyzing, Creating)

CO5: Interpret the basics of pre-stressed concrete design methodology (Understanding)

Module I:[8 Hours]

Working stress method and ultimate load method of design, Reinforced Concrete Fundamentals (working Stress Method): Concept of reinforced concrete, stress strain characteristics of concrete and steel reinforcement, elastic theory, singly reinforced, balanced section, under reinforced section and over reinforced section.

Module II: [8 Hours]

Limit state method of design, Concepts of probability and reliability, characteristic loads, characteristic strength, partial safety factors for loads and materials, introduction to limit states of collapse in flexure, direct compression, shear and limit states of serviceability in deflection and cracking

Module III: [8 Hours]

Design of singly and doubly reinforced rectangular and T sections for flexure, Design of members in shear and bond, Design of beam subjected to bending and torsion, Design of columns for Axial Load, Uni-axial bending moment and Bi-axial bending moment as per IS Code method.

Module IV:[8 Hours]

Design of one-way and two-way slabs, Design of Isolated square and rectangular footings subjected to axial load and moments, Design of combined foundations

Module V[5 Hours]

Design of Doglegged, Open well type staircases. Design of Flat slab and Post tensioned slab

Module VI: [8 Hous]

Pre-stressed concrete, Basic principles of pre-stressed concrete: materials used and their properties, methods and

systems of pre-stressing. Losses in pre-stress, analysis of various types of sections subjected to pre-stress and external loads. Prestressed and post tensioned members, Different types of Prestressed sections, Box-Section, Girder

CVEE339T: ENVIRONMENTAL ENGINEERING**(3 credits-45 hours) (L-T-P:3-0-0)**

Objectives: Starting with an introductory lesson on environment vis-a-vis pollution of its components, this course basically deals with various issues related to water supply to community as well as waste water treatment and disposal which constitutes a prime area of practice for civil engineers. Through this course students will get familiarize with land pollution, noise pollution and air pollution.

COURSE/LEARNING OUTCOMES

After successfully studying this course, students will be able to:

- CO1:** Relate the impact of humans on environment and environment on humans(understand)
- CO2:** Summarize the principles and operation of water, waste water, solid waste and air pollution treatment systems and the required appurtenances and accessories.(Understand)
- CO3:** Plan strategies to control, reduce and monitor pollution and select the most appropriate technique for the treatment of water, wastewater solid waste and contaminated air.(Applying)
- CO4:** Adapt with basic environmental legislation.(Applying)

Module I: 15 hours

Water: -Sources of Water and quality issues, water quality requirement for different beneficial uses, Water quality standards, water quality indices, water safety plans, Water Supply systems, need for planned water supply schemes, Water demand industrial and agricultural water requirements, Components of water supply system; Various valves used in W/S systems-

Water Treatment: aeration, sedimentation, coagulation flocculation, filtration, disinfection, advanced

treatments like adsorption, ion exchange, membrane processes

Module II: 10 Hours

Sewage- Domestic and Stormwater, Quantity of Sewage, Sewage flow variations. Conveyance of sewage- Sewers, shapes design parameters, operation and maintenance of sewers, Sewage pumping; Sewerage, Sewer appurtenances, Design of sewerage systems. Small bore systems, Storm Water- Quantification and design of Storm water; Sewage and Sullage, Pollution due to improper disposal of sewage, National River cleaning plans, Wastewater treatment, aerobic and anaerobic treatment systems, suspended and attached growth systems, recycling of sewage – quality requirements for various purposes.

Module III: 5 Hours

Air - Composition and properties of air, Quantification of air pollutants, Monitoring of air pollutants, Air pollution- Occupational hazards, Urban air pollution automobile pollution, Chemistry of combustion, Automobile engines, quality of fuel, operating conditions and interrelationship. Air quality standards, Control measures for Air pollution, construction and limitations

Module IV: 2 Hours

Noise- Basic concept, measurement and various control methods.

Module V: 8 Hours

Solid waste management-Municipal solid waste, Composition and various chemical and physical parameters of MSW, MSW management: Collection, transport, treatment and disposal of MSW. Special MSW: waste from commercial establishments and other urban areas, solid waste from construction activities, biomedical wastes, Effects of solid waste on the environment: effects on air, soil, water surface and ground health hazards. Disposal of solid waste-segregation, reduction at source, recovery and recycle. Disposal methods- Integrated solid waste management. Hazardous waste: Types and nature of hazardous waste as per the HW Schedules of regulating authorities.

Module VI: 3 Hours

Building Plumbing-Introduction to various types of home plumbing systems for water supply and waste water disposal, high rise building plumbing, Pressure reducing valves, Break pressure tanks, Storage tanks, Building drainage for high rise buildings, various kinds of fixtures and fittings used.

Module VII: 2 Hours

Government authorities and their roles in water supply, sewerage disposal. Solid waste management and monitoring/control of environmental pollution.

CVEE340T: Engineering Economics, Estimation & Costing**B Tech CVE -V****4 Credits : 3L:1T:0P**

Objectives: *This subject will introduce the students to the basics of estimation of quantity and cost of civil engineering projects including the methods of tendering and contracting. It also deals with the valuation of properties.*

Course Outcomes:**On completion of the course, the students will be able to :**

CO1: Have an idea of Economics in general, Economics of India particularly for public sector agencies and private sector businesses (Understand)

CO2: Perform and evaluate present worth, future worth and annual worth analyses on one of more economic alternatives. (Apply)

CO3: Carry out and evaluate benefit/cost, life cycle and breakeven analyses on one or more economic alternatives.

CO4: Understand the technical specifications for various works to be performed for a project and how they impact the cost of a structure.(Apply)

CO5: Quantify the worth of a structure by evaluating quantities of constituents, derive their cost rates and build up the overall cost of the structure. (Apply)

CO6: Understand how competitive bidding works and how to submit a competitive bid proposal.(Understand)

Module 1: (6 Hours)

Basic Principles and Methodology of Economics. Demand/Supply – elasticity – Government Policies and Application. Theory of the Firm and Market Structure. Basic Macro economic Concepts (including GDP/GNP/NI/Disposable Income) and Identities for both closed and open economies. Aggregate demand and Supply (IS/LM). Price Indices (WPI/CPI), Interest rates, Direct and Indirect Taxes.

Module 2: (6 Hours)

Public Sector Economics –Welfare, Externalities, Labour Market. Components of Monetary and Financial System, Central Bank –Monetary Aggregates; Commercial Banks & their functions; Capital and Debt Markets. Monetary and Fiscal Policy Tools & their impact on the economy – Inflation and Phillips Curve.

Module 3: 6 Hours

Elements of Business/Managerial Economics and forms of organizations. Cost & Cost Control –Techniques, Types of Costs, Lifecycle costs, Budgets, Break even Analysis, Capital Budgeting, Application of Linear Programming. Investment Analysis – NPV, ROI, IRR, Payback Period, Depreciation, Time value of money (present and future worth of cash flows). Business Forecasting – Elementary techniques. Statements – Cash flow, Financial. Case Study Method.

Module 4: (5 Hours)

Indian economy - Brief overview of post-independence period – plans. Post reform Growth, Structure of productive activity. Issues of Inclusion – Sectors, States/Regions, Groups of people (M/F), Urbanization. Employment–Informal, Organized, Unorganized, Public, Private.Challenges and Policy Debates in Monetary, Fiscal, Social, External sectors.

Module 5: (15 Hours)

Estimation / Measurements for various items- Introduction to the process of Estimation; Use of relevant Indian Standard Specifications for the same, taking out quantities from the given requirements of the work, comparison of different alternatives, Bar bending schedules, Mass haul Diagrams, Estimating Earthwork and Foundations, Estimating Concrete and Masonry, Finishes, Interiors, MEP works; BIM and quantity take-offs; adding

equipment costs; labour costs; rate analysis; Material survey-Thumb rules for computation of materials requirement for different materials for buildings, percentage breakup of the cost, cost sensitive index, market survey of basic materials. Use of Computers in quantity surveying

Module 6: (6 Hours)

Specifications-Types, requirements and importance, detailed specifications for buildings, roads, minor bridges and industrial structures.

Module 7: (6 Hours)

Rate analysis-Purpose, importance and necessity of the same, factors affecting, task work, daily output from different equipment/ productivity.

Module 8: (8 Hours)

Tender- Preparation of tender documents, importance of inviting tenders, contract types, relative merits, prequalification. general and special conditions, termination of contracts, extra work and Changes, penalty and liquidated charges, Settlement of disputes, R.A. Bill & Final Bill, Payment of advance, insurance, claims, price variation, etc. Preparing Bids- Bid Price buildup: Material, Labour, Equipment costs, Risks, Direct & Indirect Overheads, Profits; Bid conditions, alternative specifications; Alternative Bids. Bid process management

Module 9: (2 Hour)

Introduction to Acts pertaining to-Minimum wages, Workman's compensation, Contracts, Arbitration, Easement rights.

Term Work Assignments may include:

1. Deriving an approximate estimate for a multistoried building by approximate methods.
2. Detailed estimate, Cost of finishes, MEP works for the following with the required material survey for the same:
 - a. Ground plus three storied RCC Framed structure building with blockwork walls
 - b. bridge with minimum 2 spans
 - c. factory building
 - d. road work
 - e. cross drainage work
 - f. Ground plus three storied building with load-bearing walls
3. Preparation of valuation report in standard Government form.
4. Assignments on rate analysis, specifications and simple estimates.
5. Detailed estimate of minor structure.
6. Preparation of Bar bending schedule.

CVHW341T: Hydrology & Water Resources Engineering**B Tech CVE-V***(3 Credits-45 hours) (2L:1T:0P)*

Objectives: *This course is intended to make the students exposed to the key features of hydrological science including precipitation, data analysis, rainfall-runoff analysis, ground water hydrology, hydrographs, flood routing, hydrological design, risk analysis and uncertainty. It also familiarizes the students with important aspects of irrigation and dams & spillways.*

COURSE /LEARNING OUTCOMES

After the completion of the course, the students will be able to

CO1: Identify hydrological cycle components and measurement tools for precipitation. Analyze average precipitation depth and various abstractions like infiltration and evaporation. (Understand)

CO2: Understand hyetographs and hydrographs, and compute runoff. Evaluate well yield in saturated or unsaturated aquifers. (Apply)

CO3: Analyze the water requirements of crops, understand the various types of soil water, design regime channels, understand canal losses, canal lining and water logging. (Understand, Analyze)

CO4: Classify dam types, understand site selection and design of gravity and earth dams, analyze seepage, reservoir storage, yield, regulation, and sedimentation, and discuss spillway components. (Understand)

Module I: (3 hours)

Introduction - hydrologic cycle, water-budget equation, history of hydrology, World water balance, applications in engineering, sources of data.

Module II: (4 hours)

Precipitation - forms of precipitation, characteristics of precipitation in India, measurement of precipitation, rain gauge network, mean precipitation over an area, depth area- duration relationships, maximum intensity/depth-duration-frequency relationship, Probable Maximum Precipitation (PMP), rainfall data in India.

Module III: (6 hours)

Abstractions from precipitation - evaporation process, evaporimeters, analytical methods of evaporation estimation, reservoir evaporation and methods for its reduction, evapotranspiration, measurement of evapotranspiration, evapotranspiration equations, potential evapotranspiration over India, actual evapotranspiration, interception, depression storage, infiltration, infiltration capacity, measurement of infiltration, modelling infiltration capacity, classification of infiltration capacities, infiltration indices.

Module IV: (6 hours)

Runoff - runoff volume, SCS-CN method of estimating runoff volume, flow duration curve, flow-mass curve, hydrograph, factors affecting runoff hydrograph, components of hydrograph, base flow separation, effective rainfall, unit hydrograph surface water resources of India, environmental flows.

Module V: (6 hours)

Ground-water and well hydrology - forms of subsurface water, saturated formation, aquifer properties, geologic formations of aquifers, well hydraulics: steady state flow in wells, equilibrium equations for confined and unconfined aquifers, aquifer tests.

Module VI: (6 hours)

a) Water withdrawals and uses – water for energy production, water for agriculture, water for hydroelectric generation; flood control. Analysis of surface water supply, Water requirement of crops-Crops and crop seasons in India, cropping pattern, duty and delta;

b) Quality of irrigation water; Soil-water relationships, root zone soil water, infiltration, consumptive use, irrigation requirement, frequency of irrigation; Methods of applying water to the fields: surface, sub-surface, sprinkler and trickle / drip irrigation.

Module VII: (6 hours)

Distribution systems - canal systems, alignment of canals, canal losses, estimation of design discharge. Design of channels- rigid boundary channels, alluvial channels, Kennedy's and Lacey's theory of regime channels. Canal outlets: non-modular, semi-modular and modular outlets. Water logging: causes, effects and remedial measures. Lining of canals, types of lining. Drainage of irrigated lands: necessity, methods.

Module VIII: (8 hours)

a) Dams and spillways - embankment dams: Classification, design considerations, estimation and control of seepage, slope protection. Gravity dams: forces on gravity dams, causes of failure, stress analysis, elementary and practical profile. Arch and buttress dams.

b) Spillways: components of spillways, types of gates for spillway crests; Reservoirs- Types, capacity of reservoirs, yield of reservoir, reservoir regulation, sedimentation, economic height of dam, selection of suitable site.

Professional Elective course-1**CVSA342T: Structural Analysis-I (PEC-01)****B Tech CVE-V**

(3 Credits-45 hours) (2L:1T:0P)

Objectives: This course aims to equip students with the fundamental and advanced principles of structural analysis. It emphasizes understanding the behavior of structures under various loading conditions, applying classical and numerical methods, and using matrix approaches to analyze indeterminate structures. Students will gain skills in influence line construction, truss analysis, and the use of stiffness and flexibility matrices in structural systems.

Course Outcomes

At the end of the course, the student will be able to:

CO1 – Understand structural response under moving loads (Understand)

CO2 – Apply classical and numerical methods for structural analysis (Apply)

CO3 – Analyze indeterminate structures using matrix methods (Analyze)

Syllabus:

Module I: Moving Loads and Influence Lines: (16 hours)

Moving loads and Influence lines for statically determinate structures, Influence lines for cantilever beam, simply supported beam, overhanging beam and pin-jointed trusses, Criteria for maximum shear force and bending moment under moving loads for simply supported beams, Absolute maximum bending moment, Influence line diagrams for horizontal tension in the cable, shear force and bending moment at any section of the stiffening girder (Suspension bridge).

Module II: Classical and Numerical Methods: (13 hours)

Numerical analysis of plane trusses, grids and frames, Kani's method, Introduction to the finite element method for plane stress and plane strain

Module III: Matrix Methods in Structural Analysis: (16 hours)

Matrix Analysis of Framed Structures, Flexibility and Stiffness Matrices and their derivation and application, Local and global stiffness matrices, Relationship between flexibility and stiffness matrix

Suggested Readings:

2.CVRA343T: Railway and Airport Engineering

B Tech CVE V

(3 credits – 45 hours) (3L:0T:0P)

Objective: This course aims to provide a comprehensive understanding of Railway and Airport Engineering. It covers the design, construction, and maintenance of railway tracks and airports, including track alignment, rail components, geometric design, signalling, and track maintenance. Additionally, it addresses airport planning, site selection, runway and taxiway design, air traffic management, and airport terminal functions, preparing students for the engineering challenges in rail and air transportation systems.

COURSE/LEARNING OUTCOMES

On completion of the course, the students will be able to:

CO1: Describe the fundamental concepts of railway track design, including track gauges, alignment, and the components of railway tracks such as rails, sleepers, and ballast. (Understand)

CO2: Apply engineering principles to the geometric design of railway tracks, including curves, super-elevation, points, and crossings, and analyze the impact of tractive resistance and power on railway performance. (Apply, Analyze)

CO3: Develop maintenance and rehabilitation strategies for railway tracks, incorporating modern methods of track maintenance, track drainage, and the renewal of track components to ensure operational efficiency and safety. (create)

CO4: Analyze and design airport infrastructure, including runway and taxiway capacity, airport drainage, terminal aprons, and air traffic management systems, to accommodate air travel demand and enhance airport operations. (Create)

Module I: (12 Hours)

Fundamentals of Railway Engineering: Introduction to Railway Engineering: Overview of railway systems, Importance of railway engineering, Railway Track, Gauge and Alignment: Types of tracks, gauges, Principles of track alignment

Engineering Surveys and Construction of New Lines: Survey methods and tools, Steps in constructing new railway lines

Track Components and Stresses: Rails, sleepers, and ballast; Subgrade and formation; Track fittings and fastenings

Creep of Rails and Geometric Design: Causes and effects of rail creep; Geometric design of tracks, including curves and super-elevation

Module II: (12 Hours)

Advanced Railway Track Design :Points, Crossings, and Track Junctions: Design and construction of points and crossings; Simple track layouts and junctions

Rail Joints and Welding of Rails: Types of rail joints, Welding techniques and benefits

Track Maintenance and Drainage: Regular track maintenance practices, Importance and methods of track drainage

Modern Methods of Track Maintenance: Advanced technologies in track maintenance, Case studies of modern maintenance methods

Tractive Resistance and Power: Factors affecting tractive resistance, Calculation of tractive power

Module III: (11 Hours)

Railway Stations, Yards, and Signaling :Railway Stations and Yards: Design and layout of railway stations, Functions and types of railway yards

Railway Tunnelling: Methods and challenges of railway tunnelling

Signalling and Interlocking: Basics of railway signalling, Interlocking systems for safe railway operations

High-Speed Trains and Maintenance: Design and operation of high-speed trains, Maintenance practices specific to high-speed rail

Module IV: (10 Hours)

Airport Engineering Introduction to Airport Planning and Design: Overview of airport engineering, Aircraft characteristics and performance

Airport Planning and Air Travel Demand Forecasting: Techniques for forecasting air travel demand, Criteria for airport site selection

Geometric Design of the Airfield: Runway and taxiway design, Capacity and delay determination

Airport Terminals and Facilities: Design of passenger and cargo terminals, Airport drainage

Air Traffic Management and Navigational Aids: Ground-based and satellite-based navigational systems, Air traffic control and surveillance facilities, Airfield lighting systems

Suggested Readings

3. CVER0131: Earth Retaining Structures**B Tech CVE V****(3 credits – 45 hours) (3L:0T:0P)****Objectives**

The objective of this course is to prepare students to analyze and design various types of earth retaining structures.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

CO1: Understand various theories in Earth Pressure. (Understanding)

CO2: Explore the Stability of retaining structure. (Applying)

CO3: Analyze the sheet pile walls. (Analyzing)

CO4: Explain aspects related to the design of bulkheads, tunnels, conduits, and braced excavations. (Creating)

Module I: 5 Hours

Earth Pressure: Rankine and Coulomb theories, active, passive and pressure at rest; concentrated surcharge above the back fill, earth pressure due to uniform surcharge, earth pressure of stratified backfills, saturated and partially saturated backfill.

Module II: 10 Hours

Retaining walls: Proportioning of retaining walls, stability of retaining walls, mechanically stabilized retaining walls/reinforced earth retaining walls.

Module III: 15 Hours

Sheet Pile wall: free earth system, fixed earth system.

Module IV: 15 Hours

Bulkheads: bulkheads with free and fixed earth supports, equivalent beam method, Anchorage of bulkheads and resistance of anchor walls, spacing between bulkheads and anchor walls, resistance of anchor plates.

Module V: 15 Hours

Tunnel and Conduit: Stress distribution around tunnels, Types of conduits, Load on projecting conduits; Arching and Open Cuts: Arching in soils.

Module VI: 15 Hours

Braced excavations: Earth pressure against bracings in cuts, Heave of the bottom of cut in soft clays.

4.CVOC 345T: Open Channel Flow**B Tech CVE V****(3 credits) (3L:0T:0P)****Objectives**

The course provides a comprehensive understanding of the principles and dynamics of unsteady flows in open channels, emphasizing their importance and applications in engineering. the course will equip students with the knowledge and skills to apply various numerical methods for solving shallow water flow equations, focusing on the finite-Difference, Finite Element, and Finite Volume methods. It will also enable students to conduct detailed analyses and modeling of dambreak flows, flood routing, and surface irrigation systems, incorporating advanced techniques and real-world case studies.

Course Outcomes

After completing this course, students will be able to:

Develop the ability to predict unsteady flow behavior in diverse open channel scenarios. (Analysing)

Implement Finite-Difference, Finite Element, and Finite Volume methods to solve complex shallow water flow equations. (Applying)

Perform comprehensive flood routing analyses in various channel configurations and model surface irrigation flows. (Applying)

Syllabus:**Module 1: (5 hours)**

Introduction to Unsteady Open Channel Flow: Fundamentals of unsteady flow in open channels; Basic concepts of flow continuity, momentum, and energy equations

Module 2: (5 hours)

Shallow Water Flow Equations: Derivation of 1-D shallow water flow equations; Considerations for non-hydrostatic pressure distribution.

Module 3: (10 hours)

Numerical Methods for Flow Analysis: Introduction to numerical methods for solving differential equations; Finite-Difference Method (FDM); Finite Element Method (FEM); Stability and accuracy considerations in numerical methods.

Module 4: (12 hours)

Shock Capturing Techniques: Introduction to shock capturing methods; Finite Volume Method (FVM) for 1-D and 2-D flow equations; Implementation of shock capturing techniques; Case studies on shock capturing in practical scenarios.

Module 5: (8 hours)

Dambreak Flow Analysis: Physical phenomena of dambreak flows; Mathematical modeling of dambreak scenarios; Real-world applications and case studies.

Module 6: (5 hours)

Flood Routing Techniques: Flood routing in large channel networks; Flood routing in compound channels; Flood routing in channels with flood plains; Comparative analysis of different flood routing methods.

CVSD351T: Structural Design -II**B Tech CVE -VI****3 Credits -3L:0T:0P****Course Objectives**

The objective of the course is to teach the students methods and their application to design of steel structures.

Course Outcomes:

After completion of course, students will be able to,

CO1: Apply the limit state design philosophy for analysis and design of structural steel connections(Apply)

CO2: Apply the limit state design philosophy for analysis and design of structural steel components. (Apply)

CO3: Analyze and design structural steel roofing and flooring systems.(Create)

Module-I (12 hours)

Bolted and welded connections: **Introduction** to steel structures, principle of limit state design, riveted connection, design of bolted and welded connections, concept of net sectional area, tension member and connection with gusset plate, load carrying capacity, axially and eccentrically loaded joints, simple connection of bracket plates to columns, beam to beam and beam to column connections, design of framed, unstiffened and stiffened seat connections.

Module-II: (12 hours)

Flooring system: **Concept** of floor system with secondary beams, main beams and columns, design of simply supported beams using rolled steel sections, laterally restrained and unrestrained beams, plastic method of design, determination of collapse load of steel beams.

Module-III (12 hours):

Columns and bases: Members in compression, slenderness ratio and critical load, design of columns under axial loads using single or multiple rolled steel sections, design of lacing, battens, columns subjected to axial load and bending, design of slab and Gusseted base.

Module-IV (9 hours)

Roofing system :Imposed loads on flat and sloping roofs and floors, wind loads on sloping roofs and vertical cladding including effect of degree permeability and wind drag, analysis of pin-jointed trusses under various loading cases, computation of design forces in members, design of members, purlin and detailing of connections and supports.

Structural Design-II tutorial Class:

- Analysis and Design of roof truss system.
- Design of columns and columns bases.
- Design of structural steel flooring system.
- Design of bolted and welded connections.
- Study of Structural detail of construction drawings and checking adequacy and compliance with codes.

CVIT352T: INTELLIGENT TRANSPORTATION SYSTEMS**B Tech CVE-VI****(3 credits) (3L:0T:0P)**

Objective: The course is designed to provide an introduction to Intelligent Transportation Systems (ITS). It explores ITS data collection techniques, the role of telecommunications, and various functional areas like Advanced Traffic Management Systems (ATMS) and Advanced Public Transportation Systems (APTS). The course also addresses ITS user needs, automated highway systems, and global ITS implementations, emphasising both developed and developing countries.

COURSE/LEARNING OUTCOMES

On completion of the course, the students will be able to:

CO1: Explain the fundamental concepts, historical background, and benefits of Intelligent Transportation Systems (ITS), including data collection techniques and the importance of telecommunications within ITS.(Understand)

CO2: Apply ITS data collection methods such as AVL, AVI, GIS, and video data collection to real-world scenarios, and analyze their effectiveness in improving traffic and transportation management.(Apply)

CO3: Design and evaluate ITS functional areas, including ATMS, ATIS, CVO, AVCS, APTS, and ARTS, by integrating advanced technologies and user needs to enhance transportation efficiency and safety.(Apply)

CO4: Compare and contrast ITS implementations in developed and developing countries, assessing their challenges and benefits, and propose adaptable ITS solutions suitable for varying infrastructural contexts. (Analyze)

Detailed Syllabus:**Module I: Introduction to ITS and Data Collection Techniques (12 Hours)**

Definition and Objectives of ITS: Introduction to ITS, Identification of ITS objectives

Historical Background and Benefits of ITS: Evolution of ITS, Benefits of ITS in modern transportation

ITS Data Collection Techniques: Detectors, Automatic Vehicle Location (AVL), Automatic Vehicle Identification (AVI), Geographic Information Systems (GIS), Video data collection

Module II: Telecommunications in ITS and Traffic Management (10 Hours)

Role of Telecommunications in ITS: Importance of telecommunications in ITS, Information management

Traffic Management Centres (TMC): Functions and operations of TMC

Vehicle – Roadside Communication and Positioning Systems: Vehicle positioning systems, Communication between vehicles and roadside infrastructure

Module III: ITS Functional Areas (13 Hours)

Advanced Traffic Management Systems (ATMS): Components and benefits of ATMS

Advanced Traveler Information Systems (ATIS): Providing real-time information to travellers

Commercial Vehicle Operations (CVO): Enhancing efficiency in commercial vehicle operations

Advanced Vehicle Control Systems (AVCS): Vehicle control technologies

Advanced Public Transportation Systems (APTS): Improving public transportation through ITS

Advanced Rural Transportation Systems (ARTS): ITS applications in rural areas

Module IV: ITS User Needs, Services, and Global Implementations (10 Hours)

ITS User Needs and Services: Travel and traffic management, Public transportation management, Electronic payment systems, Commercial vehicle operations, Emergency management, Advanced vehicle safety systems, Information management

Automated Highway Systems and Vehicle Platoons: Concept of automated highway systems, Vehicles in platoons

Global ITS Programs: Overview of ITS implementations in developed countries, ITS in developing countries, Case studies and comparative analysis

CVSA353T: SUSTAINABLE AND GREEN CONSTRUCTION

B Tech CVE -VI

(4 Credits) (4L:0T:0P)

Objectives:

The objective of this course is to provide students with a comprehensive understanding of sustainable construction principles and practices. Students will learn about the historical context and principles of sustainable development, environmental science, and ecology. Students will explore the economic, ethical, and social dimensions of sustainable construction, preparing them to integrate sustainable practices in their professional careers and contribute to environmentally responsible and socially conscious building projects.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Apply principles of sustainable development and their application in construction. (Apply)

CO2: Evaluate energy-efficient and water management strategies in building projects. (Evaluate)

CO3: Analyze sustainable building materials, technologies, and waste management practices. (Analyze)

CO4: Assess the economic, ethical, and social impacts of sustainable construction. (Evaluate)

Syllabus:

Module I: (16 hours)

Introduction to sustainable Development: Definition and principles of sustainable development, Historical context and evolution of sustainability, Global and local challenges related to sustainability.

Environment Science and Ecology: Fundamentals of ecology, Biodiversity and conservation, Climate change and its impacts, Environmental pollution and waste management.

Sustainable construction Material and Technology: Green building materials and technologies, Life cycle assessment of materials, Resource efficiency and waste reduction in construction, Low-impact construction methods

Energy Efficiency in Buildings: Principles of energy-efficient design, Renewable energy integration in building design, Energy-efficient HVAC systems, Building energy modeling and simulation.

Module II: (14 hours)

Water Management in Construction: Sustainable water use in construction processes, Rainwater harvesting and greywater recycling, Water-efficient construction practices, Strategies for mitigating water pollution on construction sites.

Sustainable Site Planning: Site selection and evaluation for sustainable construction, green space planning and landscaping, and Sustainable storm water management,

Sustainable Building Design: Principles of green building design, Passive design strategies for energy efficiency, Daylighting and natural ventilation, Integration of sustainable technologies in design.

Module III: (15 hours)

Construction and Demolition Waste Management: Waste reduction and recycling in construction, Responsible demolition practices, Circular economy concepts in construction.

Building Certifications and Standards: LEED (Leadership in Energy and Environmental Design) certification, BREEAM (Building Research Establishment Environmental Assessment Method), other regional and international green building certifications.

Environmental Regulations and Policy: Building codes and regulations for sustainable construction - Environmental impact assessments - Government policies promoting green construction.

Module IV: (15 hours)

Economics of Sustainable Construction: Cost-benefit analysis for green building projects - Financial incentives for sustainable construction - Business models for green technologies in construction.

Project Management for Sustainable Construction: Sustainable project planning and execution - Stakeholder engagement and communication - Monitoring and evaluating sustainability performance

Ethics and Social Responsibility in Construction: Ethical considerations in sustainable construction - Social impacts of green construction projects - Community engagement and stakeholder involvement.

Program Elective Course 2**1.CVAS354T: ADVANCED STRUCTURAL ANALYSIS****B Tech CVE -VI****(4 Credits) (3L:1T:0P)****Objectives:**

The objective of this course is to provide students with a thorough understanding of the principles and applications of elasticity, model analysis, and the finite element method in structural analysis. Students will gain foundational knowledge and develop skills in analyzing and solving complex structural problems using classical and modern computational techniques.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Apply equilibrium and compatibility equations to elasticity problems. (Apply)

CO2: Examine model analysis to measure structural forces and deformations. (Analyze)

CO3: Adapt FEM for stress-strain analysis in structural domains. (Create)

CO4: Apply fundamental principles of elasticity and structural analysis for structural simulations. (Apply)

Syllabus:

Module I: Elasticity (13 hours)

Introduction, Components of strain and strain, Hooke's law, Plane stress and plane strain, Equations of equilibrium and compatibility, Boundary conditions,

Module II: Two-Dimensional Problems and Beam Bending (16 hours)

Two dimensional problems in rectangular and polar coordinates, Bending of simple and cantilever beams, Boundary Value Problems in Polar Coordinates, Material Non-Linearity in Beam Bending.

Module III: Model Analysis in Structural Engineering (16 hours)

Structural similitude, Direct and indirect model analysis, Model material and model making, Measurement for forces and deformations.

Module IV: Introduction to Finite element method for structural analysis (15 hours)

Review of principle of virtual work, Ritz method, Discretization of domain, Basic element shape, Discretization process, Application of finite element method to one and two- dimensional plane stress strain elements.

2. CVRE355T: River Engineering

B.Tech-CVE VI

(4 credits) (L-T-P: 3-1-0)

Objectives

This course provides an in-depth understanding of river behaviour, essential for practising hydraulic and water resources engineers. It covers the principles of river morphology, sediment transport mechanics, and river dynamics. Students will learn to measure various river parameters, use physical and mathematical models to predict river behaviour, and design river training and flood protection structures. The course also addresses the practical aspects of river protection, training works, and restoration.

Course Outcomes

After completing this course, students will be able to:

CO1. Develop skills in measuring and analysing river parameters such as stage, discharge, and sediment load. (Understand)

CO2. Predict river behaviour using knowledge of river morphology and sediment transport mechanics. (Analysing)

CO3. Implement effective river training and flood protection structures. (Applying)

CO4. Solve practical problems in river engineering using mathematical and physical models. (Applying)

Syllabus:**Module 1: (5 hours)**

River Morphology: Fundamentals of river behaviour and morphology; Understanding bars, bends, and meanders; Analysis of thalweg, braiding, and bifurcations.

Module 2: (15 hours)

Sediment Transport Mechanics: Bed forms and bed load transport; Mechanics of suspended sediment transport

Critical shear stress and sediment transport equations.

Module 3: (10 hours)

Aggradation and Degradation: Processes of aggradation and degradation in rivers; Local scour at bridge piers and other hydraulic structures; Case studies on aggradation and degradation impacts.

Module 4: (5 hours)

Measurements in Rivers: Techniques for stage measurements and channel geometry; Discharge measurements and sediment samplers; Methods for measuring suspended and bed load sediment.

Module 5: (10 hours)

Physical and Mathematical River Models: Introduction to fixed and movable bed models; Sectional and distorted models; Mathematical models for predicting aggradation, degradation, and local scour.

Module 6: (15 hours)

River Protection and Training Works: Design and implementation of revetments, dikes, gabions, and spurs; Bank protective measures and bed control structures; River training and flood protection structures; Diversion and cofferdams, river regulation systems; Techniques for dredging, disposal, and river restoration.

Professional Elective Course-3**1. CVFE356T: Foundation Engineering**

4 credits- (4L:0T:0P)

Course Objective:

After Successful completion of the course students will be able to:

1. Decide the type of foundations to be recommended for construction of different engineering structures
2. Design different types of foundations

Course Outcomes:

CO1: Identify a suitable foundation system for a structure, methods of soil exploration, (Understand)

CO2: Estimate Lateral earth pressure and retaining wall, Bearing capacity and settlement of shallow foundation, Analyze and design shallow foundations, and pile foundations. (Apply, Analyze)

CO3: Evaluate the importance of raft foundation, analyze and design of well foundation. (Evaluate)

CO4: Examine and discuss various machine foundations, Analyze and design Sheet piles and cofferdams, foundation on problematic soil. (Analyze)

Syllabus:

Module I: (3 Hour)

Introduction: Foundation Engineering, Importance and Purpose, Classification and general requirement, Factors influencing the choice of a foundation, Selection of the type

Module II: (10 Hours)

Soil Exploration: Introduction, Methods of exploration, Planning the exploration programme, Method of boring, Soil sampling and soil samplers, Vertical and lateral extent of borings, Field tests like Penetration test (Standard Penetration Test, Static Cone Penetration Test, Dynamic Cone Penetration Test) Pressure meter tests, dilatometer test and field Vane shear test. Groundwater observations, Borehole logs, Site investigation reports

Module III: (12 Hours)

Lateral Earth Pressure Theories and Retaining Walls [10 Hours]: Introduction, Effect of wall movement on Earth pressure, Earth pressure at Rest, Classical Earth Pressure Theories, Rankine's theory, Coulomb's theory, Yielding of wall of limited height, Graphical solution for coulomb's earth pressure, Trial wedge method for earth pressure, proportioning of retaining walls, Stability of retaining walls

Module IV : (3 Hours)

Flexible Retaining Structures and Cofferdams: Introduction, Cantilever sheet pile wall, Anchored wall, Cofferdams

Module V : (12 Hours)

Bearing Capacity and Settlement of Shallow Foundations [6 Hours]: Introduction, Basic Definitions and their relationship, Principle modes of soil failure, Bearing capacity by classical Earth pressure theory of Rankine, Pauker and Bell's bearing capacity theory of failure, Prandtl's theory of failure, Terzaghi's method of determining bearing capacity of soil, Effect of water table on bearing capacity, Extension of Terzaghi's bearing capacity theory, Recent bearing capacity theories, Bearing capacity from In-situ tests (Plate load test), Types of settlement and their relationships. Allowable settlement and allowable bearing pressure, Steps involved in the proportion of footings

Module VI : (4 Hours)

Mat Foundations: Introduction, Common types of mat foundation, bearing capacity and settlement of mat foundations Compensated foundation, Analysis of mat foundation

Module: VII: (6 Hours)

Pile Foundations: Introduction, Types and uses of piles, Construction of piles, Selection of pile type, Types of foundations to suit subsoil conditions, Pile driving formulae, Static pile load formulae, Load test on piles, Dynamics pile formulae, Pile capacity from in-situ tests. Group action of piles, Negative skin friction, laterally load piles, Piles subjected to uplift loads

Module VIII: (10 Hours)

Well Foundations : Introduction, Types of wells or caissons, Components of a well foundation, Shapes of wells, Depth of a well foundation, Forces acting on well foundation, Lateral stability of well foundation, Construction and sinking of a well, Foundations on problematic soils: Foundations for collapsible and expansive soil

2.CVSH357T: Surface Hydrology**B Tech CVE -VI****4 Credits - 4L: 0 T: 0P**

COURSE OBJECTIVES: The Course will introduce the overall concept of surface water hydrology for understanding how the measurements and estimation of surface water is done. This course will help in comprehending the various hydrograph parameters and thereby applying the various methods of flood estimation as well as flood routing.

COURSE OUTCOME: At the end of the course, students will be able to:

CO1: Understand the hydrologic cycle and its components (Understand)

CO2: Understand the runoff estimation methods and their measurement techniques (Understand)

CO3: Understand the hydrograph generation and the parameters (Understand)

CO4: Estimate the flood magnitude and flood routing (Evaluate)

Syllabus :**Module I: [15 hours]**

Introduction to hydrologic system and hydrologic budget, fundamental laws of hydrology; atmospheric water vapor, introduction to hydrologic Inputs like precipitation and its forms, snowfall and rainfall; measurement techniques and space-time characteristics, hydrologic data sources (10 hours)

Module II: [15 hours]

Introduction to Hydrologic Abstractions like infiltration, depression storage, evapotranspiration and its measurement techniques, space time characteristics and their modeling, introduction to stream flow measurement techniques, space-time characteristics, rating curves.

Module III:[15 hours]

Streamflow measurement: Stage measurement, Velocity measurement, Bed load measurement and suspended load measurement, Indirect methods, Stage-Discharge relationship Runoff: Runoff, interflow, ground-water flow, Runoff characteristics, SCS-CN Method, Estimating reservoir capacity

Module IV: [15 hours]

Flood Analysis: Rational method, Empirical Formulas, Flood Frequency Analysis, Regional Flood Frequency Analysis, Risk and Reliability, Flood Routing: Reservoir routing, Channel routing, Conceptual model.

CVRA468T: Robotics and Automation**B Tech CVE -VII****2 Credits - 2L: 0 T: 0P****Course Objectives:**

This course aims to introduce students to the fundamental principles of robotics and automation and their emerging applications in civil engineering. It familiarizes learners with sensors, actuators, robot kinematics, dynamics, autonomous systems, and UAV technologies relevant to construction, structural, and geotechnical engineering. The course also explores the role of machine learning and artificial intelligence in predictive maintenance, site monitoring, and decision-making. In addition, it develops awareness of human–robot collaboration, safety considerations, and the legal and ethical frameworks governing the deployment of robotics and automation in civil engineering practice.

Course Outcomes:

CO1: Explain the fundamental concepts of robotics, automation, sensors, actuators, and their relevance to civil engineering applications. (Level: Understand)

CO2: Apply the principles of robot kinematics, dynamics, and autonomous systems to construction, structural, and geotechnical engineering tasks. (Level: Apply/Analyze)

CO3: Evaluate the role of robotics, UAVs, machine learning, and AI in structural health monitoring, site inspection, predictive maintenance, and disaster response. (Level: Analyze/Evaluate)

CO4: Discuss the legal, ethical, and safety considerations in deploying automated and collaborative robotic systems in civil engineering. (Level: Understand/Analyze)

Module I

Introduction to Robotics and Automation: Definition and basic principles of robotics and automation, Historical perspective and evolution, Applications in civil engineering

Module II

a. Fundamentals of Civil Engineering: Overview of civil engineering disciplines (structural, geotechnical, transportation, etc.), Basic principles of construction and infrastructure development .

b. Sensors and Actuators: Types of sensors used in civil engineering applications, Actuators and their role in automation, Integration of sensors and actuators in robotic systems

Module III

a. Robot Kinematics and Dynamics: Basics of robot motion and manipulation, Forward and inverse kinematics, Dynamics of robot motion

b. Robotics in Construction: Autonomous construction vehicles, Robotic construction equipment, Robotic assembly and fabrication in construction

Module IV

a. Automation in Structural Engineering: Automated inspection and maintenance of structures, Robotic construction of buildings and bridges, Structural health monitoring using automation

b. Unmanned Aerial Vehicles (UAVs) in Civil Engineering:

Aerial surveying and mapping, UAVs for site inspection and monitoring, Applications in geotechnical engineering and slope stability analysis

Module V

Automation in Geotechnical Engineering: Automated soil sampling and testing, Autonomous drilling and excavation in geotechnical applications, Robotics in tunneling and underground construction

Module VI

a. Human-Robot Collaboration: Collaborative robots (cobots) in civil engineering, Safety considerations in human-robot interaction, Case studies of successful human-robot collaboration in construction

b. Robotics in Disaster Response and Recovery: Use of robots in disaster-stricken areas, Search and rescue robotics, Automated infrastructure inspection after disasters

Module VII

Machine Learning and Artificial Intelligence in Civil Engineering: Introduction to machine learning and AI, Applications in predictive maintenance, AI-driven decision-making in civil engineering projects

Module VIII

Legal and Ethical Considerations: Regulations and standards for robotics in civil engineering, Ethical considerations in the use of automation, Liability and safety standards

Program Elective Course – 4

1. CVGI469T: Ground Improvement Techniques

B Tech CVE-7

(3 credits – 45 hours) (L-T-P: 3-0-0)

Objectives

This course aims to provide students with a comprehensive understanding of ground improvement techniques and their applications to various soil conditions and construction requirements. It covers mechanical, hydraulic, chemical and thermal modification methods as well as soil reinforcement with geosynthetics and promotes the ability to design and analyze stable and efficient reinforced soil structures.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

1. Demonstrate the need and different situations requiring ground improvement. (Understanding)
2. Apply various modification techniques for ground improvement. (Applying)
3. Analyze and select appropriate soil reinforcement techniques for different scenarios. (Analyzing)
4. Design structures using soil reinforcement techniques. (Creating)

Module I: 5 Hours

Introduction: Need for Ground Improvement, Different types of problematic soils, Emerging trends in ground Improvement.

Module II: 8 Hours

Mechanical modification: Dynamic compaction, impact loading, compaction by blasting, vibro-compaction; pre-compression, stone columns; Hydraulic modification: dewatering systems, preloading and vertical drains, electro-kinetic dewatering.

Module III: 8 Hours

Chemical modification: Modification by admixtures, stabilization using industrial wastes, grouting.

Module IV: 8 Hours

Thermal modification: Ground freezing and thawing.

Module V: 8 Hours

Soil reinforcement: Reinforced earth, basic mechanism, type of reinforcements, selection of stabilisation/improvement of ground using Geotextiles, Geogrid, geomembranes, geocells, geonets, and soil nails.

Module VI: 8 Hours

Application of soil reinforcement: Shallow foundations on reinforced earth, design of reinforced earth retaining walls, reinforced earth embankments structures, wall with reinforced backfill, analysis and design of shallow foundations on reinforced earth, road designs with geosynthetics.

2.CVTE470T: TRAFFIC ENGINEERING AND MANAGEMENT**B Tech CVE-VII**

(3 credits – 45 hours) (L-T-P: 3-0-0)

Objective: This elective course is designed to familiarise the students with the concepts of traffic engineering by providing general concepts of planning, functional design, traffic operation and management of road transportation. Forecasting of traffic, probabilistic approach towards traffic flow theory, highway capacity and study of road accidents has been introduced in detail.

COURSE/LEARNING OUTCOMES

On completion of the course, the students will be able to:

CO1: Define the traffic components and assess the traffic characteristics and related problems.(Understand)

CO2: Develop a strong knowledge base of highway capacity, traffic planning and its management in any transportation area.(Understand)

CO3: Understand elements of highway safety and approaches to accident Studies.(Understand)

CO4: Analyse the design of traffic control devices, forecasting tools and their techniques in transportation interaction.(Analyse. Apply)

Module I: Traffic Forecast and Transportation Demand Management (12 hours)

Traffic Forecast: General travel forecasting principles, Different methods of traffic forecast - Mechanical and Analytical methods, Demand relationships, Methods for future projection; Design Hourly Volume for Varying Demand Conditions: Concept of Design vehicle units and Determination of PCU under mixed traffic conditions, Price-volume relationships, Demand functions. Determination of design hourly volume; Critical Hour concept

Module II: Highway Capacity and Level of Service (7 hours)

Highway Capacity: Factors affecting capacity, level of service; Capacity studies - Capacity of different highway facilities including unsignalised and signalised intersections. Problems in Mixed Traffic flow; Case studies

Module III: Accident Studies (8 hours)

Accident Analysis: Analysis of individual accidents and statistical data; Methods of representing accident rate; Factors influencing traffic accidents; influence of roadway and traffic conditions on traffic safety; accident coefficients; Driver strains due to roadway and traffic conditions.

Module IV: Traffic Flow Theory and Simulation (18 hours)

Traffic Flow Theory: Fundamental flow relationship and their applications, Traffic flow theories and applications; Shock waves; Queuing theory and applications; Probabilistic Aspects of Traffic Flow: Vehicle arrivals, distribution models, gaps and headway distribution models; gap acceptance merging parameters, delay models, applications; Simulation: Fundamental principle, application of simulation techniques in traffic engineering - formulation of simulation models, Case studies.

3.CVSD471T: Structural Dynamics

B Tech CVE-7

3 Credits -45 hours (3L-0T-0P: 3credits)

Course Objectives

- To understand characteristics of dynamic system, types of excitation and principle of forming equation of motions.
- To find out the response of single degree freedom system under free and forced vibration
- To analyse millidegree freedom system and its application to shear building model
- To find out the dynamic response of continuous system

Course Outcome

CO1: Familiarization with the formulation of problems for dynamic analysis (Understand)

CO2: Development of equations of motions for SDF system and different approaches for solution (Create)

CO3: To be able to find the response of MDF and continuous systems using modal analysis (Apply)

CO4: To be familiar with different numerical methods to find out the dynamic response of a system (Understand)

Module I: (8 hours)

Introduction : Static and dynamic load, Dynamic loading in real life, Effect of dynamic load on structure, Nature of excitation, vibration terminology, Degrees of freedom, Characteristics of dynamic system-inertia, spring and damping force, Types of vibration-Free and forced vibration, Free body diagram, D'Alembert's principle

Module II: (15 hours)

Single Degree Freedom system: Equation of motion, energy method, natural frequency of SDF, viscous damping, undamped oscillation, underdamped and overdamped condition, free vibration response of Single Degree Freedom system for given initial condition, Idealized SDF system, logarithmic decrement. Forced vibration, response to harmonic excitation, support motion, vibration isolation, vibration measuring instruments, response to arbitrary excitation, Duhamel integral, Response spectra, response spectra for elastic and inelastic design.

Module III : (12 hours)

Multidegree freedom system : Two degrees of freedom system, natural frequencies and normal modes, forced vibration of multi degree freedom system, mode superposition technique, orthogonality condition of normal modes, Natural frequencies and normal modes of shear building, Base excitation in multistoried building, Equivalent static load at floor level due to earthquake excitation, IS 1893-2016 method.

Module IV: (10 hours)

Continuous system : Relation between discrete and continuous system, Axial vibration of rods, Bending vibrations of beams, boundary conditions and eigen value problems, mode shape functions and natural frequencies, orthogonality of mode shape functions, Rayleigh's approximate method.

Program Elective Course – 5**1. CVEQ476T: EARTHQUAKE ENGINEERING****BTech CVE-VIII**

(4 credits - 60 hours) (L-T-P: 3-1-0)

Objective: The main objective of this course is to illustrate the fundamentals of structural and soil dynamics to foresee the potential consequences of strong earthquakes on urban areas and civil infrastructure. The course deals with the problems and solutions in attaining efficient earthquake-resistant structures and facilities. This course will be a stepping stone towards designing, constructing and maintaining structures to perform at earthquake exposure up to the expectations and in compliance with building codes.

COURSE OUTCOMES

On completion of the course students will be able to:

CO1: Explain the basic elements of engineering seismology and theory of vibrations. (Understand)

CO2: Interpret the earthquake behavior of buildings and compare various vibration control measures, base isolation

Techniques (Understand)

CO3: Solve the equations of dynamic motions for SDOF and MDOF systems. (Apply)

CO4: Estimate the seismic performance of buildings with respect to site specific response and design spectra (Evaluate)

CO5: Illustrate the detailing requirements of buildings for earthquake resistant construction as per codal provisions (Understand)

Module I: Elements of seismology (8 Hours)

Causes of earthquake, geological faults, tectonic plate theory, elastic rebound, epicentre, hypocentre, primary, shear and Rayleigh waves, seismogram, magnitude and intensity of earthquakes, magnitude and intensity scales, spectral acceleration, information on some disastrous earthquakes

Module II: Theory of vibrations (12 Hours)

Concept of inertia and damping, types of damping, difference between static forces and dynamic excitation

Module III: Analysis of single and multi-degree of freedom systems (20 Hours)

SDOF idealization - equations of motion of SDOF system for mass as well as base excitation, free vibration of SDOF system, response to harmonic excitation, impulse and response to unit impulse, Duhamel integral, introduction to multiple degree of freedom systems, two degree of freedom system, normal modes of vibration, natural frequencies, mode shapes, decoupling of equations of motion, concept of mode superposition

Module IV: Design of earthquake resilient structures (20 Hours)

Response of structures to earthquake, response and design spectra, design earthquake, concept of peak ground acceleration, site specific response spectrum, effect of soil properties and damping, liquefaction of soils, importance of ductility, methods of introducing ductility into RC structures, design methodology, codal provisions and design as per the codes IS 1893, IS 13920 and IS 4326, base isolation techniques, vibration control measures, important points in mitigating effects of earthquake on structures

2.CVDO477T: Design of Hydraulic Structures

B Tech CVE VIII

3 Credits : 3L: 0 T: 0P

COURSE OBJECTIVES: The objective of this course is to provide students with an advanced understanding of the analysis and design of various types of hydraulic structures.

COURSE OUTCOME: At the end of the course, students will be able to

CO1: Understand the hydraulic structures for water resources projects(Understand)

CO2: Analyse the construction and design principles of embankment and gravity dam(Analyze)

CO3: Analyse and solve problems on dam outlet works and terminal structures(Analyze. Apply)

CO4: Analyse and solve problems on dimensional analysis and design of physical models of hydraulic structures (Analyze, Apply)

Syllabus

Module I: (10 hours)

Introduction: Hydraulic structures for water resources projects.

Module II: (15 hours)

Introduction to embankment dams, its types, design considerations, seepage analysis and control, stability analysis, construction techniques, introduction to gravity dam, forces acting on and failure of a gravity dam, stress analysis, elementary profile, design of gravity dam, other functional features of a gravity dam.

Module III: (10 hours)

Introduction to dam outlet works, types of outlet structures, ogee spillway, chute spillway, siphon spillway, side channel spillway, labyrinth and piano key weir, introduction to terminal structure, hydraulic jump types, stilling basin, roller bucket, ski jump basin, baffled spillway, drop structure.

Module IV: Introduction to hydraulic modeling and its basic principles, dimensional analysis, design of physical models of hydraulic structures.

Suggested readings:

3. CVRW478T Rainwater harvesting

B Tech CVE VIII

3 Credits :3L: 0 T: 0P

Course Objectives

This course aims to equip civil engineering students with the knowledge and skills required to design, implement, and manage rainwater harvesting systems with the focus on integration of these systems into civil engineering projects. The course is framed with following objectives.

- To understand the various types and components of a rainwater harvesting system
- To develop technical skills in the design, installation, maintenance, and management of rainwater harvesting systems.
- To design and install a rainwater harvesting system for residential buildings.

Course Outcomes

CO1: Familiarization with various types and components of a rainwater harvesting system (Understand)

CO2: Understanding the suitability of various rainwater harvesting system (Understand)

CO3: Understanding the design principles of a rainwater harvesting system. (Understand)

CO4: Applying the design and installation procedure for residential buildings (Apply)

Module-I: (5 hours)

CONCEPT OF RAIN WATER HARVESTING: Introduction to types of groundwater recharge structures and factors affecting groundwater recharge structures. Design principles of groundwater recharge structures. Types of Rainwater Harvesting Systems: Rooftop rainwater harvesting, Surface runoff harvesting, Groundwater recharge techniques.

Module II: (10 hours)

COMPONENTS OF RAIN WATER HARVESTING SYSTEM: Collection surfaces and conveyance systems, Storage tanks, cisterns, and reservoirs. Filtration and purification technologies.

Module III: (15 hours)

DESIGN PRINCIPLES RAIN WATER HARVESTING SYSTEM: Site assessment and feasibility studies, system sizing and capacity calculations, structural and material considerations in design, incorporating rainwater harvesting in urban infrastructure, design considerations for residential, commercial, and industrial buildings.

Module IV: (15 hours)

Installation and Implementation OF RAIN WATER HARVESTING SYSTEM: Installation procedures and best practices, addressing common challenges during implementation, routine maintenance.

Suggested Reading:

1. Lancaster, B, "Rainwater Harvesting for Drylands and Beyond", Tucson, Arizona Rainsource Press, 2008
2. Laureano, P, "Water Conservation Techniques in Traditional Human Settlements", Copal Publishing Group, 2013.

Program Elective Course – 6**1. CVBE479T: BRIDGE ENGINEERING (L:T:P- 3:1:0)****B Tech CVE VIII****(4 Credits- 60 Hours)****Objectives:**

This course aims at knowledge development of principles of engineering mechanics, load transfer mechanisms, analysis methodologies, design principles, damage mechanics, failure mechanisms, and construction, inspection, maintenance, repair and retrofit strategies in the realm of bridge engineering.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Explain the classification and design considerations for various types of bridges. (Evaluate)

CO2: Design concrete bridge elements including slabs, T-beams, and box girders using various IRC loading. (Create)

CO3: Design steel bridges such as plate girder and truss bridges using various IRC loading. (Create)

CO4: Analyze substructures including piers, abutments, and foundations with seismic considerations. (Analyze)

Syllabus:**Module I: General (13 hours)**

Classification of bridges, site selection, geometric and hydraulic design consideration, loading standards for highway and railway bridges, general design consideration; optimum spans.

Module II: Concrete bridges (14 hours)

Culverts; Slab, T-beam, box girder bridges, balanced cantilever bridge, cable stayed bridge, extrados bridges; arch bridge; Special requirements for Pre-stressed Concrete bridges.

Module III: Steel bridges (15 hours)

Plate Girder Bridge, truss bridge, suspension Cable Bridge, cable stayed bridge.

Module IV: Substructures (18 hours)

Design of piers and abutments, pile and well foundations, bearings and expansion joints, special wearing coats, seismic design considerations, Aerodynamic stability considerations, special durability measures, provisions for inspection and maintenance.

Suggested Readings:

1. Krishna Raju N. "Design of Bridges", 4th edition (2009), Oxford & IBH Publishing Co. Pvt. Ltd.

2. CVUT480T: URBAN TRANSPORTATION PLANNING**B Tech CVE VIII**

(4 credits – 60 hours) (L-T-P: 4-0-0)

Objective: This course aims to provide a comprehensive understanding of urban transportation planning and modelling. It covers urban morphology, urbanisation, travel demand, and activity systems, and emphasises a systems approach to transportation planning. The course also addresses the preparation, evaluation, and implementation of transportation plans, incorporating policy and case studies for practical insights.

COURSE/LEARNING OUTCOMES

On completion of the course, the students will be able to:

CO1: Explain the fundamental concepts of urban morphology, urbanization, travel demand, and urban activity systems, including various approaches to urban transportation planning such as trip-based and activity-based methods. (Understand)

CO2: Apply urban transportation planning techniques to real-world scenarios, including inventory, model building, forecasting, and evaluation. Analyze trip generation, distribution, and modal split models to understand travel patterns and behavior. (Apply)

CO3: Develop and evaluate alternative urban transportation plans using various assignment methods, land use transportation models, and quick response techniques. Synthesize transportation solutions and assess their effectiveness in addressing urban transport problems. (Create)

CO4: Design and implement urban transportation projects, considering financing, monitoring, and policy aspects. Critically evaluate urban development planning policies and case studies to draw insights for practical application in urban transportation planning. (Create)

Module I: Fundamentals of Urban Transportation Planning (15 Hours)

Urban Morphology and Urbanization: Definition and components of urban morphology, Trends and impacts of urbanization on travel demand

Urban Activity Systems and Travel Patterns: Understanding urban activity systems, Analysis of travel patterns in urban areas

Systems Approach in Urban Transportation Planning: Overview of systems approach, Comparison of trip-based and activity-based approaches

Goals, Objectives, and Constraints in Urban Transportation Planning: Setting goals and objectives, Identifying constraints in transportation planning

Inventory, Model Building, Forecasting, and Evaluation: Steps in inventory and data collection, Model building techniques, Forecasting travel demand, Evaluation of transportation plans

Module II: Trip Generation and Distribution Models (15 Hours)

Study Area Delineation and Zoning: Defining the study area, Zoning principles and practices

UTP Survey and Trip Generation Models: Conducting UTP surveys, Classification of trips — productions and attractions, Trip rate analysis, Multiple regression models and category analysis

Trip Distribution Models: Growth factor models, Gravity model and opportunity models

Modal Split Models: Mode choice behavior, Trip end and trip interchange models, Probabilistic models, utility functions, and logit models, Two-stage model for mode split

Module III: Traffic Assignment and Land Use Transportation Models (16 Hours)

Traffic Assignment Methods: Transportation networks and minimum path algorithms, Assignment methods — All-or-Nothing, capacity restrained, and multi-path assignment, Route-choice behavior and analysis

Land Use Transportation Models: Urban forms and structures, Location models and accessibility, Land use models and Lowry derivative models, Quick response techniques

Non-Transport Solutions for Transport Problems: Exploring non-transport solutions, Integrating land use and transportation planning

Module IV: Plan Preparation, Implementation, and Policy (14 Hours)

Preparation of Alternative Plans: Developing alternative transportation plans, Techniques for plan preparation

Evaluation Techniques: Methods for evaluating transportation plans, Criteria for assessment

Plan Implementation and Monitoring: Steps for implementing transportation plans, Monitoring and performance evaluation

Financing of Projects: Funding sources and financial planning

Urban Development Planning Policy: Policy formulation and analysis, Case studies of successful urban transportation projects

CVGW481T :GROUNDWATER HYDROLOGY

B Tech CVE-VIII

(4 Credits) (L: T:P: 4-0-0)

Objectives

To learn the fundamentals of groundwater flow.

To learn the hydraulics of different kinds of wells.

To evaluate the aquifer parameters and groundwater level variations for different hydro-geological boundary conditions.

To understand the various facets of ground water quality modelling.

Enable the learners to understand the significance of conjunctive use of ground water along with other fresh water sources.

Course/ Learning Outcomes

At the end of this course students will be able to:

CO1: Explain the aquifer properties and movement of ground water. (*understand*)

CO2: Solve well hydraulics problems under various hydrogeological scenarios. (*apply*)

CO3: Appraise the basic concepts and techniques associated with ground water flow modelling. (*evaluate*)

CO4: Identify major sources and types of groundwater contamination. (*understand*)

CO5: Identify the challenges and formulate strategies necessary for groundwater management. (*understand, create*)

Detailed Syllabus

Module I (15 hours)

Introduction: Introduction of ground water resources: Definition of groundwater, role of groundwater in hydro-logical cycle, Global and Indian perspectives, Occurrence of ground water, Geological factors governing the occurrence of ground water, groundwater bearing formations, classification of aquifers, flow and storage characteristics of aquifers, Darcy's law, anisotropy and heterogeneity, Governing Equations for Groundwater Flow: Dupuit-Forchheimer assumptions, general differential equations governing groundwater flows and their analytical solutions.

Module II (15 hours)

Wells and Well Hydraulics: Different types of wells, construction of wells, steady and unsteady state solutions for confined, unconfined and leaky aquifers, effect of boundaries, method of images, pumping test analysis. Geophysical methods in ground water exploration, Open wells or dug wells, Tubewells.

Module III (12 hours)

Groundwater Flow Modelling: Role of groundwater flow models, basic introduction to hydraulic, Hele-Shaw and analog models, introduction to numerical modeling: basics of finite difference techniques, finite difference solution for aquifer flow, basics of finite element techniques, finite element solution for aquifer flow.

Module IV (12 hours)

Groundwater Quality: General problem of contamination of groundwater, sources, remedial and preventive measures, seawater intrusion in coastal aquifers - Saline water intrusion, Relationship between fresh and saline water, Structure of fresh-salt water interface, Control of saline water intrusion

Module V (6 hours)

Groundwater Conservation: Regional groundwater budget; resource assessment; estimation of recharge, Indian practice for artificial recharge, Planning of Groundwater Development: constraints on the development, role of flow models, optimal groundwater development.

Program Elective Course -7**CVEO482T : ELEMENTS OF GEOINFORMATICS****B Tech CVE-VIII****(3 credits — 45 hours) (L-T-P:3-0-0)**

Objectives: This elective course is designed to familiarize the students with the modern tools of Geoinformatics viz., remote sensing (RS) and geographical information system (GIS) which are useful for analysis and interpretation of occurrences on the earth's surface. Satellite remote sensing in optical bands has been introduced in more detail. Foundation of GIS will help the students to go ahead for using this tool in decision making and Bio-physical modelling.

COURSE /LEARNING OUTCOMES**At the end of the course students will be able to:**

CO1: Define the different types of maps, coordinate systems and recognize the importance and ease of surveying using remote sensing. (Understand)

CO2: Classify different types of remote sensing. Students are able to differentiate the various types of remote sensing data. (Understand)

CO3: Demonstrate the various methods of digital analysis and interpretation of satellite image. (Apply)

CO4: Identify the hardware and software requirements for GIS analysis, organize the data obtained from various remote sensing sources to formulate the map of an area and utilize the same for various planning and other related works.(Apply)

Module I: Basics of Geoinformatics (8 hours)

Map basics: Definition of map and fundamental characteristics, types of map, scale of a map and its representations, map projection – meaning, types and characteristics of each

Coordinates system: geoid and reference ellipsoid, geographic coordinate system - projected coordinate, DEM - meaning and use, geo-referencing of map and image - its meaning and necessity, global positioning system (GPS) - important features and use.

Global Navigation Satellite System: Radio and Satellite Navigation, GNSS Position Location Principles, GNSS system architecture-Satellite constellation, Geo-positioning-Basic Concepts, GNSS Receiver Operation and Differential GPS. NAVSTAR, GLONASS, Indian Geodetic System, GNSS applications: Defense, civilian, Navigational and Geodetic applications; GPS-GIS integration, GNSS applications in surveying, mapping, GNSS in intelligent transportation, fleet management and tracking, Location Based Services, Vehicle- Geo-Locking.

Module II: Foundation of remote sensing (10 hours)

Remote sensing system, passive and active remote sensing, electromagnetic spectrum, atmospheric window, relevant radiation principles, interaction of EMR with atmosphere and earth surface features, spectral signature, atmospheric and geometric influence of spectral response patterns

Data acquisition and visual interpretation: types of satellites, characteristic differences of optical and microwave data, multi-spectral and hyper-spectral data, data acquisition in optical bands - along track and

across track scanning, examples of LANDSAT, SPOT and IRS, data acquisition in microwave bands, advantages and limitations - salient features of few satellites with microwave sensors such as RISAT, ERS etc., types of multi- spectral data products, hard copy and digital image (panchromatic, true colour and FCC etc.) visual interpretation of image - important keys, ground truth verification

Module III: Digital analysis and interpretation of satellite image (17 hours)

Introduction to the broad types of computers assisted operators.

Image rectification and restoration - geometric correction, resampling using nearest neighbour, bilinear interpolation and cubic convolution, radiometric correction due to sun elevation and earth-sun distance, noise removal.

Image enhancements – level slicing, contrast stretching, spatial filtering, convolution, edge enhancements, and spectral ratios, vegetation indices.

Image classification - supervised, unsupervised and hybrid.

Module IV: Introduction to geographic information system (GIS) (10 hours)

Definition of GIS, comparison of GIS with CAD, GIS architecture, components of a GIS – hardware, software, data, people, methods, GIS data type – spatial and attribute, spatial data types – point, line and polygon, raster and vector representation of data GIS workflow diagram with explanation, fundamental operation of GIS, application of GIS – few examples

2. CVEG483T : ENVIRONMENTAL GEOTECHNOLOGY

B Tech CVE-VIII

4 Credits : 60 Hours (L:T:P-3:0:0)

Course Objectives:

The main objectives of this course are:

To understand the soil-environment interaction, Soil mineralogy and Mechanisms of soil-water interaction

To learn ground water flow and contaminant transport phenomenon.

To Learn about the principles and practices of waste management, including the design and construction of landfills, hazardous waste containment systems, and other waste disposal methods.

Course Outcomes:

After Successful completion of the course students will be able to:

CO1: Understand Soil-environment interaction, Soil mineralogy and Mechanism of soil-water interaction (Understand)

CO2: Demonstrate a thorough understanding of the physical, chemical, and biological processes that govern the behavior and transport of contaminants in soil and groundwater. (Apply)

CO3: Apply principles of geotechnical engineering to design effective waste management systems, including landfills and hazardous waste containment systems. (Apply)

CO4: Select and implement appropriate remediation technologies for various types of contaminated sites, assessing their effectiveness and limitations. (Apply)

Syllabus:

Module I:(8 hours)

Introduction to Geo Environmental Engineering., Sources & Impact of Contamination and Soil-Waste Interaction

Concepts of Integrated SWM & Geoenvironmental Engineering.

Module II:(7 Hours)

Concepts of waste containment; Sources, production and classification of wastes, Environmental laws and regulations, ground water flow and contaminant transport, desirable properties of soil; contaminant transport and retention; contaminated site remediation.

Module II:(15 Hours)

Mechanisms of soil-water interaction: Diffuse double layer models; Force of attraction and repulsion; Soil-water-contaminant interaction; Theories of ion exchange; Influence of organic and inorganic chemical interaction

Principles and Planning of Landfills, Liners for Landfills, Land-fill Covers, Generation and Control of Leachate and Gas from Landfills, Stability of Slopes and Settlement of Landfills

Module III: (15 Hours)

Contaminant analysis. Contaminated site characterization, estimation of landfill quantities, landfill site location, design of various landfill components such as liners, covers, leachate collection and removal, gas generation and management, ground water monitoring, end uses of landfill sites.

Solved examples, Monitoring and Detection of Subsurface Contamination, Costs, Construction Aspects and Site Selection of Landfills. Control, Rehabilitation of Old Dumps and Contaminated Sites.

Module IV: (15 Hours)

Slurry Deposited Waste and their Geotechnical Properties .Planning & Design, Incremental Raisings and Failures of Slurry Ponds ,slurry walls and barrier systems, design and construction, stability, compatibility and performance, remediation technologies, stabilization of contaminated soils and risk assessment approaches. Environmental Control Measures at Slurry Ponds, Geotechnical Reuse of Waste

3. CVPS484T: Prestressed Concrete

B Tech CVE-VIII

(3 credits – 45 hours) (L-T-P: 3-0-0)

Objectives

The course aims to give students a thorough grasp of the principles and techniques used in designing and analyzing prestressed concrete systems. By the end of the course, students will possess the essential knowledge and skills to proficiently design and analyze prestressed concrete structures, readying them for professional careers in civil and structural engineering.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

CO1.Analyze and explain the fundamental concepts and principles of prestressed concrete, including the materials and prestressing systems used. (Analyzing)

CO2.Analyze and design prestressed flexural members, ensuring compliance with limit states of collapse, serviceability, shear, and torsion.(Creating)

CO3.Calculate deflection and crack width to evaluate the serviceability of prestressed concrete structures under different loading conditions.(Evaluating)

CO4.Analyze prestress transmission in anchorage zones and design the end blocks accordingly. (Analyzing/Creating)

CO5. Analyze and design composite members and statically indeterminate structures.(Analyzing/Creating)

Detailed Syllabus:

Module I: 5 hours

Basic concept and principles of pre-stressed concrete, materials, prestressing systems – Analysis of prestress and bending stresses loss of pre-stress Stresses at transfer and service loads.

Module II: 8 hours

Limit state design criteria: Inadequacy of elastic and ultimate load method, criteria for limit states, strength and serviceability. Design of sections for flexure codal provisions- ultimate strength in flexure.

Module III: 8 hours

Shear and torsional resistance: design of shear reinforcement, design of reinforcement for torsion, shear and bending..

Module IV: 8 hours

Deflections of prestressed concrete members: Importance, factors, short term and long term deflection. Codal provisions.

Module V:8 hours

Anchorage Zone stresses in post tensioned members: Stress distribution in end block, anchorage zone reinforcement. Prestressed concrete poles and sleepers: Design of sections for compression and bending. Partial pre-stressing- Definitions, principles and design approaches and applications.

Module VI:8 hours

Composite beams –Analysis and design – Ultimate strength – applications, Elementary idea of composite construction for tee beams in bridges.Statically Indeterminate structures: advantages of continuous member(Concepts and steps for analysis)

Open Elective course 1**CVCM346T: CONCRETE MATERIALS****(3 Credits -45 hours-L:T:P- 3:0:0)****Objectives:**

The course aims to provide students with a comprehensive understanding and practical skills in concrete technology, focusing on influence of constituent materials on concrete properties, Implementing specialized concrete mixes and concrete handling, placement, and testing techniques through laboratory practice.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Evaluate materials' impact on concrete properties and performance. (Evaluate)

CO2: Design advanced concrete mixes using specialized materials. (Create)

CO3: Examine the concrete tests under various conditions. (Analyze)

Syllabus:**Module I: Influence of Materials (12 hours)**

Examines the influence of constituent materials (cements, aggregates and admixtures) on the properties of fresh and hardened concrete, recycled aggregates recovered from construction and demolition wastes, m-sand, light-weight aggregates.

Module II: Advanced and Specialized Concrete Mixes (13 hours)

Use of fly ash in concrete, fibre-reinforced concrete with various types of metallic and non-metallic fibres, various types of concrete such as self-compacting concrete, high performance concrete, etc.

Module II: Comprehensive Concrete Technology (20 hours)

Mix design, handling and placement of concrete, effect of revibration of concrete, behavior of concrete under various types of loading and environment, various laboratory test methods.

Suggested Readings:

Open Elective course 2**CVSC358T: Sustainable construction methods****B Tech CVE -VI****(3 credits – 45 hours) (3L-0T-0P)**

Objectives

This course introduces the concepts of sustainability in civil engineering and explores the role construction materials play in developing green infrastructure.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

1. Classify sustainable construction materials. (Understand)
2. Apply cutting-edge construction technologies. (Apply)
3. Apply different rating systems of construction/buildings as a professional. (Apply)
4. Apply life cycle approach to optimize the performance of green construction materials. (Apply)

Module I: 5 hours

Types of foundations and construction methods. Basics of Formwork and Staging. Common building construction methods (conventional walls and slabs; conventional framed structure with blockwork walls). Modular construction methods for repetitive works.

Module II: 10 hours

Precast concrete construction methods. Basics of Slip forming for tall structures. Basic construction methods for steel structures. Basics of construction methods for Bridges.

Module III: 10 hours

Identification of cutting-edge sustainable construction materials, technologies and project management strategies for use in the construction industry and evaluation of their potential to reduce the negative environmental impacts of construction activity.

Module IV: 10 hours

Study and evaluation of current Leadership in Energy and Environmental Design (LEED) and Green Rating for Integrated Habitat Assessment (GRIHA) for construction system. Detailed case study and analysis of highly successful recent "green construction projects". Guidance for students on the LEED Green Associate professional licensing examination.

Module V: 10 hours

Environmental impact of materials; life-cycle assessment; material selection to optimize performance; design, evaluation, and production of green construction materials.

.Open Elective 3**CVRR472T: Repair & Rehabilitation of Structures****B Tech CVE -7**

3 credits-45 Hours (L:T:P:3:0:0)

Objectives:

1. To provide a thorough understanding of the fundamental principles of structural deterioration and the various factors that contribute to it.
2. To develop the ability to perform detailed assessments of structural conditions using a variety of diagnostic tools and techniques.
3. To impart knowledge about the properties, advantages, and limitations of different materials used in repair and rehabilitation.
4. To teach various repair and strengthening techniques, including both traditional methods and modern innovations.

Course outcomes:

CO1. Identify the causes and mechanisms of structural deterioration, including environmental, chemical, physical, and mechanical factors. (Understand)

CO2. Achieve the knowledge on quality of concrete, durability aspects, causes of deterioration, and assessment of distressed structures by different NDT methods. (Understand)

CO3. Understand the properties and applications of various repair materials, such as concrete repair mortars, grouts, epoxy resins, and fiber-reinforced polymers. (Understand)

CO4. Supervise and manage repair projects to ensure quality control and adherence to safety standards. (Apply)

Module I :(10 hours)

Maintenance and Repair Strategies Maintenance, Repair and Rehabilitation, Facets of Maintenance, importance of Maintenance, Various aspects of Inspection, Assessment procedure for evaluating a damaged structure, and causes of deterioration.

Module II :(20 hours)

Strength and Durability Of Concrete- Quality assurance for concrete – Strength, Durability and Thermal properties, of concrete – Cracks, different types, causes – Effects due to climate, temperature, Sustained elevated temperature, Corrosion – Effects of cover thickness; Special Concretes- Polymer concrete, Sulphur infiltrated concrete, Fibre reinforced concrete, High strength concrete, High-performance concrete, Vacuum concrete, Self-compacting concrete, Geopolymer concrete, Reactive powder concrete, Concrete made with industrial wastes; Techniques for Repair and Protection Methods- Non-destructive Testing Techniques, Epoxy injection, Shoring, Underpinning, Corrosion protection techniques – Corrosion inhibitors, Corrosion resistant steels, Coatings to reinforcement, cathodic protection;

Module III: (15 hours)

Repair, Rehabilitation and Retrofitting of Structures- Evaluation of root causes; Underpinning & shoring; some simple systems of rehabilitation of structures; Guniting, shotcreting; Non-Destructive testing systems; Use of external plates, carbon fibre wrapping and carbon composites in repairs. Strengthening of Structural elements, Repair of structures distressed due to corrosion, fire, Leakage, earthquake – Demolition Techniques – Engineered demolition methods – Case studies.

Open Elective 4**CVIT485T: Introduction to Finite Element Analysis****3 Credits -45 Hours-(3-0-0=3 credits)****Course Objectives**

To understand the basic concepts and mathematical methods required for finite element analysis

To apply direct stiffness method in analysis of truss and frames

To develop finite element formulation using one dimensional element and find solution

To develop finite element procedure using two-dimensional element and application to engineering problems

Course Outcome

At the end of the course students will be able to

CO1: Understand basic concepts and mathematical methods required in finite element analysis(Understand)**CO2:** Use direct stiffness method in truss and frame analysis(Apply)**CO3:** Develop finite element procedure using one dimensional bar element and beam element(Create)**CO4:** Formulate finite element procedure in plane stress problem using 2D element (Apply)**Module 1: Fundamental Concepts (8 hours)**

Introduction, historical background, matrix algebra, stresses in elastic body and equilibrium, strain-displacement, stress-strain relations, constitutive matrix, plane stress and plane strain condition, Potential energy, virtual work principle, Rayleigh-Ritz method, Galerkin method, application to axially loaded element and member under bending.

Module 2: Direct stiffness method (12 Hours)

Basic concepts, merits and demerits, kinematic indeterminacy, identification of member and node in structures, global and member co-ordinates, one dimensional member -axially loaded, transverse loading, displacement and force transformation matrix, element stiffness matrix, assembly procedure, illustration in plane truss, continuous beams and frames, computer programme for generating global stiffness matrix, load vector and finding displacement

Module 3: One dimensional problem (15 Hours)

Finite element model, element division and numbering scheme shape function, local co-ordinates, assembly of the global stiffness matrix and load vector, properties of stiffness matrix, application of boundary conditions, quadratic and cubic shape function, stiffness matrix of Euler Bernouli beam element, Problems involving plane frames, use of MATLAB in solving problems.

Module 4: Two dimensional analysis (10 Hours)

Discretization, 2D three noded triangular element, convergence criteria, displacement function in terms of nodal co-ordinates, element stiffness matrix, plane stress problems, Four noded rectangular element, strain-nodal displacement relation, element stiffness matrix, concept of isoparametric element, transformation from physical to isoparametric co-ordinates for the linear element, Gaussian quadrature formula and application.

Mandatory -Non credit Audit Course (From Department of Civil Engineering)**1. CVCE232T :Civil Engineering - Societal & Global Impact****B Tech CVE- IV****P/NP: [L-T-P: 3:0:0]**

The course is designed to provide a better understanding of the impact which Civil Engineering has on the Society at large and on the global arena.

Course Outcomes:

After successful completion of the course students will be able to understand :

CO1 - Relate the impact which Civil Engineering projects have on the Society at large and on the global arena. (Analysing)

CO2 - Compare the past, present and future of the Built Environment and factors impacting the Quality of Life(Understanding)

CO3 - Recognize the extent of Infrastructure, its requirements for energy and how they are met(Understanding)

CO4 - Apply professional and responsible judgement and take a leadership role(Applying)

CO5 - Examine the potential of Civil Engineering for Employment creation and its Contribution to the GDP(Analysing)

Detailed Syllabus

Module 1: Introduction to Course and Overview; Understanding the past to look into the future:

Pre-industrial revolution days, Agricultural revolution, first and second industrial revolutions, IT revolution; Recent major Civil Engineering breakthroughs and innovations; Present day world and future projections, Ecosystems in Society and in Nature; the steady erosion in Sustainability; Global warming, its impact and possible causes; Evaluating future requirements for various resources; GIS and applications for monitoring systems; Human Development Index and Ecological Footprint of India Vs other countries and analysis;

Module 2: Understanding the importance of Civil Engineering in shaping and impacting the world; The ancient and modern Marvels and Wonders in the field of Civil Engineering; Future Vision for Civil Engineering

Module 3: Infrastructure - Habitats, Megacities, Smart Cities, futuristic visions; Transportation (Roads, Railways & Metros, Airports, Seaports, River ways, Sea canals, Tunnels (below ground, under water); Futuristic systems (ex, Hyper Loop)); Energy generation (Hydro, Solar (Photovoltaic, Solar Chimney), Wind, Wave, Tidal, Geothermal, Thermal energy); Water provisioning; Telecommunication needs (towers, above-ground and underground cabling); Awareness of various Codes & Standards governing Infrastructure development; Innovations and methodologies for ensuring Sustainability;

Module 4: Environment- Traditional & futuristic methods; Solid waste management, Water purification, Wastewater treatment & Recycling, Hazardous waste treatment; Flood control(Dams, Canals, River interlinking), multi-purpose water projects, Atmospheric pollution; Global warming phenomena and Pollution Mitigation measures, Stationarity and nonstationarity; Environmental Metrics & Monitoring; Other Sustainability measures;Innovations and methodologies for ensuring Sustainability.

Module 5: Built environment – Facilities management, Climate control; Energy efficient built environments and LEED ratings, Recycling, Temperature/ Sound control in built environment, Security systems; Intelligent/ Smart Buildings; Aesthetics of built environment, Role of Urban Arts Commissions; Conservation, Repairs & Rehabilitation of Structures & Heritage structures; Innovations and methodologies for ensuring Sustainability

Module 6: Civil Engineering Projects – Environmental Impact Analysis procedures; Waste (materials, manpower, equipment) avoidance/ Efficiency increase; Advanced construction techniques for better sustainability; Techniques for reduction of Green House Gas emissions in various aspects of Civil Engineering Projects; New Project Management paradigms & Systems (Ex. Lean Construction), contribution of Civil Engineering to GDP, Contribution to employment(projects, facilities management), Quality of products, Health & Safety aspects for stakeholders; Innovations and methodologies for ensuring Sustainability during Project development;

2.CVPP349T: Professional Practice, Law & Ethics B Tech CVE-V

(P/NP) [L-T-P: 3:0:0]

Course Objectives:

The course is designed to address the following:

The course covers professional relations, civic responsibilities, and ethical obligations for engineering practice. The course will make the students understand contracts management and various legal aspects related to engineering. Further, the course familiarizes students with elementary knowledge of laws that would be of utility in their profession, including several new areas of law such as IPR, ADR. The course is designed to address the following:

To make the students understand the types of roles they are expected to play in the society as practitioners of the civil engineering profession and to develop some ideas of the legal and practical aspects of their profession.

Course Outcomes

At the end of the course students will be able to

CO1 - Identify what constitutes professional practice and the fundamental ethics governing the profession

CO2 - Compare the roles of various stakeholders in civil engineering projects

CO3 - Compare the different contracts and their management in civil engineering

CO4 - Recognize different dispute resolution mechanisms; laws governing engagement of labour and Intellectual Property Rights, Patents

CO5 - Interpret the role students are expected to play in the society as practitioners of the civil engineering profession

Proposed Syllabus :

Module I:(5 Hours)

Professional Ethics – Definition of Ethics, Professional Ethics, Business Ethics, Corporate Ethics, Engineering Ethics, Personal Ethics; Code of Ethics as defined in the website of Institution of Engineers (India); Profession, Professionalism, Professional Responsibility, Professional Ethics; Conflict of Interest, Gift Vs Bribery, Environmental breaches, Negligence, Deficiencies in state-of-the-art; Vigil Mechanism, Whistleblowing, protected disclosures.

Module II:(8 Hours)

Professional Practice – Respective roles of various stakeholders: Government (constituting regulatory bodies and standardization organizations, prescribing norms to ensure safety of the citizens); Standardization Bodies (ex. BIS, IRC)(formulating standards of practice); professional bodies (ex. Institution of Engineers(India), Indian Roads Congress, IIA/ COA, ECI, Local Bodies/ Planning Authorities) (certifying professionals and offering platforms for interaction); Clients/ owners (role governed by contracts); Developers (role governed by regulations such as RERA); Consultants (role governed by bodies such as CEAI); Contractors (role governed by contracts and regulatory Acts and Standards); Manufacturers/ Vendors/Service agencies (role governed by contracts and regulatory Acts and Standards)

Module III: (10 Hours)

General Principles of Contracts Management: Indian Contract Act, 1972 and amendments covering General principles of contracting; Contract Formation & Law; Privacy of contract; Various types of contract and their features; Valid & Voidable Contracts; Prime and sub-contracts; Joint Ventures & Consortium; Complex contract terminology; Tenders, Request For Proposals, Bids & Proposals; Bid Evaluation; Contract Conditions & Specifications; Critical /“ Red Flag” conditions; Contract award & Notice To Proceed; Variations & Changes in Contracts; Differing site conditions; Cost escalation; Delays, Suspensions & Terminations; Time extensions & Force Majeure; Delay Analysis; Liquidated damages & Penalties; Insurance & Taxation; Performance and Excusable Non-performance; Contract documentation; Contract Notices; Wrong practices in contracting (Bid shopping, Bid fixing, Cartels); Reverse auction; Case Studies; Build-Own-Operate & variations; Public - Private Partnerships; International Commercial Terms;

Module IV :(10 Hours)

Arbitration, Conciliation and ADR (Alternative Dispute Resolution) system: Arbitration – meaning, scope and types – distinction between laws of 1940 and 1996; UNCITRAL model law – Arbitration and expert determination; Extent of judicial intervention; International commercial arbitration; Arbitration agreements – essential and kinds, validity, reference and interim measures by court; Arbitration tribunal – appointment, challenge, jurisdiction of arbitral tribunal, powers, grounds of challenge, procedure and court assistance; Award including Form and content, Grounds for setting aside an award, Enforcement, Appeal and Revision; Enforcement of foreign awards – New York and Geneva Convention Awards; Distinction between conciliation, negotiation, mediation and arbitration, confidentiality, resort to judicial proceedings, costs; Dispute Resolution Boards; Lok Adalats

Module V: (4 Hours)

Engagement of Labour and Labour & other construction-related Laws: Role of Labour in Civil Engineering; Methods of engaging labour- on rolls, labour sub-contract, piece rate work; Industrial Disputes Act, 1947; Collective bargaining; Industrial Employment (Standing Orders) Act, 1946; Workmen's Compensation Act, 1923; Building & Other Construction Workers (regulation of employment and conditions of service) Act (1996) and Rules (1998); RERA Act 2017, NBC 2017

Module VI: (8 Hours)

Law relating to Intellectual property: Introduction – meaning of intellectual property, main forms of IP, Copyright, Trademarks, Patents and Designs, Secrets; Law relating to Copyright in India including Historical evolution of Copy Rights Act, 1957, Meaning of copyright – computer programs, Ownership of copyrights and assignment, Criteria of infringement, Piracy in Internet – Remedies and procedures in India; Law relating to Patents

under Patents Act, 1970 including Concept and historical perspective of patents law in India, Patentable inventions with special reference to biotechnology products, Patent protection for computer programs, Process of obtaining patent – application, examination, opposition and sealing of patents, Patent cooperation treaty and grounds for opposition, Rights and obligations of patentee, Duration of patents – law and policy considerations, Infringement and related remedies;

3. CVDP475T: Disaster Preparedness & Planning

B Tech CVE -VII

3 Credits - (L:T:P:3:0:0)

Objectives: *The objectives of the course are to understand basic concepts in Disaster Management , definitions and terminologies used in Disaster Management, types and Categories of Disasters, the Challenges posed by Disasters and the Impacts of Disasters Key Skills*

COURSE/LEARNING OUTCOMES

Upon successful completion of the course, the students will be able to:

- CO1:** Summarize the application of Disaster Concepts to Management (Understand)
- CO2:** Relate Development and Disasters. (Understand)
- CO3:** Make use of the understanding of different categories of Disasters (Apply)
- CO4:** Develop realization that they have responsibilities to society(Apply)

Module I: 2 Hours

Introduction - Concepts and definitions: disaster, hazard, vulnerability, risks- severity, frequency and details, capacity, impact, prevention, mitigation).

Module II: 8 Hours

Disasters - Disasters classification; natural disasters (floods, draught, cyclones, volcanoes, earthquakes, tsunami, landslides, coastal erosion, soil erosion, forest fires etc.); man made disasters (industrial pollution, artificial flooding in urban areas, nuclear radiation, chemical spills, transportation accidents, terrorist strikes, etc.); hazard and vulnerability profile of India, mountain and coastal areas, ecological fragility.

Module III: 8 Hours

Disaster Impacts - Disaster impacts (environmental, physical, social, ecological, economic, political, etc.); health, psycho-social issues; demographic aspects (gender, age, special needs); hazard locations; global and national disaster trends; climate change and urban disasters.

Module IV: 10 Hours

Disaster Risk Reduction (DRR) - Disaster management cycle – its phases; prevention, mitigation, preparedness, relief and recovery; structural and non-structural measures; risk analysis, vulnerability and capacity assessment; early warning systems, Post- disaster environmental response (water, sanitation, food safety, waste management, disease control, security, communications); Roles and responsibilities of government, community, local institutions, NGOs and other stakeholders; Policies and legislation for disaster risk reduction, DRR programs in India and the activities of National Disaster Management Authority.

Module V: 5 Hours

Disasters, Environment and Development - Factors affecting vulnerability such as impact of developmental projects and environmental modifications (including of dams, land- use changes, urbanization etc.), sustainable and environmentally friendly recovery; reconstruction and development methods.

LABORATORY COURSES**CVGD100T:ENGINEERING GRAPHICS AND DESIGN/ ENGINEERING GRAPHICS & DESIGN LAB**

3 Credits-1L: 0 T: 4P

COURSE OBJECTIVES: *The objective of this course is to teach the basics of engineering drawing and drafting to students by free hand sketching as well as computer aided design.*

COURSE/LEARNING OUTCOMES

After completing the course students will be able to:

CO1: Learn to draw letters, scales and curves (Understanding)

CO2: Learn to draw projection of points, lines, scales and solids(Understanding)

CO3: Learn to draw isometric projection of solids(Applying)

CO4: Learn the functionalities and application of AutoCAD software(Understanding)

Syllabus**Module I: (10 hours)**

Principles of Engineering Graphics and their significance, usage of Drawing instruments, lettering, Scales – Plain, Diagonal and Vernier Scales, Conic sections including the Rectangular Hyperbola (General method only), Cycloid, Epicycloid, Hypocycloid and Involute.

ModuleII:(15hours)

Principles of Orthographic Projections-Conventions - Projections of Points and lines inclined to both planes; Projections of planes inclined Planes - Auxiliary Planes, Projections of Regular Solids: Solids inclined to both the Planes- Auxiliary Views, simple annotation, dimensioning and scale, Sections and Sectional Views

of Right Angular Solids: Prism, Cylinder, Pyramid, Cone – Auxiliary Views, development of surfaces of Right Regular Solids - Prism, Pyramid, Cylinder and Cone, sectional orthographic views of geometrical solids.

Module III: (5 hours)

Principles of Isometric projection – Isometric Scale, Isometric Views, Conventions, Isometric Views of lines, Planes, Simple and compound Solids, Conversion of Isometric Views to Orthographic Views and Vice-versa.

Module IV: (15 hours)

Demonstrating knowledge of the theory of CAD software such as the Menu System, Toolbars (Standard, Object Properties, Draw, Modify and Dimension), Drawing Area (Background, Crosshairs, Coordinate System), Dialog boxes and windows, Shortcut menus (Button Bars), The Command Line (where applicable), The Status Bar, Different methods of zoom as used in CAD, Select and erase objects.; Isometric Views of lines, Planes, Simple and compound Solids, set up of the drawing page and the printer, including scale settings, setting up of units and drawing limits; ISO and ANSI standards for coordinate dimensioning and tolerance; Orthographic constraints, Snap to objects manually and automatically, producing drawings by using various coordinate input entry methods to draw straight lines, Applying various ways of drawing circles, Annotations, layering and other functions to create drawings, create, edit and use customized layers; changing line lengths through modifying existing lines (extend/lengthen); Printing documents to paper using the print command; orthographic projection techniques.

CVIT190P: Introduction to Construction Techniques & Material Testing Lab

1 Credit:0L:0T:2P

Objectives:

This course aims to introduce students to basic construction materials and standard material testing procedures. It familiarizes them with essential laboratory equipment, helps them perform key tests as per IS codes, and enables them to analyze results to assess material quality while developing good laboratory practices.

Course Outcomes (COs)

After successful completion of the laboratory course, students will be able to:

CO1: Identify, handle, and operate basic material testing equipment such as UTM, CTM, and Proctor apparatus used in construction materials testing. (Linked to Practicals: 1, 2, 3, 4, 7)

CO2: Conduct standard laboratory tests on cement, fine aggregates, coarse aggregates, bricks, water, and concrete and follow the relevant IS codes and procedures. (Practicals: 1, 3, 4, 5, 6, 7)

CO3: Analyze and interpret test results to determine material properties such as strength, consistency, fineness, workability, durability indicators, and compliance with engineering standards (Linked to Practicals: 1, 3, 4, 5, 6, 7)

CO4: Compare test outcomes with IS specifications to assess the suitability and quality of construction materials for civil engineering applications. (Linked to Practicals: 1, 3, 4, 5, 6, 7)

CO5: Document experimental procedures, record observations accurately, and prepare structured laboratory reports with conclusions based on test results. *(Linked to all practicals)*

List of Practical

Seive analysis of fine aggregate

Introduction to:

Universal Testing machine
 Compression testing machine
 Standard Proctor test
 3.Test on Cement
 Fineness
 Consistency
 Soundness
 Initial setting time and final setting time
 4.Tests on coarse Aggregate
 Impact test
 Crushing test
 Water absorption test
 Abrasion test
 5.Tests on Water
 pH Value
 Total Solids
 6.Tests on Bricks
 Water absorption
 Compressive Strength
 7.Tests on Concrete
 Workability of concrete
 Compressive Strength of concrete
 Split tensile strength of concrete

CVBP201P: Building Planning and Computer-aided Civil Engineering drawing-Lab

B.Tech-CVE 3

3 credits: (0L: 2T:2P)

Objectives:

The objectives of the course can be summarized in the following three points:

Equip students with the ability to apply the fundamental principles of building planning and design.

Enable students to proficiently use computer-aided design (CAD) tools to prepare detailed constructional plans, elevations, sections, and layout plans.

Teach students to plan and design essential building services, including water supply and drainage systems, solid waste collection and disposal, electrical services, fire protection systems, HVAC (heating, ventilation, and air conditioning), elevators, and building management systems.

Course outcomes:

After completion of course, students will be able to
 Implement principles of planning of buildings. (Applying)
 Design and draw various constructional drawing of the buildings. (Creating)
 Plan various building services. (Analysing)

Syllabus:**Planning of Building: -**

Preparation of constructional details and drawings-plan, elevation, section, site plan, foundation plan, terrace plan, waterproofing treatment, typical door and window. Planning of building such as:

Residential building - Load bearing structure, RCC framed structure. Building for Education – school, college. Library

Building for health - Dispensary, Hospital Industrial structure

Building for entertainment -Theatre, club house, sports club. Other structure-Office, Hostel, Guest house.

Essential Components of Infrastructure:

Building's Water Supply and Drainage & Solid Waste Collection and Disposal System; Electrical Services; Fire Protection System; Elevators; Heating Ventilation and Air Conditioning; Building Management System.

List of experiments/assignments:

Preparation of detailed constructional plan of a residential building.

Preparation of front elevation, detailed sectional view, site plan, foundation plan, terrace plan, waterproofing treatment, typical door and window.

Preparation of line plans of various public buildings like: Building for Education – School, College. Library

Building for health – Dispensary, Hospital Industrial structure; Building for entertainment- Theatre, Club House, Sports Club; Other Structure- Office, Hostel, Guest house etc.

Prepare layout for water supply and drainage for a residential building and for multistoried buildings.

Building's Solid Waste Collection and disposal system: Wet and dry solid waste segregation, Vermicomposting etc.

Fire Protection System: Design of emergency exits and emergency vehicle routes with fire protection symbols

CVCE202P: CIVIL ENGINEERING MATERIALS AND CONCRETE TECHNOLOGY LAB**B.Tech-CVE 3****1 credits (0L:0T-2P)****Objective:**

The objective of this course is to familiarize the students with physical properties and mechanical behaviour of concrete and related construction materials.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

Distinguish the characteristics of fine aggregates and coarse aggregates for preparation of concrete mix. (Analysing)

Determine the important properties of cement and concrete in fresh and hardened state. (Analysing)

List of Experiments:

- To determine Fineness modulus of fine and coarse aggregate by sieve analysis.
- To determine bulk density of fine and coarse aggregates.
- To determine specific gravity and water absorption of fine and coarse aggregates.
- To determine bulking of sand.
- To determine fineness of cement by sieving.
- To determine soundness, standard consistency, initial and final Setting times of cement.
- To determine compressive strength of cement.
- To determine workability of concrete by slump cone test.
- To determine workability of concrete by compaction factor test.
- To determine workability of concrete by Vee Bee Test.
- To determine workability of concrete by Flow Table test
- To prepare concrete mix of a particular grade and determine compressive strength of concrete for 7 and 28 days.
- To demonstrate NDT equipment and related experiments.

CVFM203P :FLUID MECHANICS LAB**(1 Credit)****Objectives**

To enrich the concept of fluid mechanics.

To demonstrate the classical experiments in fluid mechanics.

To demonstrate the applications of the basic fluid mechanics principles.

To provide a more intuitive and physical understanding of the fluid mechanics theory.

Course/ Learning Outcomes

At the end of this course students will be able to:

1. Explain the stability of floating bodies and calculate hydrostatic pressure on curved surfaces. (*understand, apply*)
2. Verify Bernoulli's theorem. (*evaluate*)
3. Determine the Coefficient of discharge for various flow meters and the impact of jet on vanes. (*evaluate*)
4. Visualize fluid flow and calculate Reynold's number. (*understand*)

List of Experiments

1. Hydrostatics Force on Flat Surfaces/Curved Surfaces.
2. Stability of Floating Body.
3. Verification of Bernoulli's Theorem.
4. Venturimeter.
5. Orifice meter.
6. Impacts of jets.
7. Reynold's experiment.

CVTE227P: TRANSPORTATION ENGINEERING LAB

1 credit

COURSE/LEARNING OUTCOMES

After successfully studying this course, students will be able to:

CO1: Summarize engineering properties of aggregates. (Understanding)

CO2: Calculate the engineering properties of soil. (Applying)

CO3: Identify the grade & properties of bitumen. (Understanding)

List of Experiments

1. To determine the IMPACT VALUE of coarse aggregates by use of IMPACT MACHINE.
2. To determine the ABRASION VALUE of coarse aggregates by use of LOS ANGELES MACHINE.
3. To determine the Flakiness Index and Elongation Index of coarse aggregates.
4. To determine the MARSHALL STABILITY of Bitumen mix.
5. To determine the SOFTENING POINT of Bitumen.
6. To determine the DUCTILITY of Bitumen.
7. To determine the Specific Gravity of Bitumen.
8. To determine the Penetration of Bitumen.
9. To determine the CALIFORNIA BEARING RATIO of soil.

CVSA228P :SURVEYING AND GEOMATICS LABORATORY**(1 credit – 15 hours) (0L:0T:2P)****OBJECTIVES:**

1. Acquire practical knowledge on handling survey instruments like Theodolite – to measure horizontal, vertical angles, calculation of area and elevation of ground surface.
2. Acquire adequate knowledge to carryout Triangulation, understand the importance of Triangulation and their applications in surveying
3. Tacheometry - to identify the elevation and horizontal distance between instrument and object
4. Acquire practical knowledge on handling survey instruments like Total station including general field marking for various engineering projects
5. At the end of the course the student will possess knowledge about Survey field techniques.

COURSE OUTCOMES:

At the end of the course student will be able to:

CO1: Develop proficiency in using various surveying instruments such as theodolites, total stations, GPS devices, and levels, and demonstrate the ability to set up, calibrate, and operate these instruments accurately. (Applying)

CO2: Apply proper techniques for measuring distances, angles, and elevations, conduct precise and accurate field measurements using traditional and modern surveying equipment. (creating)

CO3: Collect field data efficiently and effectively. Process and analyze survey data using relevant software and tools. Understand the principles of data accuracy, error reduction, and adjustment techniques. (creating)

CO4: Create detailed maps and plans from survey data.(creating)

LIST OF EXPERIMENTS:**Exp 1: Chain survey:**

1. Study of chains and its accessories, Aligning, Ranging, Chaining and Marking Perpendicular offset
2. Setting out works – Foundation marking using tapes single Room and Double Room

Exp 2: Traversing

1. Compass Traversing – Measuring Bearings & arriving included angles
2. Plane table Traversing

Exp 3: Levelling - study of levels and levelling staff

1. Fly levelling using Dumpy level & Tilting level
2. Check levelling

Exp 4: Theodolite - study of theodolite

1. Measurements of horizontal angles by reiteration and repetition and vertical angles

2. Determination of elevation of an object using single plane method when base is accessible/inaccessible
3. Determination of elevation of an object using double plane method

Exp 5: Tacheometry – tangential system – stadia system

1. Determination of Tacheometric Constants
2. Heights and distances by stadia Tacheometry
3. Heights and distances by Tangential Tacheometry

Exp 6: Total station

1. Study of Total Station, Measuring Horizontal and vertical angles
2. Traverse using Total station and Area of Traverse
3. Determination of distance and difference in elevation between two inaccessible points using Total station.

CVGE229P: Geotechnical Engineering Lab**(1 credit – 15 hours) (0L:0T:2P)****COURSE / LEARNING OUTCOMES**

At the end of the course student will be able to:

- CO 1.** Explain the purpose of each soil test and what it measures. (Understanding)
CO 2. Use laboratory equipment to measure soil properties. (Applying)
CO3. Interpret the results of soil tests to determine soil characteristics. (Analyzing)
CO4. Assess the reliability and accuracy of test results. (Evaluating)

List of Experiments

1. Field Density using Core Cutter method and Sand replacement method.
2. Natural moisture content using Oven Drying method.
3. Field identification of Fine-Grained soils.
4. Specific gravity of Soils.
5. Grain size distribution by Sieve Analysis and Hydrometer Analysis.
6. Consistency limits- Liquid limit, Plastic limit and Shrinkage limit.
7. Permeability test using Constant-head test method. and the Falling-head method.
8. Compaction test: Standard Proctor test and Modified Proctor test.
9. Relative density.
10. Consolidation Test.
11. Triaxial Test (UU).
12. Vane shear test.
13. Direct Shear Test.
14. Unconfined Compression Strength Test.

CVHE230P: HYDRAULIC ENGINEERING LAB**(1 Credit)****Objectives***To explore the fundamental principles of hydraulic engineering through experimentation.**To investigate engineering principles for pipe networks and open channel systems.**To expose the learners to the principles of hydraulics in flow measurements.***Course/ Learning Outcomes**

At the end of this course students will be able to:

CO1. Determine the head losses for flow through pipes. (*evaluate*)**CO2.** Identify laminar flow and turbulent flow. (*understand*)**CO3.** Calculate coefficient of discharge for notches. (*apply*)**CO4.** Investigate the energy losses associated with a classical hydraulic jump. (*analyze*)**List of Experiments**

1. Major Losses in pipe flow.
2. Minor Losses in pipe flow.
3. Laminar flow through pipes.
4. Turbulent flow through pipes.
5. Flow over weirs and notches.
6. Hydraulic jump

CVSM231P: SOLID MECHANICS & STRUCTURAL ANALYSIS LABORATORY**1 Credits: 0L:0T:2P****Course Outcomes:** Through this course, students should be able to**CO1:** Understand how to represent real structures by idealized structural systems and the deformations of structures under loading.**CO2:** Analyze various statically determinate structures including trusses, beams and frames.**CO3:** Apply various method to determine the deformations.

List of Practical's / Experiments

Clark -Maxwell Theorem: Deflection of a simply supported beam and verification of Clark- Maxwell's theorem.

Elastic property of beam: To verify the elastic property of deflected beam.

Bending moment and shear force: To verify the bending moment and shear force for the simply supported beam.

Moment area theorem: To verify the moment area theorem for a beam.

Behavior of columns: Study of behavior of columns and struts with different end conditions.

Experiment on Curved Beams: To find the deflection of curved beams.

Three hinge arch: To verify the horizontal thrust for three hinge arch.

Two-hinged arch: Experiment on two-hinged arch.

Portal frame: To verify the sway for portal frame.

Redundant frames: To verify Forces in members of Redundant frames.

Suspension Bridge: Demonstration of the characteristics of a simple suspension bridge and examination of the relationship between applied loads and the suspension cable tension.

Recommended Readings:

THEORY OF STRUCTURES by S. RAMAMRUTHAM R. NARAYAN, DHANPAT RAI PUBLICATIONS.
MECHANICS OF STRUCTURES VOL. I AND VOL .2 by DR. H. J. SHAH AND S. B. JUNNARKAR, CHOTAR PUBLISHING HOUSE PVT. LTD.
BASIC STRUCTURE ANALYSIS by C.S REDDY, MCGRAW HILL EDUCATION.

COURSE/LEARNING OUTCOMES

After successfully studying this course, students will be able to:

CO1: Implement and demonstrate instructions regarding various parameters of water and sewage quality testing and air quality assessment.(Applying)

CO2: Demonstrate experimental procedures for water quality analysis (Applying)

CO3: Produce report on various parameters of water and sewage quality tests and air quality analysis.(Applying)

CO4: Present and justify results of water and sewage quality tests air quality monitoring.(Analysing)

List of Experiments

1. Physical Characterization of water: Turbidity, Electrical Conductivity, pH
2. Analysis of solids content of water: Dissolved, Settleable, suspended, total, volatile, inorganic etc.
3. Alkalinity and acidity, Hardness: total hardness, calcium and magnesium hardness
4. Analysis of ions: copper, chloride and sulfate
5. Optimum coagulant dose
6. Chemical Oxygen Demand (COD)
7. Dissolved Oxygen (D.O) and Biochemical Oxygen Demand (BOD)
8. Break point Chlorination
9. Bacteriological quality measurement: MPN,

CVSD359P: Structural Design II Lab**B Tech CVE -VI****1 Credit****Course Outcomes:**

After completion of the course , students will be able to ,

Identify and compute the design loads on various structural and steel systems

Apply principles relevant codal provisions for the analysis and design of various structural steel systems

Use commercial software for analysis and design of steel structures

Prepare detailed structural drawings for any given design.

List of Practicals :

Design and drawing of roof truss system

Design of column and column bases

Design of structural steel flooring system

Design of bolted and welded connections

Mapping of Course outcomes to practicals

CVIA208T : Internship Activity (Department Specific)**B Tech CVE-III semester****1 Credit (L-T-P:0-0-2)****Objectives:**

The one-week Department-Specific Internship aims to provide students with focused, hands-on exposure to departmental facilities, laboratory techniques, software tools, and micro-projects relevant to civil engineering. It intends to bridge classroom learning with practical experience by engaging students in structured lab activities, demonstrations, field observations, and mini-assignments conducted within the department. The internship enhances students' understanding of engineering practices, develops basic technical and professional skills, and prepares them for advanced laboratory courses and external internships.

Course Outcomes (COs)

After completing the Department-Specific Internship, students will be able to:

CO1: Describe the purpose, functioning, and applications of various civil engineering laboratories, equipment, and software used in the department.

CO2: Demonstrate basic hands-on skills through supervised experiments, field tasks, or software-based activities.

CO3: Interpret observations, experimental results, or analytical outputs to connect departmental activities with fundamental civil engineering concepts.

CO4: Prepare a concise internship record documenting tasks performed, skills learned, and reflections on departmental practices.

CO5: Exhibit teamwork, discipline, professional conduct, and adherence to safety protocols during departmental activities.

CVIN392P: Internship (after IV Semester)

B Tech CVE-V

4 Credits (L-T P: 0-0-8)

Objectives:

After IV Semester – Civil Engineering Students are required to undergo a four week Summer Internship during the semester break after the fourth semester. This internship is a credited course and will be recorded in the fifth semester.

The Summer Internship provides civil engineering students with valuable exposure to professional engineering practice by enabling them to apply classroom theories and principles to real-world construction sites, consulting firms, government departments, material testing laboratories, infrastructure projects, and environmental/transportation/geotechnical organizations.

During the internship, students gain insight into how civil engineering projects are planned, designed, executed, and managed. They will observe and participate in activities such as surveying, site supervision, quantity estimation, testing of materials, quality control procedures, safety practices, documentation, and project monitoring.

The internship helps students to:

- Explore different career pathways in the civil engineering domain

- Develop industry-relevant technical and professional skills

- Understand practical challenges and site constraints

- Observe real-life application of engineering standards, codes, and practices

- Enhance interpersonal skills, teamwork, and workplace professionalism

This internship bridges academic learning with field experience and strengthens students' readiness for advanced courses and future employment opportunities.

Course Outcomes (COs)

After completion of the Summer Internship, students will be able to:

CO1: Describe the organizational structure, workflow, and functioning of civil engineering firms, construction sites, or government agencies.

CO2: Demonstrate understanding of field practices, materials, equipment, and quality control procedures used in civil engineering projects.

CO3: Apply basic civil engineering concepts to real-life situations observed during the internship, such as surveying, testing, construction methods, and documentation.

CO4: Prepare a structured internship report summarizing observations, tasks performed, learning outcomes, and best practices.

CO5: Exhibit professional behavior, teamwork, communication skills, and adherence to worksite safety norms.

CVSC361P: Survey Camp

B Tech CVE VI

1 Credit (L-T-P: 0-0-2)

Survey Camp Internship – Objectives

To provide hands-on exposure to modern and conventional surveying instruments and field data collection techniques.

To develop the ability to plan and execute surveying tasks such as traversing, leveling, contouring, topographic mapping, route surveying, and construction layout.

To enable students to collect, analyze, and interpret field data accurately for real-world civil engineering applications.

To strengthen teamwork, field management skills, and professional ethics required during onsite civil engineering activities.

To integrate classroom learning with practical field experience, enhancing confidence and preparedness for professional surveying practice.

Course Outcomes (COs)

Upon successful completion of the Survey Camp Internship, students will be able to:

CO1: Use conventional and modern surveying instruments (Total Station, Auto Level, GPS/GNSS, Digital Theodolite) for accurate field measurements.

CO2: Plan and execute field surveys such as levelling, traversing, contouring, topographic surveys, and route alignment surveys.

CO3: Process, analyze, adjust, and interpret the collected field data to prepare maps, profiles, and plans using manual methods and relevant software (e.g., CAD/GIS).

CO4: Apply survey results to real-world civil engineering scenarios such as site planning, design layout, and construction management.

CO5: Work effectively in teams, follow field safety protocols, and prepare professional field books, drawings, and technical reports.

CVIN473P: INDUSTRIAL TRAINING

B Tech CVE-VII

(6 credits) L-T-P :0-0-12

Objectives :

During the semester break at the end of the third year, the students are required to undergo an industrial training. The purpose of the industrial training is to expose students to real-life industry situations, so that they may be able to apply the engineering knowledge and skills that they have gained through classroom teaching and lab activities, in an on-the-job situation. After the period of training, students are required to present their experience in the form of reports and seminar presentations. Students will be evaluated on the seminar, viva-voce examination and written reports.

COURSE / LEARNING OUTCOMES:

On completion of the course the students will be able to:

CO1: Relate the lessons learned in a classroom into real world experience set in a professional practice-oriented environment.

CO2: Summarize the activities required for a complete project and develop professional skills such as team work, effective communication and social interaction.

CO3: Make use of the latest software to analyze problems related to Civil Engineering and adapt to software and equipment as per the industrial requirements.

CO4: Identify, formulate and model problems and find engineering solution based on a system.

CVMP474P: Minor Project –

(1 credit) (L-T-P: 0-0-2)

Course Description / Details

Objectives

The Minor Project aims to develop students' ability to apply theoretical knowledge to practical, real-world civil engineering problems. Students will work in small groups (maximum 5 members) to plan, execute, and document a technically sound project in any selected domain of Civil Engineering. The project encourages creative thinking, problem solving, analytical skills, and professional presentation abilities.

Students may choose any domain of Civil Engineering, including but not limited to:

Structural Engineering

Geotechnical Engineering

Transportation Engineering

Environmental Engineering

Water Resources Engineering

Construction Materials and Management

Surveying and GIS Applications

Sustainability and Green Technologies

Smart Materials / Smart Infrastructure

Waste Utilization in Construction

Automation, AI/ML applications in Civil Engineering

Project Guidelines

Project Selection & Proposal (Phase I):

Students must identify a relevant civil engineering problem, justify its importance, and prepare a project proposal including objectives, scope, methodology, and expected outcomes.

Planning & Initial Study:

Preparation of preliminary drawings, literature review, data collection plan, and methodology design (e.g., sampling plan, modelling approach, mix design, survey plan, software selection, experiment setup etc. based on project type).

Execution (Phase II):

Students will carry out detailed analysis, design, modelling, simulation, experiments, or field work depending on the project domain.

For structural/transportation/water analysis: analytical and/or software-based modelling.

For environmental/materials projects: laboratory studies, testing, and performance evaluation.

For geotechnical/survey/GIS projects: field data, mapping, modelling or testing.

Progress Seminars:

Two progress reviews will be conducted:

After completion of the planning and methodology stage

After completion of the analysis/experimental results stage

These will be evaluated by a panel of internal examiners.

Final Report & Viva Voce:

Students must submit a detailed technical report including background, methodology, results, discussion, and conclusions. A final presentation and viva voce will complete the evaluation.

Course Outcomes (COs)

At the end of the Minor Project, students will be able to:

CO1: Identify, formulate, and define a civil engineering problem in a chosen domain with clear objectives, scope, and relevance.

CO2: Develop and apply appropriate methodologies—including analytical, experimental, computational, or design-based techniques—to investigate the selected problem.

CO3: Analyze, interpret, and validate the results using scientific reasoning, engineering principles, and industry-standard tools/software.

CO4: Prepare a structured project report and effectively communicate technical findings through presentations, demonstrations, and viva voce.

CVPR486P:PROJECT(4 credits) (L-T-P: 0-0-8)

Objectives: Each student group consisting of not more than 5 members is expected to plan, analyze and design a multi storied building and verify the work with a design and analysis software package. Students will identify and plan a multi storied building, prepare the drawings and perform gravity analysis followed by seismic analysis.

There will be three progress seminars - after the planning after the gravity and seismic analysis, after designing and detailing which will be evaluated by a panel of internal examiners. This will be followed by verification

of the analysis and design using a software package. The project work will be concluded with quantity estimation and preparation of report. The internal assessment shall be evaluated by the DPEC and the external assessment shall be done by the external examiner(s) assisted by the DPEC and the supervisor. The modality and components of the internal assessment and their weightages shall be notified at the beginning of each semester.

COURSE/LEARNING OUTCOMES:

On completion of the course the students will be able to:

CO1: List different types of buildings and components, their analyses and design methods and demonstrate a sound technical knowledge on planning a civil Engineering project.

CO2: Identify the support conditions and types of members in a building frame.

CO3: Analyse the structural members to arrive at the design values.

CO4: Design the structural members of a project optimizing the cost and materials and Use design software for analyzing different types of structures.

CO5: Compile all the analysis results for the design of different members.

SERVICE LEARNING (2 credit)

Objective Service Learning is an experience-based approach to education. It is a course-based service experience that produces the best outcomes when meaningful service activities are related to the course material through reflection and critical inquiry. It deepens and enriches the theoretical and conceptual side of learning. Service-Learning combines – Academic Instruction, Meaningful Service and Critical and Reflective thinking.

Module I

Introduction to service learning-Its philosophy, historical background, purpose, value & theoretical framework; Locating Service Learning within the University context, Basic elements of service learning, Historical context of University Community Partnership; Understanding Community & Community Partnership; Ethical understanding of partnership; Understanding the agency of the Community – as co-educators; Community barriers; Understanding of society & social issues; Culture and Power Dynamics; Power & Privilege; social responsibility and engagement with the community.

Module II a.

Disaster management: Basic concepts and definition – hazard , disaster , impacts of disaster , types of hazards , types of disaster ; vulnerability , types of vulnerability , risk , capacity ;

b. Pre-disaster phase activities – awareness campaign in the community , prevention , mitigation measures; Preparedness, participatory learning action with the community , identifying community shelters , protecting livestock , making use of available resources within the community , mock drills, skill training , self-made life jackets , community stock of granary , survival kits , first- aid drill , identify early signs , identify critical facilities and their location like school , shelters , police etc .

c. During and post-disaster disaster activities - Early warning dissemination, response action , evacuation of temporary shelters , use of relief camps , arrangement of safe drinking water and sanitation , assist in rescue and relief efforts , carcass disposal , search , rescue , relief , recovery – safe reconstruction , rehabilitation , identifying safe routes .

d. Field work : Students are required to help the community in designing safe playgrounds , in training them with mock drills and in identifying similar relief and community shelter during and post disaster phase .

Module III

Syllabus for CVE (Field Work): Identification, use and application of different materials used for construction of concrete structures; preparation of concrete, Brick masonry procedure; Types of bond – English and Flemish; temporary structures like formwork, scaffolding, shuttering etc ; Ties , stirrups , reinforcements used in building construction; Casting of slabs , columns , beams ; Types and methods of curing .

Suggested Readings:

1. R. Subramanian , “ Disaster Management “ , Vikas Publishing house .
2. B.C. Punmia , “ Building Construction “ , Laxmi Publications .
3. M.S. Shetty , “ Concrete Technology Theory and Practice “ , S Chand Publishing .
4. R.K. Rajput , “ Engineering materials “ , S Chand & Company.
5. Varghese P.C , “Limit State Design of Reinforced Concrete” , Prentice Hall India Learning P

Students will have to complete following two courses in between First semester to Fourth semester
 Constitution of India through Moodle platform
 One NPTEL course in SWAYAM platform

CSPS0079: PROGRAMMING FOR PROBLEM SOLVING

(3 credits-45 Hours)

Course Objectives

Course Outcomes

Define and describe various terms and concepts of C programming language (Remembering)

Compare and interpret information based on their understanding of the concepts of C language syntax, data types, control statements, functions, pointers, arrays, structures, files, graphics and hardware programming using C. (Understanding)

Solve problems using standard algorithms and translate pseudo-codes into C programs and implement them. (Applying)

Analyze their skills for choosing the right data structure, function, data types and develop logic to solve various instances of problems. (Analyze)

Combine the various concepts and ideas learnt in C to plan, propose and develop a product. (Creating)

Evaluate various algorithms used for searching, sorting etc., in terms of correctness and computation cost. (Evaluate)

Module I (8 Hours)

Introduction to Programming, Introduction to components of a computer system (disks, memory, processor, where a program is stored and executed, operating system, compilers etc.), and Idea of Algorithm: steps to solve logical and numerical problems. Types of Algorithm: Sequentially executed, Conditional Based, repetitive structure, Representation of Algorithm: Flowchart/Pseudo code with examples, from algorithms to programs; source code, variables (with data types) variables and memory, locations, Syntax and Logical Errors in compilation, object and executable code.

Module II (12 Hours)

Operators, precedence of operators, Arithmetic expressions, Conditional Branching and Loops, Writing and evaluation of conditionals and consequent branching, Iteration and loops.

Module III (5 Hours)

Arrays, Arrays (1-D, 2-D), Character arrays and Strings

Module IV (5 Hours)

Basic Algorithm Searching, Basic Sorting Algorithms (Bubble, Insertion and Selection), Finding roots of equations, notion of order of complexity through example programs (no formal definition required)

Module V (8 Hours)

Functions (including built in libraries), Parameter passing in functions, call by value, passing arrays to functions: idea of call by reference, Recursion.

Module VI (7 Hours)

Structures, Defining structures and Array of Structures, Idea of pointers, Defining pointers, Use of Pointers in self-referential structures, notion of linked list (no implementation), File handling.

Suggested Readings

Byron Gottfried, Schaum's Outline of Programming with C, McGraw-Hill

E. Balaguruswamy, Programming in ANSI C, Tata McGraw-Hill

CSPL6069: PROGRAMMING FOR PROBLEM SOLVING LAB

(2 credits)

Course Outcomes

Relate the programming logic (Remembering)

Illustrate the theoretical concepts learnt in C programming language. (Understanding)

Apply existing algorithms in writing programs using C language and also do graphics programming. (Applying)

Analyze their skills for choosing the right data structure, functions, data types and develop logic to write programs in C. (Analyzing)

Evaluate the sorting and searching algorithms through implementation in terms of correctness and computation cost. (Evaluating)

Combine the various concepts and ideas learnt in C to plan, propose and develop a product. (Creating)

MATHEMATICS- I

(3 credits-45 Hours)

Course Objectives: The goal of this course is to achieve conceptual understanding and to retain the best traditions of traditional calculus. The syllabus is designed to provide the basic tools of calculus mainly for the purpose of modelling the engineering problems mathematically and obtaining solutions. This is a foundation course which mainly deals with topics such as single variable and multivariable calculus and plays an important role in the understanding of science, engineering, economics and computer science, among other disciplines.

Course Contents**Module 1: Single-variable Calculus (Differentiation): (10 hours)**

Rolle's Theorem, Mean value theorems and applications; Extreme values of functions; Linear approximation; Indeterminate forms and L'Hospital's rule. Curvature, evolutes and involutes; Evaluation of definite and improper integrals; Beta and Gamma functions and their properties; Applications of definite integrals to evaluate surface areas and volumes of revolutions.

Module 2: Sequences and series: (10 hours)

Limits of sequence of numbers, Calculation of limits, Infinite series; Tests for convergence; Power series, Taylor and Maclaurin series; Taylor theorem, convergence of Taylor series, error estimates.

Module 3: Multivariable Calculus (Differentiation): (10 hours)

Limit, continuity and partial derivatives, directional derivatives, gradient, total derivative; Tangent plane and normal line; Maxima, minima and saddle points; Method of Lagrange multipliers.

Module 4: Multivariable Calculus (Integration): (10 hours)

Multiple Integration: Double integrals (Cartesian), change of order of integration in double integrals, Change of variables (Cartesian to polar), Applications: areas and volumes, Center of mass and Gravity (constant and variable densities); Triple integrals (Cartesian), orthogonal curvilinear coordinates, Simple applications involving cubes, sphere and rectangular parallelepipeds; Scalar line integrals, vector line integrals, scalar surface integrals, vector surface integrals, Gradient, curl and divergence, Theorems of Green, Gauss and Stokes.

Alternative NPTEL/SWAYAM Course:

S. No	NPTEL COURSE NAME	INSTRUCTOR	HOST INSTITUTE
1	Engineering Mathematics - I	PROF. JITENDRA KUMAR	IIT Kharagpur

COURSE OUTCOMES

The objective of this course is to familiarize the prospective engineers with techniques in calculus, multivariate differentiation and integration. It aims to equip the students with standard concepts and tools at an intermediate to advanced level that will serve them well toward tackling more advanced level of mathematics and applications that they would find useful in their disciplines.

At the end of this course students will be able to:

- CO 1: To apply differential and integral calculus to notions of curvature and to improper integrals. Apart from some other applications they will have a basic understanding of Beta and Gamma functions. (Applying)
- CO 2: The fallouts of Mean value theorems that is fundamental to application of analysis to Engineering problems. (Analysis)
- CO 3: Find the concepts of convergence of sequence and series for real numbers. (Remembering)

CO 4: Classify various functions of several variables that are essential in most branches of engineering. (Understanding)

EEBE0038: BASIC ELECTRICAL ENGINEERING

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objectives:

- To understand and Analyse basic electric and magnetic circuits.
- To study the working principles of electrical machines and power converters.
- To introduce the components of low voltage electrical installations.

Course Outcomes

- Define basic terminologies related to electrical circuits and machines. (Remembering)
- Explain the working principle, construction, applications of dc machines and ac machines. (Understanding)
- Explain basics of converters, domestic wiring and Electrical Installations. (Understanding)
- Implement network theorems to simplify and solve a complex circuit. (Applying)
- Interrogate basic DC as well as AC circuits. (Analyzing)

Module I (18 lectures)

Electrical circuit elements (R, L and C), voltage and current sources, Kirchoff current and voltage laws, analysis of simple circuits with dc excitation. Superposition, Thevenin and Norton Theorems. Time-domain analysis of first-order RL and RC circuits.

Module II (16 lectures)

Representation of sinusoidal waveforms, peak and rms values, phasor representation, real power, reactive power, apparent power, power factor. Analysis of single-phase ac circuits consisting of R, L, C, R-L, R-C, R-L-C combinations (series and parallel), resonance. Three phase balanced circuits, voltage and current relations in star and delta connections.

Module III (14 lectures)

DC Machines: Principle of operation of generators and motors, construction of DC machine, EMF and Torque Equations, Classification and applications of DC machines. Transformer: Construction and principle of operation of a single-phase transformer, EMF equation, introduction of auto-transformer. Induction Motor: Classification and applications, Construction and principle of operation of single phase and three-phase induction motor

Module IV (6 lectures)

DC-DC buck and boost converters, duty ratio control. Single-phase and three-phase voltage source inverters; sinusoidal modulation.

Module V (6 lectures)

Components of LT Switchgear: Switch Fuse Unit (SFU), MCB, ELCB, MCCB, Types of Wires and Cables, Earthing. Types of Batteries, Important Characteristics for Batteries. Elementary calculations for energy consumption, power factor improvement and battery backup.

PSPT0038: PHYSICS FOR TECHNOLOGISTS
(4 Credits – 60 Hours) (L-T-P: 3-1-0)

Course Objective: To enhance the fundamental knowledge in Physics and its applications pertinent to diverse areas of Engineering and Technology

COURSE OUTCOMES

At the end of this course students will be able to:

- CO1: Comprehend the principles of wave optics. (Understanding)
 CO2: Explain the electromagnetic theory and electromagnetic waves. (Remembering)
 CO3: Interpret the concepts and principles in quantum mechanics. (Understanding)
 CO4: Analyse the physics of semiconductors and their applications. (Analysing)

Module I: Wave Optics (18Hours)

a) Interference and diffraction: Huygen's principle, superposition of two waves, coherent sources, Young's double slit experiment, intensity distribution; Newton's rings and applications. Fresnel and Fraunhofer diffraction, Transverse wave on a string, the wave equation on a string, Harmonic waves, reflection and transmission of waves at a boundary, Harmonic oscillator; Damped harmonic motion – over-damped, critically damped and under-damped oscillators

b) Photonics: spontaneous and stimulated emission, fundamentals of laser action, ruby Laser, He-Ne laser, applications of lasers. Elements of fibre optics, types of optical fibres, numerical aperture. Principles of holography.

Module II: Electromagnetic Theory (14Hours)

a) Electromagnetism: basic idea of divergence and stokes theorems, Gauss's law and its applications, electrostatic potential, Poisson's and Laplace's equation, work and energy, dielectric polarization bound charges, electric displacement (D); magnetic induction (B), magnetic intensity (H), Biot-Savart's Law, Ampere's circuital law; magnetic susceptibility and ferromagnetic, paramagnetic and diamagnetic materials; Faraday's law of electromagnetic induction, displacement current, Maxwell's equations in differential and integral forms.

b) Electromagnetic waves: Electromagnetic energy densities, Electromagnetic wave equations for E and B, transverse nature and speed of electromagnetic waves.

Module III: Quantum Physics and Applications (14 Hours)

a) Quantum physics: historical overview; particle aspect of radiation – blackbody radiation, photoelectric effect, Compton scattering; wave aspect of particles – de Broglie's hypothesis, matter waves; Heisenberg's uncertainty principle; transition from deterministic to probabilistic states of a system – wave functions, probability density, superposition principle; observables and operators, expectation values. Schrodinger wave equation.

b) Application of quantum mechanics: solutions of one-dimensional problem, infinite deep potential well – energy eigenvalues, eigenfunctions, potential barrier – tunneling.

Module IV: Semiconductor Physics (14Hours)

a) Free electron theory, density of states and energy band diagrams, Kronig-Penny model (to introduce origin of band gap), energy bands in solids, E-k diagram, direct and indirect bandgaps, types of electronic materials: metals, semiconductors, and insulators, density of states, occupation probability, Fermi level, effective mass, phonons.

b) Intrinsic and extrinsic semiconductors, dependence of Fermi level on carrier- concentration and temperature (equilibrium carrier statistics), carrier generation and recombination, carrier transport: diffusion and drift, p-n junction, Special purpose diodes: metal- semiconductor junction, Zener Diode, LED, Photovoltaic Effect, Solar cell

Suggested Readings

Physics for Engineers and Technologists, S. Dey, Eastern Book House.

Applied Physics for Engineers –Neeraj Mehta (PHI Learning Pvt. Limited)

A text Book of Engineering Physics –Dr. M.N. Avadhanulu and Dr.P.G.Kshirsagar (S. Chand and Company Pvt. Limited).

Optics, A. Ghatak, Tata Mcgraw Hill.

Introduction to Electrodynamics, D. J. Griffiths, Pearson, Prentice Hall.

Concepts of Modern Physics, A. Beiser, McGraw Hill.

Quantum Mechanics, L. I. Schiff, McGraw Hills.

Quantum Mechanics, E. Merzbacher, Wiley.

Quantum Mechanics, G. Aruldas, PHI learning.

Classical Mechanics, H. Goldstein, Addison-Wesley.

Semiconductor Optoelectronics: Physics and Technology, J. Singh, McGraw Hill.

Semiconductor Devices: Physics and Technology, S. M. Sze, Wiley.

Semiconductor Optoelectronic Devices, P. Bhattacharya, Prentice Hall of India.

PSTC6016: PHYSICS LAB FOR TECHNOLOGISTS

(1 credits) (L-T-P:0-0-2)

At the end of this course students will be able to:

CO1: explain the usage of mechanical and optical systems for various measurements (Understanding)

CO2: apply the analytical techniques and graphical analysis to the experimental data (Applying)

CO3: evaluate vernier calipers, various rulers, meters, scales and other measuring devices to acquire measurements within the stated precision (Evaluating)

At least 10 experiments should be performed from the following

1. To determine the frequency of an Electrical maintained tuning fork by Melde's experiments
2. Determination of surface tension by capillary rise method.
3. Determination of wavelength of light by Newton's ring method.
4. Determination of grating element of a diffraction grating.
5. Determination of wavelength of laser source by diffraction grating method.
6. Study of photoemission.
7. Determination of Rigidity modulus by static method.

8. Determination of acceleration due to gravity by Bar pendulum.
9. Determination of thermal conductivity by Lee's method
10. Plotting of characteristic curve of a PN junction diode.

EEBL6027: BASIC ELECTRICAL ENGINEERING LABORATORY

(1 Credit- 30 hours) (L-T-P: 0-0-2)

Course Outcomes

Find different parameters related to basic electrical circuits. (Remembering)

Explain the procedure for performing experiments related to DC and AC circuits. (Understanding)

Identify various rotating AC and DC machines. (Applying)

Compare the theoretical prediction with experimental results. (Analyzing)

Check errors and correction of meters by calibration (Evaluating)

Construct a circuit to perform a particular experiment. (Creating)

List of experiments:

Calibration of a Voltmeter.

Calibration of an Ammeter.

Calibration of milliammeter as a voltmeter.

Calibration of a millivoltmeter as an ammeter.

Verification of Thevenin's theorem.

Resonance in series RLC circuit

Reversal of direction of rotation of 3-phase induction motor by changing phase sequence.

Different types of Connections of the transformer.

Demonstration of DC and AC machines.

Demonstration of LT switchgear.

MNWM6023: WORKSHOP/MANUFACTURING PRACTICES

(3 Credits) (L-T-P: 1-0-2)

Objective

Upon completion of this course, the students will gain knowledge of the different manufacturing processes which are commonly employed in the industry, to fabricate components using different materials.

Course/Learning Outcomes

At the end of the experiments students will be able to

Recognize different fabrication techniques. (Remembering)

Identify the tools and machinery involved in the various experiments related to material processing. (Understanding)

Demonstrate some of the advanced and latest manufacturing techniques being employed in the industry. (Applying)

Recognize the different manufacturing processes which are commonly employed in the industry. (Understanding)

Fabricate simple components using different materials and fabrication techniques. (Applying)

Manufacturing Practice

Manufacturing Methods- casting, forming, machining, joining, advanced manufacturing methods (3 hours)

CNC machining, Additive manufacturing (1 hour)

Fitting operations and power tools (1 hour)

Electrical and Electronics (1 hour)

Carpentry (1 hour)

Plastic moulding, glass cutting (1 hour)

Metal casting (1 hour)

Welding (arc welding and gas welding), brazing (1 hour)

Workshop Practice

Machine shop (10 hours)

Fitting shop (8 hours)

Carpentry (6 hours)

Electrical and Electronics (8 hours)

Welding shop (8 hours) (Arc welding 4 hrs + gas welding 4 hrs)

Casting (8 hours)

Smithy (6 hours)

Plastic moulding and Glass Cutting (6 hours)

MATHEMATICS- II

(4 Credits – 60 Hours)

Course Objective:

Mathematics fundamental necessary to formulate, solve and analyze engineering problems.

Course Content:

Module 1: Matrices (12 hours)

Determinant, Inverse of a matrix, Linear Systems of Equations; System of linear equations; Symmetric, skew-symmetric and orthogonal matrices; Rank of a Matrix; Echelon form, Normal form, Gauss-Jordan method, Gauss elimination method, Linear Dependence and Independence; Eigenvalues and eigenvectors; Orthogonal transformation; Diagonalization of matrices; Cayley-Hamilton Theorem, rank-nullity theorem.

Module 2: First and higher order ordinary differential equations: (12 hours)

Exact, linear and Bernoulli's equations. Equations not of first degree: equations solvable for p, equations solvable for y, equations solvable for x and Clairaut's type. Second order linear differential equations with variable coefficients: Euler-Cauchy equations, solution by variation of parameters; Power series solutions: Legendre's equations and Legendre polynomials, Bessel's equation and Bessel's functions of the first kind and their properties.

Module 3: Complex Variable – Differentiation: (8 hours):

Differentiation, Cauchy-Riemann equations, analytic functions, harmonic functions, finding harmonic conjugate; elementary analytic functions (exponential, trigonometric, logarithm) and their properties; Conformal mappings, Mobius transformations and their properties.

Module 4: Complex Variable – Integration: (8 hours):

Contour integrals, Cauchy-Goursat theorem (without proof), Cauchy Integral formula (without proof), Liouville's theorem and Maximum-Modulus theorem (without proof); Taylor's series, zeros of analytic functions, singularities, Laurent's series; Residues, Cauchy Residue theorem (without proof),

Note: The modules have been prepared keeping the following from the Textbooks/References in mind:

- (1) Module 1: Sections 7.3-7.5, 7.7, 7.8, 8.1-8.4 of [1].
- (2) Module 2: Sections 1.4, 1.5 of [1]; Section 5.1 of [2].
- (3) Module 3: Sections 2.5, 2.6, 2.10, 5.1, 5.3, 5.4, 5.5 of [1].
- (4) Module 4: Sections 13.3 – 13.7, 17.1 – 17.3 of [1].
- (5) Module 5: Sections 14.1 – 14.4, 15.2 – 15.4, 16.1 – 16.4 of [1].

Alternative NPTEL/SWAYAM Course:

S. No	NPTEL COURSE NAME	INSTRUCTOR	HOST INSTITUTE
1	Engineering Mathematics - II	PROF. JITENDRA KUMAR	IIT Kharagpur

COURSE OUTCOMES

The objective of this course is to familiarize the prospective engineers with techniques in matrices, ordinary differential equations and complex variables. It aims to equip the students to deal with advanced level of mathematics and applications that would be essential for their disciplines.

At the end of this course students will be able to:

CO 1: Determine the essential tool of matrices and linear algebra in a comprehensive manner. (Understanding)

CO 2: Recall the effective mathematical tools for the solutions of differential equations that model physical processes. (Remembering)

CO 3: Use the tools of differentiation and integration of functions of a complex variable that are used in various techniques dealing engineering problems. (Applying)

CO 4: Analysis complex techniques applied to diverse problem-solving situations in engineering and other mathematical contexts. (Analysing)

CHCE0027: Engineering Chemistry Theory

Credit: 4 (L: 3, T: 1, P: 0)

Course Objective: The course of Engineering Chemistry enables the students to gain knowledge on atomic and molecular structures, basics of thermodynamics, periodic properties of elements, application of some important spectroscopic techniques and structure of organic molecules as well as some important organic reactions used in the synthesis of organic compounds used for medicinal purposes.

Course Outcomes:

CO1: Recall fundamental concepts of 10+2 level of physical, organic and inorganic chemistry. (*Remembering*).

CO2: Ability to gain knowledge on molecular structure and spectroscopy, intermolecular forces and periodic properties (*Understanding*).

CO3: Analyze the structures of atoms and molecules using spectroscopic techniques. (*Analysis*)

CO4: Apply the knowledge of spectroscopy for determining molecular geometries, interpret the thermodynamics of system and structure of organic compounds and their reaction paths/mechanism. (*Applying*)

CO5: Assess the knowledge of atomic and molecular structure to evaluate the energy level diagram in the atomic and molecular level (*Evaluating*)

Course Contents:

Module 1: Atomic and Molecular Structure (10 lectures)

Schrodinger's Equation, Particle in a box solutions, Forms of Hydrogen atom wave functions and the plots of these functions to explore their spatial variations, equations for atomic and molecular orbitals, energy level diagrams of diatomic, π molecular orbitals of butadiene and benzene and aromaticity, Crystal Field Theory and the energy level diagrams for transition metal ions and their magnetic properties, structure of solids, band theory of solids and their role of doping on band structures.

Module 2: Spectroscopic Techniques and applications (12 lectures)

Principles of spectroscopy and selection rules, Electronic Spectroscopy, Fluorescence and its applications in medicine, Vibrational and Rotational spectroscopy of diatomic molecules, nuclear magnetic resonance and magnetic resonance imaging, surface characterization techniques, diffraction and scattering.

Module 3: Use of free energy in chemical equilibria (10 lectures)

Thermodynamic functions: energy, entropy and free energy, free energy and emf, cell potentials, the Nernst equation and applications, Acid base, oxidation reduction and solubility equilibria, Corrosion, Use of free energy considerations in metallurgy through Ellingham diagrams.

Module 4: Intermolecular forces and periodic properties (10 lectures)

Ionic, di-polar and van der Waal's interactions.

Effective nuclear charge, penetration of orbitals, variations of s, p, d orbital energies of atoms in the periodic table, electronic configurations, atomic and ionic sizes, ionization energies, electron affinity and electronegativity, polarizability, oxidation states, coordination numbers and geometries, hard soft acids and bases.

Module 5: Stereochemistry (12 lectures)

Representation of three dimensional structures, structural isomers and stereoisomers, configurations and symmetry and Chirality, enantiomers, diastereomers, optical activity, absolute configurations and conformational analysis, isomerism in transition metal compounds.

Module 6: Organic Reactions and Synthesis of Drug molecule (6 lectures)

Introduction to reactions involving substitution, addition, elimination, oxidation and reduction, synthesis of a commonly used drug molecule – Aspirin and Paracetamol.

CHCE6006: ENGINEERING CHEMISTRY LAB

Credit: 2 (P-2)

Objective: This course consists of experiments illustrating the principles of chemistry relevant to the study of science and engineering.

Course Outcomes:

CO1: Explain the principles of the experiments learned about in class, illustrating the principles of chemistry relevant to the study of science and engineering (*Understanding*)

CO3: Estimate molecular/system properties such as surface tension, viscosity, conductance of solution, water hardness, etc. (*Applying*)

CO4: Assess the limitations and advantages of the procedures they use in the laboratory for the various estimations and analysis. (*Evaluating*)

List of experiments:

Standardization of given HCl with standard sodium carbonate solution.

Determination of water hardness with EDTA.

Estimation of Calcium in Limestone.

Determination of dissolved oxygen in water sample by Winkler's method.

Determination of surface tension of a given liquid by stalagmometer.

To determine the coefficient of viscosity of a given liquid or solution with the help of Ostwald's Viscometer.

To measure the Adsorption of acetic acid by charcoal.

Determination of chloride content of water.

To determine the strength of magnesium ions in magnesium sulphate solution by complexometric method.

Determination of partition coefficient of a substance between two immiscible liquids.

Determination of free carbon dioxide in given water sample.

To determine the alkalinity of given water sample.
Determination of Ferrous Ions in Mohr's salt by KMnO_4
To determine the acidity of a given water sample.
Determine the cell constant and conductance of solution.
Determination of sodium hydroxide and sodium carbonate in a mixture.
Determination of the composition of the given mixture by viscosity method.

Suggested Readings:

Engineering Chemistry, Shashi Chawla, Dhanpat Rai and Co, Education and technical publishers.
Vogel's Practical Chemistry.

ECEC0050: ANALOG ELECTRONIC CIRCUITS (L-T-P: 3-0-0)

(3 Credit-45 hours)

Objective:

The course provides basic analog electronic circuit design techniques and analytical skills using diodes, op-amps, FETs and BJTs. The student will develop the ability to apply basic engineering sciences to the design, analysis and operation of electronics devices and circuits and problem solving skills of electronic circuits.

Course Outcomes

Define various terminologies related to different analog electronic devices and circuits. (Remembering)
Illustrate the basic working principle and operation of various electronic components and circuits. (Understanding)

Solve problems related to the modeling and design of various analog circuits. (Applying)

Analyse the characteristics/working principle/operation of various analog circuits. (Analysing)

Design and develop different analog electronic circuits. (Creating)

Module I (7 hours)

P-N junction diode, I-V characteristics of a diode; review of half-wave and full-wave rectifiers, Zener diodes, LED, photodiode, clamping and clipping circuits

Module II (10 Hours)

PNP and NPN transistors, Structure and I-V characteristics of a BJT, BJT as a switch, BJT as an amplifier: small-signal model, biasing circuits, current mirror; common-emitter, common-base and common collector amplifiers, phototransistor, Small signal equivalent circuits (h-parameter model) and analysis CE configuration.

Module III (10 Hours)

JFET and MOSFET structure and I-V characteristics, JFET and MOSFET as a switch, as an amplifier: small-signal model and biasing circuits, common-source, common-gate and common-drain amplifiers; small signal equivalent circuits - gain, input and output impedances, transconductance, CMOS inverter

Module IV (4 Hours)

Internal structure of an operational amplifier, ideal op-amp, non-idealities in an op-amp (Output offset voltage, input bias current, input offset current, slew rate, gain bandwidth product, output voltage swing)

Module V (7 Hours)

Op-amp as Inverting and non-inverting amplifier. Op-Amp applications in constant gain multiplier, Voltage summing, Integrator, Differentiator and controlled sources. Differential amplifier, instrumentation amplifier, active filters, voltage regulator, Zero Crossing Detector, Square-wave and triangular-wave generators

Module VI (7 Hours)

555 Timer: Block diagram, Monostable operation, Astable operation Regulated Power Supply: Voltage feedback regulation, Current limiting characteristics, Power supply characteristics, Current boosters, Switching regulators

Suggested Readings

ECEEC6039: ANALOG ELECTRONIC CIRCUITS LAB

(L-T-P: 0-0-2) (1 credit)

Course Outcomes

Define PN junction diode and their properties and uses. (Remembering)

Explain the working of basic electronic circuits such as transistors, diodes and amplifiers. (Understanding)

Build different circuits using diodes, transistors and OPAMPs. (Applying)

Analyse various amplifier and filter circuits. (Analysing)

Evaluate the performance of the 555 timer as a monostable and astable vibrator. (Evaluating)

Design amplifiers, integrators, oscillators and filter circuits using OPAMPs. (Creating)

List of Experiments:

To Study the Characteristics of Zener Diodes.

Study of the Half-wave and Full-wave rectifier circuits with and without capacitor filter

To Study the characteristics of a Bipolar Junction Transistor (CE Mode)

To design of CE amplifier and analyse the frequency response of the amplifier

To Study the Characteristics of JFET

Inverting and non-inverting op-amp amplifiers

Op-amp linear applications: adders, sub-tractors

Op-amp based active filters: Low Pass and High Pass

Instrumentation Amplifier

555 timer applications: Monostable and Astable

CSXXXXXXX: DATA STRUCTURES AND ALGORITHMS

(3 credits – 45 hours)

COURSE/LEARNING OUTCOMES

Understanding abstract specification of data-structures and their implementation. (Understanding)

Ability to use suitable data-structures in different programs and applications. (Applying)

Ability to analyse different algorithms and the trade-offs involved in terms of time and space complexity. (Analysing)

Choose and implement efficient data structures and apply them to solve problems. (Evaluating)

Module 1 (5 hours)

Basics of data structures and algorithms. Understanding the growth rates of functions such as logarithmic and polynomial. Analysis of algorithms in terms of space and time, worst-case, average-case and best-case complexity analysis. Asymptotic Notation: Ω and Θ .

Module II (8 hours)

Abstract data-type (ADTs): arrays and linked list ADTs. Stacks, Queues: ADTs and implementations using arrays, linked lists. Doubly linked lists: ADT and implementation. Dictionary ADT: implementation using array, linked lists. Binary search and linear search and their advantages/disadvantages and their complexity analysis. Binary tree: concept, traversal (inorder, preorder and post-order), implementation using array and linked list.

Module III (5 hours)

Priority Queue ADT, Definition of heap. Implementation of Priority Queues using heap and running time analysis. Implementation of heap using arrays. Heap-sort and its analysis.

Module IV (8 hours)

Binary Search Trees: definition and some basic algorithms. Implementation of Dictionary ADTs using Binary Search trees and running time analysis. AVL trees: height balance condition, rotations, and implementation of dictionary ADT. 2-4 Trees: Multi-way search trees, implementation of dictionary ADT, B-trees: characteristics, insertion, and deletion.

Module V (7 hours)

Map ADT, Hash Tables and implementation of Map using Hash Tables. Design of hash functions, Collision resolution schemes: chaining, open addressing schemes like linear probing, quadratic probing, double hashing. Applications of Hashing: finding duplicates, set intersection, etc. Tries: implementation of Map ADT using tries. Compressed tries and suffix tries.

Module VI (6 hours)

Bubble sort, insertion sort, selection sort. Merge sort and divide and conquer paradigm, Quick sort: average and worst-case analysis, randomized quicksort (intuitive explanation). Selection based on partitioning ideas used in Quick Sort.

Module VII (6 hours)

Graph ADTs and applications, Adjacency list and adjacency matrix representations and relative merits. Basic graph definitions: paths, cycles, trees, spanning trees, connected components, Euler's formula. Depth First Search Traversal algorithm for directed graphs: classification of edges into forward, back, and cross edges. Applications to cycle finding, topological sort in directed acyclic graphs, finding connected components. Running-time analysis. Breadth first search algorithm: implementation using queues, shortest path tree property. Running time analysis.

CSDS6072: DATA STRUCTURE AND ALGORITHM LAB

(2 credits)

Course Outcomes

Explain the concept of different data types, primitive, derived and their representation and application through coding. (Understanding)

Apply the concept of ADT and linear and nonlinear data types and their representation. (Applying)

Apply these data types in various applications like arithmetic expression evaluation and conversion. (Applying)

Explain the concept of Graphs and Trees and their real time application. (Understanding)

Develop various searching and sorting techniques. (Creating)

Choose and implement efficient data structures and apply them to solve problems. (Evaluating)

Solution of problems on

dynamic memory allocation

structures and pointers to structures

Arrays

Stacks and Stack application, Queues

Linked Lists, Circular and Doubly Linked Lists.

Binary Trees

Searching and data modification: Linear Search, Binary Search, Hashing.

Sorting Techniques: Selection, Insertion, Bubble, Merge, Heap, Quick, Radix, and Merge-Sort.

CSDC0081: DIGITAL ELECTRONICS

(3 credits – 45 hours)

Course Outcomes

Explain number systems, coding methods, Boolean algebra, logic circuits, logic families, and memory types. (Understanding)

Convert numbers between different number and coding systems and perform the basic arithmetic operations (addition, subtraction, division, and multiplication). (Applying)

Minimize Boolean functions using postulates and theorems of Boolean algebra, Karnaugh maps and Quine McCluskey method. (Applying)

Analyze combinational and sequential logic circuits to obtain Boolean expressions, state tables and state diagrams implemented by the circuits. (Analysing)

Design combinational and sequential logic circuits for given problem statements. (Creating)

Build logic gates using TTL, ECL and CMOS technologies. (Creating)

Module I: Data representation and arithmetic operations (5 Hours)

Introduction, numbering systems, decimal to binary conversion, binary coded decimal numbers, hamming code for error, correction, alphanumeric codes, Boolean Algebra.

Module II: Algebra for Digital systems (8 Hours)

Binary addition, binary subtraction, complement representation of numbers, addition/ subtraction of numbers in 1's complement Notation, addition/subtraction of numbers in 2's complement Notation, binary multiplication, multiplication of signed numbers, binary division, arithmetic with binary coded decimal numbers, representation of integers, Floating point representation of numbers, Floating point arithmetic.

Module III: Logic gates and Boolean Algebra (7 Hours)

Introduction to Basic logic gates (AND, OR, NOT, NOR, NAND), Truth tables, simplification of truth tables, the K-map method, SOP and POS simplifications, Quine-McCluskey tabulation method.

Module IV: Combinational logic and Sequential logic (15 Hours)

Combinational logic: Introduction, Combinational circuits, Analysis procedure, design procedure Binary Adder-Subtractor, Decimal adder, binary multiplier, Magnitude comparator, decoders, encoders, multiplexers, HDL models and Combinational Circuits

Sequential logic: Introduction, Sequential circuits, Storage elements: Latches, Storage elements: Flip-flops, Analysis of clocked sequential circuits, State reduction and Assignment, Design procedure.

Module V: Digital integrated circuits (10 Hours)

Introduction, Special characteristics, Bipolar-Transistor characteristics, RTL and DTL circuits, Transistor-Transistor Logic, Emitter-Coupled Logic, Metal-oxide semiconductor, complementary MOS, CMOS transmission gate circuits, Switch-level Modeling with HDL

Module VI: Memories (5 Hours)

Memory types and terminology, read only memory, Semiconductor RAMs, Non-volatile RAMs, Sequential memories, Programmable logic Devices, Magnetic memories, Optical disk memory, Charge coupled devices.

CSDC6071: DIGITAL ELECTRONICS LAB

(2 credits)

Course Outcomes

Recall the truth table of all logic gates. (Remembering)

Explain the working of combinational and sequential logic circuits. (Understanding)

Model the structure and behavior of digital logic circuits using hardware description language. (Applying)

Illustrate the truth table and timing diagram for combinational and sequential logic circuits. (Analysis)

Design combinational and sequential logic circuits for given problem statements. (Creating)

List of Experiments and tool**Experiments**

To study the Truth tables of logic gates

To realize half/full adder and half/full adder subtractor

Simulation with VHDL/VERILOG

Adders
Subtractors
Logic gates
MUX and DEMUX
Encoder and Decoder and
Sequential logic Circuit

CSXXXXX: IT WORKSHOP**(3 credits – 45 hours)****COURSE/LEARNING OUTCOMES**

To make the students aware about the Scilab software environment.

To make the students able to implement the basics of Scilab programming

To make the students able to apply the knowledge of Scilab programming for different engineering applications

To enable the students to learn and apply Scilab Simulink for simulation, analysis and design of the system

Module I (2 hours)

Introduction to Scilab and its benefits. Installing Scilab. Introduction to Toolboxes.

Module II (10 Hours)

Basic functions. Vector Operations, length of a vector, mathematical operations on Vectors such as addition, subtraction and multiplication. Matrix Operations, access the elements of Matrix, determine the determinant, inverse and eigen values of a matrix, special matrices, elementary row operation, Conditional Branching- if, then, else, elseif keyword, for statement, Scripts and Functions, introduction to the file formats in Scilab. script files, sce and. sci, inline functions, Plotting 2D graphs. File Handling- Scilab. User Defined Input and Output in Scilab Input Function

Module III (10 Hours)

Develop Scilab code for different Composite Numerical Integration algorithms. Apply the algorithm to each interval. Numerical methods- Solving Non-linear Equations Solve nonlinear equations using numerical methods, Bisection method, Secant method. Gauss Elimination method algorithm, Gauss Jordan method algorithm, linear equations using iterative methods, Jacobi and Gauss Seidel iterative methods. Develop Scilab code for different Numerical Interpolation algorithms, ODEs using Euler Methods, ODEs using Euler and Modified Euler methods, Xcos, Palette.

Module IV (10 Hours)

Use of Scilab function Karmarkar in Optimization, Plotting continuous and discrete sine waves. Plotting step function. Plotting ramp function, continuous time system: second and higher order, Response plot for step input, sine input and bode plot, discrete time system variable z, first order discrete time system, flts, dscr, ss2tf functions, Use of scifunc block in XCOS, Use of MUX block, Simulating a PID controller using Xcos, Scilab Toolbox for calling external C libraries, Scilab Toolbox for calling Python and its functions.

CSDM221T: DISCRETE MATHEMATICS

(4 credits – 60 hours)

Course Outcomes

Interpret a given logic sentence in terms of predicates, quantifiers, and logical connectives.

(Understanding)

Solve a given problem using deductive logic and prove the solution based on logical inference.

(Applying)

Classify the algebraic structure for a given a mathematical problem. (Analysing)

Evaluate Boolean functions and simplify expressions using the properties of Boolean algebra

(Evaluating)

Develop the given problem as graph networks and solve with techniques of graph theory. (Creating)

Module I: Sets, Relation and Function (14 lectures)

Operations and Laws of Sets, Cartesian Products, Binary Relation, Partial Ordering Relation, Equivalence Relation, Image of a Set, Sum and Product of Functions, Bijective functions, Inverse and Composite Function, Size of a Set, Finite and infinite Sets, Countable and uncountable Sets, Cantor's diagonal argument and The Power Set theorem, Schroeder-Bernstein theorem. Principles of Mathematical Induction: The Well-Ordering Principle, Recursive definition, The Division algorithm: Prime Numbers, The Greatest Common Divisor: Euclidean Algorithm, The Fundamental Theorem of Arithmetic.

Module II: Introduction to Counting (8 lectures)

Basic counting techniques-inclusion and exclusion, pigeon-hole principle, permutation and combination.

Module III: Propositional Logic: (12 lectures)

Syntax, Semantics, Validity and Satisfiability, Basic Connectives and Truth Tables, Logical Equivalence: The Laws of Logic, Logical Implication, Rules of Inference, The use of Quantifiers. Proof Techniques: Some Terminology, Proof Methods and Strategies, Forward Proof, Proof by Contradiction, Proof by Contraposition, Proof of Necessity and Sufficiency.

Module IV: Algebraic Structures and Morphism (14 lectures)

Algebraic Structures with one Binary Operation, Semi Groups, Monoids, Groups, Congruence Relation and Quotient Structures, Free and Cyclic Monoids and Groups, Permutation Groups, Substructures, Normal Subgroups, Algebraic Structures with two Binary Operation, Rings, Integral Domain and Fields. Boolean Algebra and Boolean Ring, Identities of Boolean Algebra, Duality, Representation of Boolean Function, Disjunctive and Conjunctive Normal Form

Module V: Graphs and Trees (12 lectures)

Graphs and their properties, Degree, Connectivity, Path, Cycle, Sub Graph, Isomorphism, Eulerian and Hamiltonian Walks, Graph Colouring, Colouring maps and Planar Graphs, Colouring Vertices, Colouring Edges, List Colouring, Perfect Graph, definition properties and Example, rooted trees, trees and sorting, weighted trees and prefix codes, Bi-connected component and Articulation Points, Shortest distances.

CO 2		H			
CO 3			H		
CO 4			M	H	
CO 5					H

CSCO222T: COMPUTER ORGANIZATION & ARCHITECTURE

(3 credits – 45 hours)

Course Outcomes

The key components of a CPU and how the instructions are executed. (Understanding)

The need for memory hierarchy and efficiency achieved due to the use of cache. Execution and time taken by instructions in a pipelined processor. (Understanding)

Compare and Analyse different styles, strategies and formats adopted for designing the instruction set, register set, memory organization and I/O transfer. (Analysing)

Construct and organize a new architecture by considering various design issues to make it more efficient with less overhead. (Creating)

Module 1 (6 hours)

Role of abstraction, basic functional units of a computer, Von-Neumann model of computation, A note on Moore's law, Notion of IPC, and performance. Data representation and basic operations.

Module 2 (12 hours)

CPU registers, instruction format and encoding, addressing modes, instruction set, instruction types, instruction decoding and execution, basic instruction cycle, Reduced Instruction Set Computer (RISC), Complex Instruction Set Computer (CISC), RISC-V instructions; X86 Instruction set. Control Unit: Hardwired and Microprogrammed. Micro-operations, execution of a complete instruction. Horizontal and Vertical Microprogramming.

Module 3 (6 hours)

Revisiting clocking methodology, Amdahl's law, Building a data path and control, single cycle processor, multi-cycle processor, instruction pipelining, Notion of ILP, data and control hazards and their mitigations.

Module 4 (9 hours)

SRAM/DRAM, locality of reference, Caching: different indexing mechanisms, Trade-offs related to block size, associativity, and cache size, Processor-cache interactions for a read/write request, basic optimizations like write-through/write-back caches, Average memory access time, Cache replacement policies (LRU), Memory interleaving.

Module 5 (6 hours)

Introduction to magnetic disks (notion of tracks, sectors), flash memory. I/O mapped, and memory mapped I/O. I/O data transfer techniques: programmed I/O, Interrupt-driven I/O, and DMA.

Module 6 (6 hours)

Limits of ILP, SMT processors, Introduction to multicore systems and cache coherence issues.

Suggested Readings

William Stallings, Computer Organization, PHI

CSCO225P: COMPUTER ORGANISATION AND ARCHITECTURE LAB

(2 credits)

Course Outcomes

At the end of the Lab experiments students will be able to:

Recall different OPcodes used in 8086 (Remembering).

Recall the syntax of 8086 assembly language (Remembering).

Illustrate the syntax of 8086 assembly language (Understanding).

Categorize different types of OPcodes (Analysing).

Choose the appropriate method to write an 8086 assembly program (Evaluating).

Module1:

Dismantling and assembling a PC along with study of connections, ports, chipsets, SMPS etc.

Module2:

Assembly language programming using IA32(gcc) I. Introduction gcc assembly programming II. Verification of Instruction Set. III.Arithmetic operations

Module3:

Addition, Subtraction, Multiplication and Division of two 8-bit numbers.

Multi byte Addition and Subtraction, Multiplication and Division – Signed and unsigned Arithmetic operation, ASCII – arithmeticoperation.

Module4:

Logic operations – Shift and rotate – Converting packed BCD to unpacked BCD, BCD to ASCII conversion.

By using string operation and Instruction prefix: Move Block, Reverse string, Sorting, Inserting, Deleting, Length of the string, String comparison.

DOS/BIOS programming: Reading keyboard (Buffered with and without echo) – Display characters, Strings.

Alternative NPTEL/SWAYAM Course

CSD&223T: DESIGN & ANALYSIS OF ALGORITHMS

(3 credits – 45 hours)

Course Outcome

Know the importance of analysis of an algorithm and the basic concepts of time and space complexity analysis of algorithms. (Remembering)

Understand standard computational problems, their best solutions and correctness, the main algorithm designing techniques and recognize similar problems. (Understanding)

Apply mathematical foundations and algorithmic principles to algorithm design in a way that demonstrates comprehension of the trade-offs involved in design choices. (Applying)

Analyze asymptotic runtime complexity of algorithms including formulating and solving recurrence relations. (Analyzing)

Assess various algorithms in terms of correctness, computation cost and memory space used. (Evaluating)

Build algorithmic algorithms (in a programming language) for given problems by using the most appropriate algorithmic strategy considering the domain. (Creating)

Module I (9 hours)

Basic Concepts of Algorithms: Introduction, Notion of Algorithm, Fundamentals of Algorithmic Solving, Important Problem types, Fundamentals of the Analysis Framework – Asymptotic Notations and Basic Efficiency Classes.

Mathematical Aspects and Analysis of Algorithms: Mathematical Analysis of Non-recursive Algorithm, Mathematical Analysis of Recursive Algorithm – Example: Fibonacci Numbers, Empirical Analysis of Algorithms, Algorithm Visualization. (12 hours)

Module II (9 hours)

Analysis of Sorting and Searching Algorithms: Brute Force – Selection Sort and Bubble Sort – Sequential Search and Brute-force string matching – Divide and conquer – Merge Sort – Quick Sort. Randomized divide and conquer algorithms: randomized quicksort and selection.

Binary Search – Binary tree – Traversal and Related Properties – Decrease and Conquer – Insertion Sort – Depth first Search and Breadth First Search.

Module III (10 hours)

Algorithmic Techniques: Transform and conquer – Presorting – Balanced Search trees – AVL Trees – Heap and Heapsort – Dynamic Programming – Warshall's and Floyd's Algorithm – Optimal Binary Search trees – Greedy Techniques – Prim's Algorithm – Kruskal's Algorithm – Dijkstra's Algorithm. Ford Fulkerson algorithm or maximum flow. Max-flow min cut theorem.

Huffman trees. Branch and Bound and Backtracking methodologies for the design of algorithms; Illustrations of these techniques for Problem-Solving.

Module IV (9 hours)

Tractable and Intractable Problems: Models of computation, Turing machines, RAM model. Computability of Algorithms, Decision vs optimization, Computability classes – P, NP, NP-complete and NP-hard. Cook's theorem, Standard NP-complete problems and Reduction techniques.

Module V (8 hours)

Advanced Topics: Approximation algorithms, Randomized algorithms, Class of problems beyond NP – P SPACE

Suggested Readings

Introduction to Algorithms, 4th Edition, Thomas H Cormen, Charles E Lieserson, Ronald L Rivest and Clifford Stein, MIT Press/McGraw-Hill.

Fundamentals of Algorithms – E. Horowitz et al.

Algorithm Design, 1st Edition, Jon Kleinberg and Éva Tardos, Pearson.

Algorithm Design: Foundations, Analysis, and Internet Examples, Second Edition, Michael T. Goodrich and Roberto Tamassia, Wiley.

Algorithms – A Creative Approach, 3RD Edition, Udi Manber, Addison-Wesley, Reading, MA.

CSD&226P: DESIGN & ANALYSIS OF ALGORITHMS LAB

(2 credits)

COURSE / LEARNING OUTCOMES

On successful completion of the course the students will be able to:

Examine running time and analyze the performance of algorithms. (Remembering)

Learn standard algorithms for fundamental problems. (Understanding)

Apply knowledge of computing and mathematics to algorithm design. (Applying)

Analyze a problem and identify the computing requirements appropriate for its solution. (Analyzing)

Design, implement, and evaluate an algorithm to meet desired needs. (Evaluating)

Create efficient applications by using right algorithm depending on domain. (Creating)

Detailed Syllabus

Implementation and analysis of Sorting algorithms–Bubble, Selection, Insertion, Merge, and Quick Sort.

Implementation and analysis of Linear and Binary Search algorithm (Divide and Conquer).

Implementation and analysis of Quick Sort, Merge Sort, and Heap Sort algorithms

(Divide and Conquer, Recursion).

Implementation and analysis of Factorial and Fibonacci sequence using iteration and recursion

(Recursion).

Implementation and analysis of 0-1 and Fractional Knapsack problem using i) Greedy Method and ii)

Dynamic Programming.

Implementation of Chain matrix multiplication using Dynamic Programming.

Implementation of making a change problem (Coin-change) using Greedy method and Dynamic Programming.

Implementation of Graph Searching (DFS, BFS), MST problem (Prim's algorithm, Kruskal's algorithm),

Shortest path (Dijkstra's algorithm) using Greedy method and Dynamic Programming.

Implementation of Longest Common Subsequence problem using Dynamic Programming.

Implement N Queen's problem using Back Tracking.

XXXXXXX: ADAVANCED PROGRAMMING

(4 credits-60 Hours)

Course Outcomes

Understanding the build system: IDE, tools for testing, debugging, profiling, and source code management.

Students are able to demonstrate proficiency in object-oriented programming.

Identify and abstract the programming task involved for a given programming problem.

Learning and using language libraries for building large programs.

Ability to apply defensive programming techniques (e.g., assertions, exceptions).

Desirable/Advanced:

Ability to implement basic event-driven programming.

Understanding of the fundamentals of parallel programming.

Understanding of the basics of cloud computing

Module I: Familiarity with the programming environment (4 hours)

Understanding the build system, , IDE, debugging, profiling , (Eclipse TPTP / gprof / VTune etc.), and source code , management

Module II: Basic principles of the object-oriented development process (6 Hours)

Introduction to Object-Oriented , Paradigm: Data encapsulation, ,modularity, code reuse, identifying classes, attributes, , methods and objects, class , relationships

Module III: Advanced features of OOP (12 Hours)

Interfaces, inheritance, polymorphism, abstract classes, immutability, copying and cloning objects

Module IV : Unit testing (2 Hours)

Unit testing, developing test suite

Module V: Using language APIs (6 Hours)

Language supported libraries for handling advanced data structures

Module VI : Defensive programming (6 Hours)

Exception handling, assertions

Module VII : Modeling and Design patterns (12 Hours)

Basic modeling techniques – e.g. Class diagram, sequence diagram, use case diagrams, etc. Introduction to design patterns: iterator, singleton, flyweight, adapter, strategy, template, prototype, factory, façade, decorator, composite, proxy, chain of responsibility, observer, state)

Suggested text books:

CSIT332T: INTRODUCTION TO DATABASE SYSTEMS

(3credits-45Hours)

Course Objectives

Course Outcomes

Define the fundamental concepts necessary for designing, using and implementing database systems and applications. (Remembering)

Understanding of internal working of a DBMS including data storage, indexing, query processing, transaction processing, concurrency control and recovery mechanisms. (Understanding)

Ability to design and implement database schema for an application using RDBMS concepts. (Creating)

Ability to write SQL queries for tasks of various complexities. (Applying)

Ability to write an application program that uses a database system as the backend. (Applying)

Module I (3Hours)

Database System Architecture - Data Abstraction, Data Independence, Data Definitions and Data Manipulation Languages. Introduction to Data Models (Relational, Semi structured, ER)

Module II (5Hours)

Relational Data Model, Relational Algebra, Relational Calculus or Connection to First Order Logic (Optional)

Module III (9Hours)

DDL, Insert/Delete/Update, Simple Queries (select/project/join/ aggregate queries), Complex queries

(With Clause, Nested Subqueries, Views), Programming in a standard language and interfacing with a DB backend

Module IV (3Hours)

Key-value Stores and Semi- structured Data, using JSON and MongoDB, or other combinations

ModuleV(6Hours)

Introduction to ER model, Mapping from ER to relational model, Functional Dependencies, Normalization (BCNF, Optionally 3NF)

Module VI (6Hours)

Overview of Physical Storage (Hard Disks, Flash/SSD/RAM), sequential vs random I/O, Reliability via RAID, Storage Organization (Records, Pages and Files), Database Buffers, Database Metadata, Indexing, B+-Trees

ModuleVII (6Hours)

Query Processing: External sort, Joins using nested loops, indexed nested loops, Overview of Query Optimization: equivalent expressions, and concept of cost- based optimization.

ModuleVIII (6Hours)

Concept of transactions and schedules, ACID properties, Conflict-serializability, Concurrency control: locks, 2PL, Strict 2PL, optional: isolation levels, Recovery using undo and redo logs

SuggestedReadings

Database System Concepts, 7th Edition, Silberschatz, Korth and Sudarshan, McGraw-Hill. Indian Edition released 2021

Fundamentals of Database Systems, 7th Edition, Elmasri and Navathe, Pearson Pubs, 2017

Principles of Database Management, Lemahieu, Broucke and Baesens, Cambridge University Press, 2018

Database Management Systems, RP Mahapatra, Khanna Publishing House, 2020.

Database Management Systems, Krishnan, McGraw Hill.

CSIT335P: INTRODUCTION TO DATABASE SYSTEMS LAB

(2credits-30Hours)

Module I (2Hours)

Simple pen + paper, and using Relax Relational Algebra calculator in browser

Module II(6Hours)

Laboratory exercises where students write SQL queries for various tasks.

Platform can be PostgreSQL preferably, or MySQL. W3Schools/SQLite in web browser can also be used but beware of non-standard SQL features.

Practice interfacing with a database from a program using connectors like JDBC/ODBC

Module III(4Hours)

Small exercises on MongoDB

Module IV(6Hours)

Exercise in ER design for an application starting with natural language description

Convert ER design to tables

Pen-and-paper exercises with FDs and normalization

Module V (4Hours)

Use a B+-tree visualization system to understand how B+- trees work

Module VI (4Hours)

Examine query plans for sample queries by using the Explain feature of database systems.

Small exercises to show benefit of indices.

Module VII(4Hours)

Pen-and-paper exercises on conflicts, cycles, conflict serializability, recoverability, etc.

**CSML333T: MACHINE LEARNING
(3credits-45Hours)****Course Objectives****Course Outcomes**

Understanding popular ML algorithms with their associated mathematical foundations. (Understanding)

Capability to implement basic algorithms using basic (python) libraries. Have hands-on experience in applying ML to problems encountered in various domains. Have exposure to high level ML libraries or frameworks such as TF, pytorch. (Applying)

Make aware of the role of data in the future of computing and solving real-world problems. (Analyzing)

Helping them connect/map real-world problems to the appropriate ML algorithm(s) to solve them. (Applying)

Appreciate the mathematical background behind the popular ML algorithms. (Evaluating)

Module I (6Hours)

Motivation and role of machine learning in computer science and problem- solving, Representation (features), linear transformations, Appreciate linear transformations and matrix vector operations in the context of data and representation. Problem formulations (classification and regression). Appreciate the probability distributions in the context of data, Prior probabilities and Bayes Rule. Introduce paradigms of Learning (primarily supervised and unsupervised. Also a brief overview of others)

Module II (12Hours)

PCA and Dimensionality Reduction, Nearest Neighbours and KNN, Linear Regression, Decision Tree Classifiers, Notion of Generalization and concern of Overfitting, Notion of Training, Validation and Testing; Connect to generalisation and overfitting.

Module III (13Hours)

Ensembling and RF, Linear SVM, K Means, Logistic Regression, Naive Bayes

Module IV (14Hours)

Role of Loss Functions and Optimization, Gradient Descent and Perceptron/Delta Learning, MLP, Back-propagation, MLP for Classification and Regression, Regularisation, Early Stopping, Introduction to Deep Learning, CNNs.

Suggested Readings

Ian Goodfellow, Yoshua Bengio, and Aaron Courville Deep Learning MIT Press Ltd, Illustrated edition

Christopher M. Bishop Pattern Recognition and Machine Learning - Springer, 2nd edition

Trevor Hastie, Robert Tibshirani, and Jerome Friedman - The Elements of Statistical Learning: Data Mining, Inference, and Prediction - Springer, 2nd edition

Rajiv Chopra, Machine Learning, Khanna Book Publishing Company, New Delhi

Mapping of COs to Syllabus

Course Outcomes	Module I	Module II	Module III	Module IV
CO1	H	H	H	H
CO2	L	H	H	M
CO3	L	H	M	H
CO4	L	H	H	H
CO5	H	H	H	H

CSXXXXX: MACHINE LEARNING LAB (2credits-30Hours)

Module I (8 Hours)

Experiments/notebooks/code that refresh Python, programming frameworks used for the course

Experiments/Code that allows students to appreciate mathematics and data manipulation. Appreciate

- (a) Features, Representation of the data/real-world phenomena (b) mathematical operations or transformations that manipulate the data (c) plot/visualise the data distributions (say in 2D), (d) Eigen values, eigen vectors, rank of matrices.

Lab/Experiments that appreciate the problem of Classification and problem of Regression

Lab/Experiments that appreciate the notions related to “Training” and “Testing” by considering algorithms like decision trees, nearest neighbour as black boxes.

Module II (8Hours)

Dimensionality Reduction using PCA and its applications in (a) removing irrelevant features (b) compression/compaction (c) efficient ML pipeline

Experiment related to Nearest neighbour classifier, (a) visualize the decision boundaries (b) appreciate the role of hyper parameter K. Role of validation data in choice of hyper parameters

Decision Tree as a classifier and see the overfitting with “deep” trees. How the overfitting can be controlled by seeing validation performance during the training.

Module III (6Hours)

Experiments related to K- Means, by varying in “K”, “initialization”. How the “analysis of the algorithm” can be seen in the lab (e.g. change of objective across iterations). Try multiple datasets. Appreciate that “unsupervised discovery” makes sense in the problem under consideration.

An experiment that demonstrates how SVM can yield a solution better than a simple linear separating solution. Appreciate the role of support vectors. Appreciate how SVMs extend to problems even if data is not linearly separable.

An experiment that makes students appreciate the utility of naive Bayes classifier in practice (say designing a text classifier).

Module IV (8Hours)

Experiment that exposes the GD and BP in simple neural networks. Show the learning process (graphs) and performances.

Experiment that use a modern library and implementation of a deep neural network, expose computational graphs, expose the generalized way of appreciating BP as a learning algorithm in Deep Neural Networks

Experiment that uses a popular CNN architecture for practical application (say image classification).

Experiments that strengthen the empirical skills in training with (a) initializations (b) update strategies (c) regularisation (d) multi fold validation on a small/medium size deep neural network that can be trained in 5 minutes.

CO3	L	H	M	H
CO4	L	H	H	H
CO5	H	H	H	H

CSOS334T: OPERATING SYSTEMS (3credits-45Hours)

Course Objectives

Course Outcomes

Module I (8 Hours)

Elaborate what operating systems are, what they do and how they are designed and constructed. (Creating)

Define process concept like process scheduling, inter-process communication, process synchronization

and concurrency. (Remembering)

Explain different memory management schemes, relate various approaches to memory management and effectiveness of a particular algorithm. (Understanding)

Identify different page replacement algorithms to solve problems. (Applying)

Explain how the file system, mass storage and I/O are handled in a modern computer system. (Remembering, Understanding)

Module I (1 hour)

Application requirements, the systems stack and role of OS, resources, abstractions and interfaces, Components overview of an OS, Examples of different types of OSes (RTOS vs. desktop vs. mobile etc.), OS and OS distributions.

Module II (2 hour)

Basic organization of hardware components, Role of OS relative to hardware functionality with examples related to the von Neumann architecture.

Module III (6 hour)

Process abstraction --- program vs. process, Process Control Block (PCB), Design of system calls --- invocation and basic OS handling, Process control system calls, fork, wait, exec, getpid, getppid and variants. The limited direct execution model.

Module IV (10 hour)

Address bus and memory access. Memory view of a process -- heap, stack, code, data, Process memory usage requirements, The address space abstraction using virtual memory and related system calls (mmap, munmap, sbrk, mprotect), Address translation mechanisms --- static mapping, segmentation, paging. Page faults, page sharing, read/write permissions, swapping, process vs. OS memory. Memory bookkeeping and management --- motivation and mechanisms (process and OS). Case studies --- (i) malloc and (ii) role of OS for program to process

Module V (6 hour)

The process lifecycle--- source code to execution. The OS mode of execution -- limited direct execution recap, interrupts, system calls. The process context switch mechanism and PCB state, Scheduling policies --- set of scheduling metrics, goals and examples (interactive vs. real-time, priority).

Module VI (11 hour)

Motivation --- application, process and OS use cases. Introduction to threads and the pthread API. Synchronization primitives --- limitations of software solutions, atomic instructions, test-and-set, spinlocks, mutexes, condition variables, semaphores. Introduction to the pthread synchronization API, Case studies --- producer- consumer, reader-writers, barriers, Discussion on issues with concurrency --- race conditions, deadlocks, order violation.

Module VII (9 hour)

Persistence and the File abstraction, Hardware view: Hard disk architecture and its interfacing, Process view: System calls for file handling, Roles and responsibilities of file system. File system design details-- file and file system metadata, directory structure, caching optimizations, File System case study (the Unix file system etc.)

CSOS336P: OPERATING SYSTEMS LAB (2credits-30Hours)

Module I (10 hour)

1. Usage of tools --- unix shell commands (file commands, ps, ls, top), text editor (nano, vi, gedit, emacs)
2. C programming language refresher --- header files, compilation and linking using GCC, program execution, functions, argument passing, structures, pointers, file handling.

Module II (10 hr)

1. Usage of tools --- GCC, GDB, Objdump, shell scripts
1. Simple strace usage to showcase different interfaces (stdlib, system call)
2. Tools usage --- ps, pstree, top
3. Usage of process control system calls to identity process identifiers, create process hierarchies, launch new executables, control exit sequence of parent and child processes.
4. Familiarity with files in the /proc/<pid>/ directory

Module III (10 hour)

1. (Virtual) addresses of variables and initialized pointers.
2. Use of malloc() and demonstration of per-process virtual addresses
3. Tools usage --- strace, free, top, htop, vmstat,
/proc/<pid>/maps
4. Free memory statistics correlated with malloc(). Number of system calls and malloc() usage.
5. Implement a custom memory allocator using system calls.

Module IV (10 hour)

1. User mode programs to demonstrate LDE
2. Demonstration of process execution interleaving in different orders
3. Simulation based analysis of scheduling policies
4. Tools usage --- nice,

/proc/<pid>/status

Module V (10 hour)

1. Creation of threads using the pthread API and modification of shared variables with and without synchronization
2. Using spinlock, mutexes and condition variables to implement semaphores, barriers (using the pthreads API)
3. Implement solutions to the producer-consumer, reader- writers problems using the different synchronization primitives
4. Develop synchronization solutions for applications that use shared data (e.g., ordering of threads, concurrent hash tables, etc.)
5. Optional: Using shared memory and semaphores implement synchronized access to a shared memory area across processes (e.g., a message queue).

Module VI (10 hr)

1. Tools usage --- state, file, du, df, fsck.
2. Implementation of file utilities (e.g., find, grep) using the system call API.
3. Implement a simple file system to handle files on an emulated disk (via a large file) --- file system API, superblock, inode and data block management.

CSCN340T: COMPUTER NETWORKS

(3 credits-45 Hours)

Course Objectives

This course aims to provide a comprehensive understanding of the fundamentals of computer networks, including Internet architecture, key protocols, and performance metrics. Students will explore application layer protocols, transport and IP layers, and data link and wireless networks. The course also covers advanced topics such as software-defined networking, data center networking, and mobile data networks, enabling students to analyze and evaluate network performance and security measures.

Course Outcomes

Identify and recall fundamental concepts and terminologies related to Internet architecture, including browser, web server, URL, domain name, IP address, and packet switching. (Remembering)

Explain the working principles of wireless networks, SDN, and layers in the OSI and TCP/IP models. (Understanding)

Apply socket programming techniques to create simple client-server applications using TCP and UDP. (Applying)

Compare and contrast the features and functionalities of IPv4 and IPv6, layers in the OSI and TCP/IP models, and different security schemes such as NATs, firewalls, and DMZs. (Analyzing)

Evaluate different security measures, and congestion control mechanisms used in TCP, such as slow start and congestion avoidance, and their effectiveness in managing network traffic. (Evaluating)

Design and develop a comprehensive network topology for a data center, and strategies for implementing wireless network protocols. (Creating)

Module I (3 Hours)

Introduction to the Internet: Overview of how the Internet works. Understand at a high level what happens when we browse a website. Understand basic terminology like browser, web server, URL, domain name, IP address, packets. Overview of the design principles of the Internet: packet switching vs circuit switching, store-and-forward networks, layering for modularity. Introduction to the various layers in the Internet. Introduction to performance metrics like end-to-end throughput, delay, jitter and drop rates in a network. Statement of Little's Law. How performance is measured.

Module II (7 Hours)

Application layer: Internet names, how DNS works. Application layer protocols: HTTP, SMTP, SNMP, web applications. Peer-to-peer applications. P2P file distribution. Audio and video streaming. Challenges of streaming over best effort IP. Linux Network Programming: Introduction to socket programming in Linux. Understand how to build a simple client-server application using TCP/UDP sockets.

Module III (8 Hours)

Transport Layer: Importance of the transport layer; end-to-end principle. Transport layer protocols: basics of TCP and UDP, process-to-process delivery, multiplexing, port numbers, header structure. Reliable transmission of packets over an unreliable network: sequence numbers, ACKs, timeout, retransmissions. Stop and wait, and sliding window. TCP connection setup and teardown. Flow control and congestion control at the transport layer. Differences between the two. Overview of TCP congestion control: Slow start and reaction to timeouts. TCP congestion control: Slow start; congestion avoidance using loss-based and delay-based control.

Module IV (10 Hours)

The IP Layer: Network architecture and performance - Network topology; Router architecture: queueing and switching. Performance evaluation of a network link: traffic characteristics, performance measures, Kendall's notation. IP Protocol - Need for an Internet address, and its design. Hierarchical IP addressing, IPv4 and IPv6, structure of IP datagram, IP forwarding. NATs, security attacks and defences: DMZ, firewalls. Routing protocols and Internet architecture: Routing protocols: Link state routing. Distance vector routing: count-to-infinity, routing convergence. Understand the structure of the Internet: end-user organizations and ISPs. Understand the difference between intra-domain (OSPF) and inter-domain (BGP) routing. Intra-domain routing: OSPF.

Module V (10 Hours)

Data Link Layer - Mechanisms for error detection/recovery: Parity checks, CRC. Medium access protocols: Polling vs. contention-based: TDM, Aloha, CSMA/CD. Switched LANs: L2 addressing and ARP, Ethernet frame structure, learning switches. Wireless Networks: Wireless physical layer: signal-to-noise ratio, bit error rate, modulation, multipath, interference. Wireless LANs: 802.11 architecture (access points, SSID, channels, beacons, scanning, association), 802.11 CSMA-CA protocol; summary of 802.11 variants.

Module VI (7 Hours)

SDN and data center networking: Data center network design and topology. Transport protocols optimized for data centers. Introduction to software defined networking. Mobile data networks: Cellular Internet access. Mobility management and handovers. Impact of mobility on higher layers. Streaming media protocols and services: Multimedia applications. Audio and video streaming over UDP, HTTP. Adaptive streaming. Voice over IP. Recovering from packet loss and jitter. QoS. Protocols for real time applications.

CSCN345P : COMPUTER NETWORKS LAB

(2 credits-60 Hours)

Course Objectives

This lab course is designed to offer hands-on experience with network configuration and analysis using Linux tools and Wireshark. Students will develop practical skills in socket programming, network performance measurement, and simulation of network protocols using NS-2/NS-3. The course includes tasks such as setting up mesh networks, evaluating wireless and cellular signal strength, and implementing streaming servers, fostering a deeper understanding of real-world networking scenarios.

Course Outcomes

Recall and identify various Linux networking tools and commands such as ifconfig, dig, ethtool, route, netstat, nslookup, and ip to understand network configurations. (Remembering)
 Understand and describe the principles of socket programming by developing simple client-server programs using TCP and UDP. (Understanding)
 Apply Linux utilities such as iperf and tc to measure and modify TCP throughput and observe the impact of network configurations on performance. (Applying)
 Examine and interpret link layer packet statistics and errors using Linux tools like ethtool and simulate medium access protocols using NS-2/NS-3. (Analyzing)
 Evaluate the performance of various network configurations and congestion control protocols using NS-2/NS-3 simulations and tools like iperf. (Evaluating)
 Develop and simulate transport protocols optimized for data centers using NS-2/NS-3, set up static routes in a mesh network to achieve desired topology, and implement streaming audio/video server. (Creating)

Module I

Use Linux tools like ifconfig, dig, ethtool, route, netstat, nslookup, and ip to understand the networking configuration of the computer that the student is working on. Use Wireshark to capture packets when browsing the Internet. Examine the structure of packets: the various layers, protocols, headers, payload. Install and configure some network applications, e.g. Apache, Bind (DNS), etc. Understand various header fields and their usage in different application layer protocols using Wireshark packet capture.

Module II

Socket programming: write a simple client- server program using TCP and UDP sockets. Modify server to handle multiple clients concurrently. Measure TCP throughput between two hosts in a network using tools like iperf. Modify TCP configuration parameters. Use the tc Linux utility or similar to control bandwidth, delay, loss. Observe impact on measured throughput. Experiment with multiple applications running concurrently to generate congestion. Observe the behaviour of congestion control protocols in NS-2/NS-3, change various network parameters and observe evolution of the TCP congestion window.

Module III

Use tools like ping and traceroute to explore various Internet paths to popular servers. Use web-based tools like the whois utility to query Internet registries, and understand which IP addresses are allocated to the student's network. Find out which are the major ISPs, and which is the ISP of the student's network. Configure a simple mesh network using computers in the lab, or using Mininet. Setup static routes to conform to the desired mesh topology. Use NS-2/NS-3 to simulate a mesh of at least 4 nodes and 3 links to evaluate performance under various conditions.

Module IV

Use Linux network tools like ethtool to observe and analyze link layer packet statistics and errors. Use NS-2/NS-3 to simulate medium access protocols. Observe contention, collisions and packet loss in medium access protocols. Observe the working of error detection/recovery mechanisms. Use cellphone to measure Wi-Fi signal strength (RSS) at various places in the campus. Draw a contour map with access points and RSS levels. Correlate with upload/download speed using tools like Measurement Lab speed test. Understand the behavior of Wi-Fi using NS-2/NS-3.

Module V

Simulate transport protocols optimized for data centers in NS-2/NS-3. Use cellphone to measure cellular signal strength (RSS) at various places in the campus. Draw a contour map with cellphone towers and RSS levels. Correlate with upload/download speed using tools like Measurement Lab speed test.

Module VI

Implement a streaming audio/video server using open-source software.

CSIC341T : INTRODUCTORY CYBER SECURITY

(3 credits-45 Hours)

Course Objectives

The objective of the Cyber Security Theory course is to provide students with a comprehensive understanding of the fundamental principles of cyber security, including the CIA triad, cryptographic techniques, authentication and authorization mechanisms, and application security vulnerabilities. Students will learn to analyze recent cyber-security incidents, evaluate intrusion detection and prevention systems, and assess the security of mobile applications and wireless networks. The course aims to equip students with the knowledge to design secure systems and develop robust cyber defense strategies.

Course Outcomes

Recall and define key cyber security concepts and terminology, including the CIA Triad, cyber-attack surfaces, recent cybersecurity incidents, and different cryptographic methods. (Remembering)

Explain the role of cryptography, strong authentication, and access control mechanisms. (Understanding)

Apply cryptographic techniques to secure data, and utilize security tools such as firewalls and intrusion detection systems to protect networks and detect intrusions. (Applying)

Analyze basic application vulnerabilities, such as buffer overflow, SQL injection, and cross-site scripting (XSS), and propose mitigation techniques and examine network security threats. (Analyzing)

Assess the security of web applications by identifying and mitigating vulnerabilities, and evaluate different classes of malware. (Evaluating)

Design and implement intrusion detection systems, secure communication protocols and develop comprehensive security solutions for mobile applications. (Creating)

Module I (3 Hours)

Introduction and basic terminology: Cyber Security and CIA Triad, basic cyber threats to CIA, cyber-attack surfaces, recent cyber-security incidents and their high-level analysis

Module II (6 Hours)

Basic Cryptography: Role of Cryptography in ensuring confidentiality for data at rest, data in motion, and data in process. Symmetric and Asymmetric Cryptography, their needs as complementary of each other, some basic symmetric and asymmetric algorithm outlines (RSA, DH, DES, AES), Role of cryptography in data integrity, non-repudiation Hashing and Digital Signature and some example hash function outlines (MD5, SHA-256), understanding digital signature and its role. Digital Certificate and PKI. Importance of the role of a proper Pseudo Random Number Generator.

Module III (6 Hours)

Authentication, Authorization and Privilege: Importance of strong Authentication, distinction between authorization and authorization, importance of authorization, access control, Mandatory and Discretionary Access control, role based authorization, privilege and privilege escalation

Module IV (15 Hours)

Application Security: Basic application vulnerabilities (Buffer overflow, Integer Overflow, format string vulnerability), Basic mitigations of buffer overflow – platform bases, compiler based, secure programming practice, Web Client Security, Same Origin Principle, DOM, Java Script Vulnerability, Cookies and Cookie Attributes Secure, http only, Concept of session and session ID, Session hijacking vulnerability, http vs. https and SSL/TLS and version issue, Web Server Security – XSS, CSRF, SQL Injection, Command Injection concepts, examples of each and mitigation techniques Vulnerabilities in DNS, Routing and IP protocols especially in IPv4 and suggested remedies with DNSSEC, S-BGP, and IPSec

Module V (6 Hours)

Perimeter protection and Intrusion Detection: Host Intrusion Detection techniques, what are the indicators to look for and how an SIEM tool can consolidate such indicators into a management console Network Intrusion Detection – signature based vs. behavior based, Snort Firewall vs. Intrusion Detection tool, Firewall rules and customization techniques.

Module VI (9 Hours)

Basic Malware Analysis: Various malware classes and their characteristics, Difference between static analysis and dynamic analysis, Signature vs. behavioral detection techniques. Mobile Application Security: Basic mobile attack surface and the ideas of permissions, and their abuse; Execution model of mobile apps in Android (Sandboxing) and communication. WLAN Security: Some common ways WLAN are compromised including weak cipher such as WEP, evil twin attack, unauthorized access point based attacks (rogue WLAN) etc.

CSIC3460 : INTRODUCTORY CYBER SECURITY LAB

(2 credits - 60 Hours)

Course Objectives

The objective of the Cyber Security Lab course is to offer hands-on experience with key cyber security tools and techniques. Students will practice using cryptographic libraries, implementing two-factor authentication, and performing vulnerability testing for buffer overflows and injection attacks. The course also includes configuring and monitoring intrusion detection systems, analyzing malware, and evaluating the security of mobile and WLAN networks. By the end of the lab course, students will be able to apply theoretical knowledge to practical scenarios, enhancing their skills in securing computer systems and networks.

Course Outcomes

Recall and identify the usage of cryptographic functions such as RSA, AES, and SHA-256 for encryption and hashing. (Remembering)

Explain the process and importance of two-factor authentication, demonstrate an example of privilege escalation, and describe various application vulnerabilities. (Understanding)

Apply cryptographic library functions to encrypt data and hash information, analyze digital certificates, and implement vulnerability testing techniques such as SQL injection, XSS, CSRF, and command injection using DVWA. (Applying)

Analyze the effectiveness of host monitoring by installing and configuring Wazuh to monitor a host, and examine network traffic and detect intrusions by installing and configuring Snort on a local network. (Analyzing)

Evaluate the security of applications by performing static analysis to identify potential vulnerabilities in executables. (Evaluating)

Develop comprehensive monitoring solutions for both hosts and networks using tools like Wazuh and Snort to enhance cybersecurity measures, and implement secure communication protocols using cryptographic techniques in practical applications. (Creating)

Module I

Using library functions to use RSA, AES, SHA-256 and show the result of encryption, Hashing etc. Taking apart a digital certificate and show the various components and their significance.

Module II

2 factor authentication, Privilege escalation example

Module III

Buffer overflow, integer overflow and format string vulnerability testing in vulnerable applications. DVWA based command injection. SQL injection, XSS and CSRF

Module IV

Install Wazuh and monitor a host. Install snort and monitor a network on the local network.

Module V

Use static analysis tools to find how an executable can be analyzed.

CST0344T : THEORY OF COMPUTATION

(4 credits - 60 Hours)

Course Objectives

The objective of the Theory of Computation course is to introduce students to the fundamental concepts and mathematical foundations of computational theory. Students will explore various models of computation, such as finite automata, context-free grammars, and Turing machines, and understand their capabilities and limitations. The course aims to develop the ability to analyze the properties of languages and automata, prove theorems related to computational theory, and classify problems based on their computational complexity. By the end of the course, students will be equipped to tackle advanced topics in computer science and apply theoretical principles to practical problems.

Course Outcomes

Define key concepts of automata theory, including alphabets, formal languages, regular expressions, deterministic and non-deterministic finite automata (DFAs and NFAs).

Explain the relationship between regular expressions and regular languages, and the differences between context-free grammars (CFGs) and context-free languages (CFLs).

Construct deterministic and non-deterministic finite automata for given regular languages and apply the pumping lemma to demonstrate the non-regularity of certain languages.

Analyze the closure properties of regular languages and context-free languages and the differentiate between the acceptance conditions of pushdown automata (PDAs) and their equivalence to CFGs.

Evaluate the decidability and recognizability of problems using Turing machines and assess the complexity of problems and classify them into complexity classes such as P, NP, and EXP.

Design Turing machines to solve specific computational problems and formulate reductions to prove the undecidability and NP-completeness of various problems.

Module I (20 Hours)

Finite Automaton: Why automata theory? Alphabets, formal languages, and problems. What are regular languages and automata models for them: Deterministic Finite automaton, Formal argument of correctness, Regular languages. Properties of regular languages - Closure, properties, product construction. Limitations of Automata Non-regularity, Pumping Lemma. Non-Deterministic Finite Automaton, Subset construction, Equivalence with DFAs. Regular expressions. Equivalence with regular languages. Algorithms for regular languages, Minimization and its algorithm, Myhill-Nerode relations, Characterization of regular languages.

Module II (20 Hours)

Grammars, Context-free Languages and machine models: Grammars and the motivation from language theory. Context-free grammars, closure properties. Chomsky Normal Form for CFGs. PDAs. Empty-stack vs Final state acceptance conditions. Equivalence of PDAs and CFGs. Limitations of PDA computation, non-context-free language. Pumping Lemma for CFLs. Deterministic CFLs and PDAs. CYK Algorithm for parsing of CFLs.

Module III (20 Hours)

Turing machines and Computability: Modeling computation using Turing Machines. Equivalent models. Church Turing Hypothesis. Decidability and Turing recognizability (i.e., recursive and recursively enumerable). Closure properties. Undecidability by diagonalization. Reductions to show undecidability. Examples of reductions. Resource bounded Turing machines & Intro to Complexity. Basic complexity classes. Time bounded classes: P, NP, EXP. Post's correspondence problem and other undecidable problems. Polytime reductions, NP-completeness, Cook-Levin Theorem without proof.

CSCD449T:COMPILER DESIGN

(3credits-45Hours)

Course Outcomes

Recall the role, functionality and structure of program translation and interpretation in software development. (Remembering)

Understand the difference between abstraction levels of a high-level language and a machine language. (Understanding)

Understand the role of a sequence of intermediate representations in lowering the level of abstractions in

the process of language translation. (Understanding)
 Get a first-hand experience of a practical application of elegant data structures, algorithms, and other core CS concepts such as automata theory. (Creating)
 To make effective use of tools such as LEX and YACC. (Applying)

Module I (12 Hours)

Introduction to Compilers: Comparing abstractions of a high-level language and a low-level language; compilation as a series of steps for lowering the abstraction level through stepwise refinement; phases of compilation; bootstrapping; cross-compilation. Lexical Analysis: The role of lexical analysis; Token, lexemes, and token codes; Regular Expressions (RE) to represent tokens, Deterministic finite automata (DFA), Traversing a DFA for recognizing tokens; Generating a lexical analyzer using LEX/Flex.

Module II (14 Hours)

Syntax Analysis: Context Free Grammars (CFG), Concept of parsing, sentences and sentential forms, leftmost and rightmost derivations, parse trees, ambiguous grammars; Overview of top-down and bottom-up parsing;

Option 1: Introduction to shift reduce parsing; viable prefixes and valid items, Constructing LR(0) sets of items; Constructing SLR parsing tables; Generating a parser using a parser generator such as YACC/Bison.

Option 2: Top-down parsing, Left factoring, Elimination of left-recursion, predictive parsing, recursive descent parsing, LL(1) parsing. Generating a parser using a parser generator such as ANTLR, JavaCC, etc.

Module III (8 Hours)

Semantic Analysis: The need of semantic analysis; abstract syntax trees for expressions, assignment statements and control flow statements; attribute evaluation, syntax directed translation schemes (SDTS); Applications of Semantic Analysis: Applications of SDTS for (a) declaration processing and type checking, (b) generating three-address code

Module IV (5 Hours)

Run time support: Parameter passing by value, reference, and name; activation records, stack and static allocation of activation records; translating a function call, allocating offsets to variables, generating code for function prologue, function epilogue, call sequence, and return sequence.

Module V (6 Hours)

Introduction to Code Optimization: Control flow graphs; Local optimizations (common subexpression, copy propagation, dead code elimination). Code Generation: Generating assembly code from three address codes using simple register allocation and instruction selection.

CSCD452P: COMPILER DESIGN LAB

(2 Credits)

Course Outcomes

Recall and illustrate the different syntax of compiler construction tools like LEX and YACC. (UNDERSTANDING)

Experiment with regular expression to match the pattern. (APPLYING)

Solve various problem using LEX and YACC. (CREATING)

Interpret the techniques of parsing practically. (UNDERSTANDING)

Analyze different rules using standard parser generator YACC. (ANALYZING)

Evaluate problems using both SPIM Simulator. (EVALUATING)

List of Experiments:

Write 5 simple test-cases in MMC and then inspect the generated code.

Write a lexer to recognize valid tokens.

Write a parser to parse the given input MMC program.

Write a type-checker for a syntactically correct input MMC program.

Write a Translator that takes a type-checked MMC program and generates equivalent IR code in TACoC format; TACoC is a subset of MMC such that code is in a form similar to three-address code. Details of TACoC is given towards the end of this section.

Generate MIPS code. Use the SPIM simulator to run the code.

Write a translator to translate a type-checked MMC program to equivalent three-address code.

CSBI453T: BIOLOGY

(3credits-45Hours)

Course Outcomes

Compare the two, three, four and five kingdom classifications. Highlight the criteria for classification (Understanding)

Apply thermodynamic principles to biological systems. (Applying)

Analyze biological processes at the reductionist level. (Analyzing)

Examine DNA as a genetic material in the molecular basis of information transfer (Evaluating)

Module I: Classification (8hours)

Classification and its criteria: Morphological, Biochemical and Ecological; Hierarchy of

Classifications, based on (a) cellularity- Unicellular or multicellular (b) ultrastructure- prokaryotes or eucaryotes. (c) energy and Carbon utilization -Autotrophs, heterotrophs, lithotrophs (d) Ammonia excretion – amonotelic, uricotelic, ureotelic (e) Habitata- aquatic or terrestrial (e) Molecular taxonomy- three major kingdoms of life; Organism from different based on classification for the study :1. E.coli, 2. S.cerevisiae, 3. D. Melanogaster, 4.C. elegans, 5. A. Thaliana, 6. M. musculus

Module 2: Genetics and Information Transfer (13 hours)

a. Mendel's laws: Law of segregation and Law of independent assortment, Dominance, Recessiveness; Allele, Gene mapping, Gene interaction, Epistasis ; Meiosis and Mitosis in heredity; Gene – mapping; Genetic disorders in humans; complementation in human genetics.

b. DNA as a genetic material; Structure of DNA- single stranded, double stranded and nucleosomes; Genetic code- Salient features; Gene - complementation and recombination.

Module 3: Biomolecules and Enzymes (14 hours)

a. Biomolecules of life: Micromolecules and Macromolecules- sugars, starch and cellulose; Amino acids and proteins; Nucleotides and DNA/RNA; Two carbon units and lipids. Structure of proteins: Primary, Secondary, tertiary and Quaternary; Proteins as enzymes, transporters, receptors and structural elements.

b. Enzyme classification. Mechanism of enzyme action of any two enzyme. Enzyme kinetics and kinetic parameters; RNA catalysis.

Module 4: Metabolism (6hours)

Thermodynamics as applied to biological systems. Exothermic and endothermic versus endergonic and exergonic reactions. ΔG and its relation to standard free energy. Spontaneity. ATP as an energy currency; Glycolysis and Krebs cycle; Photosynthesis; Energy yielding and energy consuming reactions. Energy charge

Module 5: Microbiology (4 hours)

Unicellular organisms; Species and strains. Identification and classification of microorganisms. Microscopy. Ecological aspects of unicellular organisms. Sterilization and media compositions. Growth kinetics.

Suggested Readings

Biology: A global approach: Campbell, N. A.; Reece, J. B.; Urry, Lisa; Cain, M. L.; Wasserman, S. A.; Minorsky, P. V.; Jackson, R. B. Pearson Education Ltd

Outlines of Biochemistry, Conn, E.E; Stumpf, P.K; Bruening, G; Doi, R.H., John Wiley and Sons

Principles of Biochemistry (V Edition), By Nelson, D. L.; and Cox, M. M.W.H. Freeman and Company

Molecular Genetics (Second edition), Stent, G. S.; and Calendar, R.W.H. Freeman and company, Distributed by Satish Kumar Jain for CBS Publisher

Microbiology, Prescott, L.M J.P. Harley and C.A. Klein 1995. 2nd edition Wm, C.Brown Publishers

Mapping of COs to Syllabus

CO2				M	
CO3	M		M	H	H

CO4	M	H	H		

CSEC0163: E-COMMERCE & CYBER SECURITY

(3 credits – 45 hours)

Course Outcomes

Find the scopes of e-commerce and their association with different trade cycles.

Summarize the concept of business to consumer mode of transaction in e-commerce.

Present the legal issues associated with electronic documents, jurisdiction issues, copyrights etc.

Explain and categorize the in-depth knowledge of EDI and its constituent elements.

Evaluate the symmetric and asymmetric cryptosystem implementations on e-commerce.

Integrate the gathered knowledge on certain case studies like internet bookshops, electronic newspapers, virtual auctions etc.

Module 1(10 hours)

Definition, Scope of E-Commerce, Hardware requirements, E-Commerce and Trade Cycle, Electronic Markets, Electronic Data Interchange and Internet Commerce. Business to Business E-Commerce: Electronic Markets, Electronic Data Interchange (EDI): Technology, Standards (UN/EDIFACT), Communications, Implementations, Agreements, Security, EDI and Business, Inter- Organizational E-commerce.

Module 2(15 hours)

Risks-Paper Document vs. Electronic document, Authentication of Electronic document, Laws, Legal issues for Internet Commerce: Trademarks and Domain names, Copyright, Jurisdiction issues, service provider liability, Enforceable on line contract. Security Issues: Security Solutions-Symmetric and Asymmetric Cryptosystems, RSA, DES, AES and Digital Signature, Protocols for secure messaging, Secure Electronic Transaction (SET) Protocol, Electronic cash over internet, Internet Security.

Module 3 (10hours)

Consumer trade transaction, Internet, Page on the Web, Elements of E-Commerce with VB, ASP, SQL.

Module 4 (10 hours)

Internet bookshops, Software supplies and support, Electronic Newspapers, Internet Banking, Virtual Auctions, Online Share Dealing, Gambling on the net, E-Diversity, Case studies through internet.

Suggested Readings

D. Whitley, E-Commerce-Strategy, Technologies and Applications, TMH.

K. K. Bajaj, E-Commerce- The Cutting Edge of Business, TMH.

W. Clarke, E-Commerce through ASP, BPB.

M. Reynolds, Beginning E-Commerce with VB, ASP, SQL Server 7.0 and MTS, Wrox.

CO2	L		H	
CO3		H		
CO4	H	M		L
CO5		H		
CO6			L	H

CSIC0164: ICT FOR DEVELOPMENT

(3 credits – 45 hours)

Course Outcomes

Define the various terms and technologies used for Information and Communication System. (Remembering)

Analyze the foundational and implementation issues of ICT.(Analyzing)

Illustrate the various impacts of ICTs on Social and Economical developments. (Understanding)

Classify and compare the models of e-Governance with ICTs and its impact on the Environment sustainability. (Applying)

Conclude and evaluate the various aspects of ICTs in future. (Evaluating)

Module 1: Information and Communication System Overview (12 lectures)

Definition of terms – Elements and Components – Basics of Information theory – Objectives of communications – components and methods of communications – Hardware subsystem (PC, Network, Enterprise, Grid and Cloud Computing) – Internet, Intranet, WEB technology in communication .

Module 2: Foundations and Implementation of ICT4D (7 lectures)

ICT4D value chain, Technological foundations of ICT4D, Human foundations, Institutional foundations, Implementing ICT4D: Strategy, Design and implementation, Adoption, monitoring and use.

Module 3: ICTs for Economic and Social development (11 lectures)

Economic growth: Development goal, ICTs and micro-economic growth, ICTs and meso-economic growth, ICTs and macro- economic growth, Poverty eradication: Development goal, ICTs and financial poverty, ICTs and livelihoods, Social development: Development goal, ICTs health, ICTs education.

Module 4: ICTs for e-Governance and Environment Sustainability (10 lectures)

Good Governance: Development goal, ICTs for e-Services, ICTs for e-Accountability, ICTs for e-Democracy, Environment Sustainability: Development goal, ICTs for e-Mitigation, e-Monitoring, e-Strategy, e-Adaptation, e-Resilience.

Module 5: Future of ICT4D (5 lectures)

Future directions, Development 2.0, Data intensive development, Open development.

Suggested Readings

The Language of ICT: Information and Communication Technology, Tim Shortis, 2001, Routledge.

Information and Communication Technology for Development (ICT4D), Richard Heeks, 2017, Taylor and Francis.

Information and Communications Technologies for Development: A Comparative Analysis of Impacts and Costs, Balaji, P. and Keniston, K

CO1	H				
CO2		H			
CO3		M	H	M	
CO4				H	
CO5					H

CMCG0150: COMPUTATIONAL GEOMETRY

(3 Credits – 45 Hours)

Course Outcomes

Construct algorithms for simple geometrical problems (Applying)

Solve linear programs geometrically (Applying)

Apply geometric techniques to real-world problems in graphics. (Applying)

Analyze randomized algorithms for small domain problems. (Analyzing)

Develop efficient algorithms using line-point duality. (Creating)

Module 1 (11 Hours)

Polygon triangulation: area of a simple polygon, counting the number of triangulations in a convex polygon, Plane sweep -- the general paradigm, Line segment intersection, Doubly Connected Edge List (DCEL), Triangulation of a monotone polygon, Triangulations of Planar Point Sets, The Delaunay Triangulation, Computing the Delaunay Triangulation

Module 2(9 Hours)

Convex hull in 2D -- lower bound, Graham's scan, Jarvis march, output sensitive Chan's algorithm. Range search -- Kd tree, Range tree, Fractional Cascading, Art Gallery theorem. Convex hull in 3D--The Complexity of Convex Hulls in 3-Space, Computing Convex Hulls in 3-Space

Module 3(9 Hours)

Linear Programming: The Geometry of Casting, Half-Plane Intersection, Incremental Linear Programming, Randomized Linear Programming, Unbounded Linear Programs
Arrangements and Duality-- Computing the Discrepancy, Duality, Arrangements of Lines, Levels and Discrepancy

Module 4(10 Hours)

Voronoi Diagrams: The Post Office Problem, Definition and Basic Properties, Computing the Voronoi Diagram, Voronoi Diagrams of Line Segments, Farthest-Point Voronoi Diagrams
Point Location: Knowing Where You Are, Point Location and Trapezoidal Maps, A Randomized Incremental Algorithm, Dealing with Degenerate Cases

Module 5(6 Hours)

Robot Motion Planning: Getting Where You Want to Be, Work Space and Configuration Space, A Point Robot, Minkowski Sums, Translational Motion Planning

Suggested Readings

Computational Geometry: Algorithms and Applications, Mark de Berg, Otfried Cheong, Marc van Kreveld, Mark Overmars, Springer Verlag
Computational Geometry -- An Introduction, Franco Preparata and Michael Ian Shamos, Springer Verlag
Computational Geometry in C, Joseph O'Rourke, Cambridge University Press
Lecture Notes by David Mount - <http://www.cs.umd.edu/~mount/754/Lects/754lects.pdf>

Mapping of COs to Syllabus

CO2			H		
CO3	M	M	M	H	H
CO4				H	
CO5			H		

CSOS0151: ADVANCED OPERATING SYSTEMS
(3 Credits – 45 hours)

Course Outcomes

Define the concepts of concurrent processes, deadlock, process synchronization and list the various conditions for identifying these scenarios. (Remembering)

Explain the advanced terms like distributed deadlock, distributed mutual exclusion and distributed file system etc. (Remembering)

Apply various algorithms like Lamport's algorithm and Ricart- Agarwala algorithm to solve the problem of distributed mutual exclusion. (Applying)

Compare techniques of implementing distributed file systems, distributed shared memory, different load scheduling algorithms like- load balancing and load sharing. (Analysing)

Determine the requirements of security and protection for a computer system and estimate the efficiency of different security models. (Evaluating)

Discuss the design and implementation issues of multiprocessor operating systems. (Creating)

Module I (10 hours)

Concepts of processes, Concurrent processes, Threads, Overview of different classical synchronization problems, Monitors, Communicating Sequential processes (CSP), Process deadlocks: Introduction, causes of deadlocks, Deadlock handling strategies, Models of deadlock.

Module II (11 hours)

Distributed operating system: Architectures, Issues in Distributed operating systems, Limitations of Distributed Systems, Lamport's logical clock, Global states, Chandy-Lamport's global state recording algorithm, Basic concepts of Distributed Mutual Exclusion, Lamport's Algorithm, Ricart-Agrawala Algorithm; Basic concepts of Distributed deadlock detection, Distributed File system, Architecture, Design issues, SUN Network File system, Basic concepts of Distributed shared memory, Basic concepts of Distributed Scheduling, Load balancing, Load sharing

Module III (12 hours)

Multiprocessor System: Motivation, Classification, Multiprocessor Interconnections, Types, Multiprocessor OS functions and requirements; Design and Implementation Issue; Introduction to parallel programming; Multiprocessor Synchronization. Performance, Coprocessors, RISC and data flow: Introduction, Necessity, Measures, Techniques, Bottlenecks and Saturation, Feedback loops, Coprocessors, RISC.

Module IV (12 hours)

Analytic Modeling: Introductions, Queuing Theory, Markov Process. Security and Protection: Security-threats and goals, Penetration attempts, Security Policies and mechanisms, Authentication, Protections and access control Formal models of protection, Cryptography, worms and viruses.

Suggested Readings

Milan Milenkovic, Operating Systems Concepts and Design, TMH.

<https://nptel.ac.in/courses/106108101>

<https://nptel.ac.in/courses/106102132>

CO5				H
CO6			H	M

CSSN0152: SPEECH AND NATURAL LANGUAGE PROCESSING

(3 credits-45Hours)

Course Outcomes

Recall algorithms and methods for building computational models of speech and natural language processing (Remembering)

Explain syntactic analysis, semantic representations, discourse analysis, phonetics, and automatic speech recognition. (Understanding)

Apply statistical and corpus-based methods and algorithms for text and speech processing. (Applying)

Analyse syntactic structure and meaning of given text taking into account ambiguity. (Analysing)

Evaluate the performance of algorithms and models used for text and speech processing. (Evaluating)

Develop natural language and speech processing systems for applications such as information extraction, question answering, machine translation etc. (Creating)

Module I (5 Lectures)

Introduction to NLP, Knowledge in language processing, Representation and Understanding, Organization of NLP systems, Models and algorithms, Linguistic Essentials

Module II (12 Lectures)

Grammars and Parsing - Syntactic Processing: Collocations; Regular Expression and Automata; Morphology and Finite-State Transducers; N-grams; Word Classes and Part-of-Speech Tagging; Context-Free Grammars for English; Parsing with Context-Free Grammars: Top-down parsing, Bottom-up parsing; Features and Unification; Lexicalized and Probabilistic Parsing

Module III (12 Lectures)

Semantic processing: Representing Meaning; Semantic Analysis: Integrating semantic analysis to parsers, Semantic Grammars; Lexical Semantics; Word Sense Disambiguation and Information Retrieval: Selection-Restriction based disambiguation, Machine learning approaches; Dictionary based approaches, Information retrieval

Module IV (7 Lectures)

Pragmatics :Discourse, Dialogue and Conversational Agents: Dialogue acts, Automatic Interpretation of Dialogue acts; Natural Language Generation: Discourse Planning; Machine Translation: Direct Translations, Translation using Statistical techniques

Module V (7 Lectures)

Phonetics: Articulatory Phonetics, Phonetic features, Phonetic variations, Acoustic phonetics and signals; Speech Synthesis: Text normalization, Phonetic analysis, Prosodic analysis; Automatic Speech Recognition: Speech recognition architecture, Feature extraction - MFCC vectors, Search and decoding; Text-to-speech

Module VI (2 Lectures)

NLP Applications and Tools :Sentiment Analysis, Text Summarization, Text Entailment, Machine Translation, Question Answering, Cross Lingual Information Retrieval (CLIR), NLTK, WordNet

Suggested Readings

D. Jurafsky, J. H. Martin, Speech and Language Processing, Pearson Education
 Christopher D. Manning, Hinrich Schütze, Foundations of Statistical Natural Language Processing, The MIT Press,
 Cambridge, Massachusetts
 James Allen, Natural Language Understanding, 2/e, Pearson Education

CSCG6100: COMPUTATIONAL GEOMETRY LAB (credits)

Course Outcomes

Construct algorithms for simple geometrical problems (Applying)

Apply geometric techniques to real-world problems in graphics. (Applying)

Analyze computational geometrical algorithms for small domain problems. (Analyzing)

Develop efficient computational geometrical algorithms. (Creating)

Implement the following task constructing algorithms in C language.

Area of a Polygon

Triangulating a polygon

Convex Hull in two dimensions

Convex Hull in three dimensions

Delaunay triangulation

Segment/ray-segment intersection

Segment/ray-triangle intersection

Point in polygon

Point in polyhedron

Intersecting convex polygons

Minkowski convolution with a convex polygon

Multilink robot arm reachability

Suggested Readings

Computational Geometry in C, Joseph O'Rourke, Cambridge University Press

<http://www.science.smith.edu/~jorourke/books/ftp.html>

CSAS6101: ADVANCED OPERATING SYSTEMS LAB

(credits)

Course Outcomes

Demonstrate the understanding on shell designing and scripting (Understanding)

Build and experiment with distributed operating systems algorithms (Applying)

Recall the basic concepts of distributed mutual exclusions (Remembering)

Experiment with the applications of distributed scheduling algorithms (Applying)

Construct a multithreaded program to understand the implementation issues of multiprocessor system.(Creating)

Design a program to classify and compare the security threats relating to virus (Understanding)

List of Experiments

Design and develop a shell that supports atleast 10 commands.

Design and develop a program to implement Lamport's algorithm.

Use ECOS operating system to develop a program for controlling accessing to a pool of resources using mutexes and condition variables.

Develop a program for a forward scheduling for unequal distribution.

Design a multi-class multithreaded program which simulates multiple sleeping barbers, wherein all in one barbershop having a finite number of chairs in the waiting room. Each customer is instantiated from a single customer class & each barber is instantiated from a single barber class.

Develop a program to identify the virus classification, such as boot sector infector, file infector and macro virus.

Suggested Readings

Milan Milenkovic, Operating Systems Concepts and Design, TMH.

M. Singhal and N.G. Shivaratri, Advanced Concepts in Operating Systems, TMH.

A. Silberschatz, P.B. Galvin and G. Gagne, Operating System Concepts, John Wiley and Sons.

CO6				H

CSSN6102: SPEECH AND NATURAL LANGUAGE PROCESSING LAB (Credits)

Module I (4 Hours)

Natural Language Toolkit (NLTK): Installation and getting started; Accessing text corpora; Ngrams; Conditional Frequency Distribution; Regular expressions for detecting word patterns; Regular expressions for tokenizing text

Module II (3 Hours)

Using a tagger; Tagged corpora; Automatic tagging, Ngram tagging;

Module III (4 Hours)

Classify text; supervised classification; Naive Bayes classifiers; Information extraction; Chunking; Named entity recognition; Relation extraction

Module IV (4 Hours)

Parsing with context free grammars; Dependency grammar; Grammar development; Grammatical features; Processing feature structures; Natural language understanding; Propositional logic; First order logic

Suggested Readings

Steven Bird, Ewan Klein, Edward Loper, Natural Language Processing with Python, O'Reilly Media.

Jacob Perkins, Python Text Processing with NLTK 2.0 Cookbook, O'Reilly Media.

CSMP6103: PROJECT II (6 credits)

Course Outcomes

Recall the software development life cycle and fundamental phases of system/application/software design and research. (Remembering)

Explain how to carry out a project work and explain the importance of different phase of a system design, workflow and time estimation with research outlook. (Understanding)

Implement a system and plan how to perform research for real time application. (Applying)

Compare the feasibility of a project in terms of time, effort and money. (Analyze)

Evaluate a project based on its efficiency applicability robustness, user friendliness etc., with socio economic factors (Evaluating)

Design applications by examining and scientifically designing each phase of the project.(Creating)

CSNT0162: COMPUTER NETWORKS (Theory - 3 Credits)

Course Outcomes

1. Describe various technologies used for data communication (Understanding)
2. Identify possible errors in data transfer and solutions for them (Applying)
3. Describe the various protocols used in data communication (Remembering)
4. Classify the routing protocols and analyze how to assign the IP addresses for the given network (Applying)
5. Identify security issues in networks and available protection mechanisms (Applying)

Module 1 (10 hours)

Introduction to Computer networks, Topology of networks, Protocol Stack, OSI and TCP/IP models, Switching – Circuit Switching, Packet Switching and Message Switching.

Module 2 (12 hours)

Data link layer, Types of errors, Error detection and correction, Hamming distance, Cyclic Redundancy Check(CRC), checksum, Hamming code, Multiple Access, Random Access, ALOHA, pure ALOHA and slotted ALOHA, CSMA/CD and SCMA/CA, Polling, Wired LANs, Ethernet - IEEE standards.

Module 3 (14 hours)

Network layer, Networking and Internetworking devices - Repeaters, Bridges, Routers, Gateways, Logical addressing, Network Address Translation(NAT), Internet protocols, Address Mapping, Error reporting and multicasting - Delivery, Forwarding and Routing algorithms, Distance Vector Routing, Link State Routing.

Module 4 (12 hours)

Transport layer, Process-to-process Delivery: UDP, TCP and SCTP, Congestion control and Quality of Service, Application Layer, Domain Name Systems-Remote Login-Email FTP, WWW, HTTP, Introductory concepts on Network management: SNMP.

Module 5 (12 hours)

Cryptography and Network Security: Introduction, Types of attacks, confidentiality and integrity, various terminologies in cryptography, Basics of Symmetric Key Ciphers, block cipher and stream cipher, Basics of Asymmetric Key Ciphers – RSA Cryptosystem. Message Digest: Hash Function, Digital Signature.

Suggested Readings

1. Data Communications and Networking, 4th Edition, Behrouz A Forouzan, 2007
2. Computer Networks, 4th Edition, Andrew S Tannenbaum, 2003, PHI.

CO5					H

CSCB0165: CYBER LAW AND ETHICS
(3 CREDITS – 45 HOURS)
Course Outcomes

1. Identify knowledge related to the constitution and its legal issues in cyberspace. (Remembering)
2. Explain the different cybercrimes, and the related cyber laws. (Understanding)
3. Demonstrate the different perspectives of professional ethics and responsibilities of engineers. (Understand)
4. Illustrate the concepts behind Cyber Torts, Intellectual Property Rights. (Understanding)
5. Describe the concepts in connection to dispute resolution in cyberspace. (Understanding)

Module 1 (10 HOURS)

Constitutional & Human Rights Issues in Cyberspace Freedom of Speech and Expression in Cyberspace, Right to Access Cyberspace – Access to Internet, Right to Privacy, Right to Data Protection, Cyber Crimes & Legal Framework Cyber Crimes against Individuals, Institution and State, Hacking, Digital Forgery, Cyber Stalking/Harassment, Cyber Pornography, Identity Theft & Fraud Cyber terrorism, Cyber Defamation.

Module 2 (15 HOURS)

Internet and Need for Cyber Laws, Modes of Regulation of Internet, Types of cyber terror capability, Net neutrality, Types of Cyber Crimes, India and cyber law, Cyber Crimes and the information Technology Act 2000, Internet Censorship. Cybercrimes and enforcement agencies, Scope & Aims of Engineering & Professional Ethics - Business Ethics, Corporate Ethics, Personal Ethics. Engineering and Professionalism, Positive and Negative Faces of Engineering Ethics, Code of Ethics as defined in the website of Institution of Engineers (India): Profession, Professionalism, and Professional Responsibility. Clash of Ethics, Conflicts of Interest. Responsibilities in Engineering Responsibilities in Engineering and Engineering Standards, the impediments to Responsibility. Trust and Reliability in Engineering

Module 3 (10 HOURS)

Cyber Torts Cyber Defamation, Different Types of Civil Wrongs under the IT Act 2000, Intellectual Property Issues in Cyber Space Interface with Copyright Law, Interface with Patent Law, Trademarks & Domain Names Related issues.

Module 4 (10 HOURS)

Dispute Resolution in Cyberspace, Concept of Jurisdiction, Indian Context of Jurisdiction, and IT Act,

2000. International Law and Jurisdictional Issues in Cyberspace, Dispute Resolutions.

Suggested Readings

1. Engineering Ethics M. Govindarajan, S. Natarajan, V. S. Senthilkumar Prentice –Hall, 2004
2. Constitution of India, Professional Ethics and Human Rights Shubham Singles, Charles E. Haries, and et al Cengage Learning India 2018
3. Justice Yatindra Singh, Cyber Laws, Universal Law Publishing Co, New Delhi.
4. Verma S, K, Mittal Raman, Legal Dimensions of Cyber Space, Indian Law Institute.
5. Jonthan Rosenoer, Cyber Law, Springer, New York. 6. Sudhir Naib, The Information Technology Act, 2005: A Handbook, OUP, New York.

CSQC0156: QUANTUM COMPUTING (3 credits – 45 hours)

Course Outcomes

1. Explain the working of a Quantum Computing program, its architecture and program model.
2. Develop the mathematical foundation for Quantum Computing.
3. Understand the architecture of a Quantum Computing platform.
4. Program quantum algorithm on major toolkits.

Module 1 (6 hours) Introduction to Quantum Computing - Motivation for studying Quantum Computing, Major players in the industry (IBM, Microsoft, Rigetti, D-Wave etc.), Origin of Quantum Computing, Overview of major concepts in Quantum Computing - Qubits and multi-qubits states, Bra-ket notation, Bloch Sphere representation, Quantum Superposition, Quantum Entanglement

Module 2 (9 hours) Mathematical Foundation for Quantum Computing, Matrix Algebra - basis vectors and orthogonality, inner product and Hilbert spaces, matrices and tensors, unitary operators and projectors, Dirac notation, Eigen values and Eigen vectors.

Module 3 (10 hours) Building Blocks for Quantum Program, Architecture of a Quantum Computing platform, Details of q-bit system of information representation - Bloch Sphere, Multi-qubits States, Quantum superposition of qubits (valid and invalid superposition), Quantum Entanglement, Useful states from quantum algorithmic perspective e.g. Bell State, Operation on qubits: Measuring and transforming using gates, Quantum Logic gates and Circuit: Pauli, Hadamard, phase shift, controlled gates, Ising, Deutsch, swap etc. Programming model for a Quantum Computing Program - Steps performed on classical computer, Steps performed on Quantum Computer, Moving data between bits and qubits.

Module 4 (20 hours) Quantum Algorithms, Basic techniques exploited by quantum algorithms - Amplitude amplification, Quantum Fourier Transform, Phase Kick-back, Quantum Phase estimation, Quantum Walks. Major Algorithms, Shor's Algorithm, Grover's Algorithm, Deutsch's Algorithm, Deutsch-Jozsa Algorithm. OSS Toolkits for implementing Quantum program, IBM quantum experience, Microsoft Q, Rigetti PyQuil (QPU/QVM)

Suggested Readings

1. Michael A. Nielsen, "Quantum Computation and Quantum Information", Cambridge University Press.
2. David McMahon, "Quantum Computing Explained", Wiley

Mapping of COs to Syllabus

Course Out-come	Module 1	Module 2	Module 3	Module 4

CSAD0157: AD HOC AND SENSOR NETWORKS
(3 credits – 45 hours)
Course Outcomes

1. Recall and understand the concept design issues in ad hoc and sensor networks (Remembering)
2. Understand the different types of MAC protocols.(Understanding)
3. Apply the concept of routing protocol in Adhoc network (Applying)
4. Analyse the TCP issues in Adhoc networks. (Analysing)
5. Formulate the architecture and protocols of wireless sensor networks. (Evaluating)

Module 1 (9 hours) Fundamentals of Wireless Communication Technology – The Electromagnetic Spectrum – Radio propagation Mechanisms – Characteristics of the Wireless Channel -mobile ad hoc networks (MANETs) and wireless sensor networks (WSNs) : architectures, Applications of Ad Hoc and Sensor networks. Design Challenges in Ad hoc network

Module 2 (9 hours) Issues in designing a MAC Protocol- Classification of MAC Protocols- Contention based protocols-Contention based protocols with Reservation Mechanisms- Contention based protocols with Scheduling Mechanisms – Multi channel MAC-IEEE 802.11

Module 3 (9 hours) Issues in designing a routing and Transport Layer protocol for Ad hoc networks- proactive routing, reactive routing (ondemand), hybrid routing- Classification of Transport Layer solutions-TCP over Ad hoc wireless Networks.

Module 4 (9 hours) Single node architecture: hardware and software components of a sensor node – WSN Network architecture: typical network architectures-data relaying and aggregation strategies -MAC layer protocols: self-organizing, Hybrid TDMA/FDMA and CSMA based MAC- IEEE 802.15.4.

Module 5 (9 hours) Issues in WSN routing – OLSR- Localization – Indoor and Sensor Network Localization-absolute and relative localization, triangulation-QOS in WSN-Energy Efficient Design-Synchronization-Transport Layer issues.

Suggested Readings

CSNN0158: NEURAL NETWORKS AND DEEP LEARNING (3 credits – 45 hours)

Course Outcomes

1. Summarize the role of Deep learning in Machine Learning Applications.(Understanding)
2. To design and implement Deep Learning Applications. (Creating)
3. Critically Analyse Different Deep Learning Models in Image Related Projects. (Analysing)
4. To design and implement Convolutional Neural Networks. (Applying)
5. Apply Deep Learning in NLP and Image Processing.(Applying)

Module I (12 hours) INTRODUCTION TO ANN Features, structure and working Computing Comparison of BNN and ANN, Backpropagation networks: (BPN)Architecture of feed forward network, single layer ANN, multilayer perceptron, back propagation learning, input - hidden and output layer computation, backpropagation algorithm, applications, selection of tuning parameters in BPN, Numbers of hidden nodes, learning. Basics of Artificial Neural Networks -History of neural network research, characteristics of neural networks terminology, models of neuron Mc Culloch – Pitts model, Perceptron, Adaline model, Basic learning laws, Topology of neural network architecture.

Module II (9 hours) TRAINING NEURAL NETWORK Risk minimization, loss function, backpropagation, regularization, model selection, and optimization. Conditional Random Fields: Linear chain, partition function, Markov network, Belief propagation, Training CRFs, Hidden Markov Model, Entropy.

Module III (15 hours) INTRODUCTION TO DEEP LEARNING ARCHITECTURES Feed Forward Neural Networks, Gradient Descent, Back Propagation Algorithm, Vanishing Gradient problem, Mitigation, ReLU Heuristics for Avoiding Bad Local Minima, Heuristics for Faster Training, Nestors Accelerated Gradient Descent, Regularization, Dropout. CNN Architectures, Convolution, Pooling Layers, Transfer Learning, Image Classification using Transfer Learning LSTM, GRU, Encoder/Decoder Architectures, Autoencoders, Standard-Sparse, Denoising, Contractive, Variational Autoencoders, Adversarial Generative Networks Autoencoder and DBM.

Module IV (9 hours) APPLICATIONS OF NEURAL NETWORKS DEEP LEARNING Image Segmentation, Object Detection, Automatic Image Captioning, Image generation with Generative Adversarial Networks, Video to Text with LSTM Models, Attention Models for Computer Vision, Case Study: Named Entity Recognition, Opinion Mining using Recurrent Neural Networks, Parsing and Sentiment Analysis using Recursive Neural Networks, Sentence Classification using Convolutional Neural Networks, Dialogue Generation with LSTMs.

Suggested Readings

CSBF0159: BLOCKCHAIN FUNDAMENTALS**(3 credits – 45 hours)****Course Outcome**

1. The student will be able to identify the history, technology, and applications of Blockchain (Remembering)
2. The student will be able to explain Blockchain applications (Understanding)
3. The student will be able to demonstrate Blockchain concepts clearly and persuasively (Applying)
4. The student will be able to assess crypto currency exchanges and wallets safely (Evaluate)
5. The student will be able to create Crypto token (Create)

Module I (8 hours) Distributed systems, Byzantine Generals problem, Consensus, History of Blockchain Technology, Cryptographic Hashes, Digital Signatures, Peer to Peer Networks

Module II (12 hours) Introduction to Blockchain, Generic elements of a Blockchain, Features of a Blockchain, Applications of Blockchain technology, Tiers of Blockchain technology, Types of Blockchain, Hash-based Ledgers, Hash Validation - Proof Of work, Proof of stake, UTXO Model, Wallets and Private Keys, Ask-the-Expert session

Module III (10 hours) Consensus in Blockchain, CAP theorem and Blockchain, Structure of a Block: Header, Merkle trees, Benefits and limitations of Blockchain, Smart Contracts, Types of Blockchains

Module IV (10 hours) Platforms to implement Blockchain: Ethereum – Ether, Gas, Solidity, Multichain - permission, asset, streams, Hyperledger – Architecture, Framework (Fabric, Sawtooth Lake)

Module V (5 hours) Design Thinking, Business Awareness, Customer Handling, Case studies: Smart contract for crowd funding, Stock market transactions.

Suggested Readings:

1. Arvind Narayanan, Joseph Bonneau, Edward Felten, Andrew Miller and Steven Goldfeder, Bitcoin and Cryptocurrency Technologies: A Comprehensive Introduction, Princeton University Press (July 19, 2016).
2. Wattenhofer, The Science of the Blockchain
3. Antonopoulos, Mastering Bitcoin: Unlocking Digital Cryptocurrencies
4. Satoshi Nakamoto, Bitcoin: A Peer-to-Peer Electronic Cash System
5. DR. Gavin Wood, "ETHEREUM: A Secure Decentralized Transaction Ledger," Yellow paper.2014.
6. Nicola Atzei, Massimo Bartoletti, and Tiziana Cimoli, A survey of attacks on Ethereum smart contracts

CSCM0160: CLOUD COMPUTING**(3 credits – 45 hours)****Course Outcomes**

1. Define the various evolutionary steps of computation. (Remembering)
2. Illustrate security issues associated with cloud computation. (Understanding)

3. Apply the use of a virtual private cloud in Amazon web service and Experiment with the management console for virtualization using hypervisors. (Applying)
4. Develop an application using map reduce program and create an application and deploy on real time cloud platform like IBM Bluemix. (Creating)
5. Analyze the concepts of big data and Hadoop components. (Analysing)
6. Develop and assess a real time application deployed on cloud platform. (Creating/Evaluating)

Module 1(10 hours) Introduction to Cloud Computing, the Evolution of Cloud Computing, Hardware Evolution, Internet Software Evolution, Server Virtualization, Web Services Deliver from the Cloud, Communication-as-a-Service, Infrastructure-as-a-Service, Monitoring-as-aService, Platform-as-a-Service, Software-as-a-Service, Building Cloud Network

Module 2 (13 hours) Datan the cloud: Relational databases, Cloud file systems: GFS and HDFS, Big Table, HBase and Dynamo. Map-Reduce and extensions: Parallel computing, The map-Reduce model, Parallel efficiency of Map-Reduce, Relational operations using MapReduce, Enterprise batch processing using Map-Reduce, Introduction to cloud development, Example/Application of Mapreduce.

Module 3 (14 hours) Putting Security on the Spot with Questions: Understanding Security Risks, Reducing Cloud Security Breaches, Implementing Identity Management, Benefits of identity management, Aspects of identity management, Playing Detective: Detection and Forensics, Activity logs, HIPS and NIPS, Data audit, Encrypting Data, Creating a Cloud Security Strategy

Module 4 (8 hours) Virtualization and the Cloud: Visualizing Virtualization, Characteristics, Using a hyper visor in virtualization, Abstracting hardware assets, Managing Virtualization, Foundational issues, Abstraction layer, Provisioning software, Virtualizing storage, Hardware provisioning, Security issues, Taking Virtualization into the Cloud.

Suggested Readings

1. Cloud Computing for Dummies by Judith Hurwitz, R. Bloor, M. Kaufman, F. Halper, (Wiley India Edition)
2. Enterprise Cloud Computing by Gautam Shroff, Cambridge.
3. Cloud Security by Ronald Krutz and Russell Dean Vines, Wiley-India
4. Google Apps by Scott Granneman, Pearson
5. Cloud Security and Privacy by Tim Malhar, S. Kumaraswamy, S. Latif (SPD,O'REILLY)
6. Cloud Computing: A Practical Approach, Anthony T Velte, et.al McGraw Hill
7. Cloud Computing Bible by Barrie Sosinsky, Wiley India

CSMP6104: MAJOR PROJECT - PHASE II (3 credits)

Course Outcomes

1. Define and choose the Software Development Life Cycle and fundamental phases of system / application / software design and research. (Remembering)
2. Demonstrate how to carry out a project work and understand the importance of different phases of a system design, workflow and time estimation with research outlook. (Understanding)
3. Construct a system and identify how to perform research for real time application. (Applying)
4. Analyze the feasibility of a project in terms of time, effort and money. (Analysing)

5. Evaluate a project based on its efficiency, applicability, robustness, user friendliness etc., with socio-economic impact. (Evaluating)
6. Design applications by examining and scientifically designing each phase of a project work. (Creating)

**PYTK0103: ESSENCE OF INDIAN TRADITIONAL KNOWLEDGE
(2 Credits)**

Description of the Course This paper is an introduction to some of the basic concepts, themes and questions in traditional Indian insights. We shall begin with a brief darshan and the *jijñāsā* ('desire to know') of the *ṛṣi* ('Sage') on the dominant concepts, themes and queries that developed into a system of thinking. This shall be followed by a discourse on the principal themes and concepts, which emerged as the basis of belief systems and ethics of life. And, finally we shall reflect on the ethics and goals of life with its present-day challenges, and see if the wisdom of the past – Indian darshan could offer a way forward for philosophising the essence of life.

Objective:

The objective of this course is two-fold.

1. To gain insight of and appreciate the richness of ancient Indian philosophical traditions
2. To inculcate *jijñāsā* (desire to know) and develop the art of philosophising with the essence of Indian tradition.

Course Outcome: On completion of this course the students shall be able to:

1. name the Indian schools of thought and relate the concepts associated with the schools. (Knowledge/Memory)
2. differentiate the schools of thoughts and explain the characteristic of the schools. (Comprehension/Understanding)
3. identify and locate the school of thought and concepts in contemporary thinking. (Application/Usage)
4. compare and analyse the schools of thought with the current day thinking (Analysis/Enquiry)
5. generalise and summarise the influence of concepts and schools of thought in our present day thinking. (Synthesis/amalgamation)
6. assess and determine the importance philosophising and thinking in human life. (Evaluation/Appraisal)

UNIT I: Introduction (4 HOURS)

1. Introduction to Indian thinking
2. The Vedas and Upanisads: Ritual to critique of ritual and the doctrine of the self

UNIT II: Astika Schools (10 HOURS)

1. Sāṃkhya: Prakṛti and Puruṣa, Theory of Evolution
2. Yoga – Body, Mind and Self
3. Nyāya-Vaiśeṣika - Nature of Knowledge
4. Mīmāṃsā - Vedānta – Knowledge and Knowledge of Reality

UNIT III: Nastika Schools (6 HOURS)

1. Cārvāka: Metaphysics and Epistemology
2. Early Buddhism: Four Noble Truths (Arya Satyas) and Doctrine of Dependent Origination (Pratītyasamutpāda)
3. Jainism: Anekāntavāda and Syādvāda (Theory of relativity)

UNIT IV: INDIAN ETHICS (10 HOURS)

1. Bhagavad-Gita: Niṣkāmakarma
2. Ashrama: Brahmacharya, Grihastha, Vanaprastha and Sannyasa
3. Puruṣārthas: Dharma, Artha, Kāma, and Mokṣa
4. Conception of Satya and Ahimsā
5. Environmental Ethics and Sustainability

Suggested Readings:

1. Chakravarty, N. (1992), Indian Philosophy: The Path Finder's and System Builders. New Delhi: Allied Publishers.
2. Chatterjee, S.C. & Datta, D.M. (1984). An Introduction to Indian Philosophy, (reprint). Calcutta: University of Calcutta.
3. Dasgupta, S.N. (2004). A History of Indian Philosophy (vol.1). Delhi: Motilal Banarasidass Publishers, Pvt. Ltd.
4. Hiriyana, M. (1951). Outlines of Indian Philosophy. London: Allen & Unwin.
5. Radhakrishnan, S. (2008) Indian Philosophy (Vol. 1 & Vol. 2). 2nd Edition. Oxford University Press.
6. Narayan, R. and Kumar, J. (2003) Ecology and Religion: Ecological Concepts in Hinduism, Buddhism, Jainism, Islam, Christianity and Sikhism, Deep and Deep Publications: New Delhi.
7. Singh, V. (2012). The Human Footprint on Environment: Issues in India. Macmillan India: New Delhi. 2012

CSM1227T: ORGANISATIONAL BEHAVIOUR (3 credits – 30 hours)

(L-T-P:3-0-0)

Objective: This course is designed to give students the basic knowledge of human behavior needed to provide a more effective organizational environment. The basic elements of the course will be the behavior of individuals in organizations, group behavior in organizations, and how these behaviors affect the overall performance of organizations. Particular emphasis is placed on individual difference, attitude, motivation, job satisfaction, communication, leadership, stress, change, and organizational culture.

Module I (5 hours)

The Study of Organizational Behaviour (OB): Learning objectives, Definition and Meaning, Why Study OB, Models in OB, New Challenges for OB Manager. Learning – Nature of Learning, How Learning occurs, Learning and OB. Case Analysis

Module II (7 hours)

Foundations of Individual Behaviour: Personality – Meaning and Definition, Determinants of Personality, Personality Traits, Personality and OB. Perception – Meaning and Definition, Perceptual Process, Importance of Perception in OB. Motivation– Nature and Importance, Herzberg's Two Factor Theory, Maslow's Need Hierarchy Theory, Alderfer's ERG Theory, Evaluations. Case Analysis

Module III (10 hours)

Organizational Behaviour Process: Communication – Importance, Types, Gateways and Barriers to Communication, Communication as a tool for improving Interpersonal Effectiveness. Groups in Organizations - Nature, Types, Why do people join groups, Group Cohesiveness and Group Decision making Managerial Implications, Effective Team Building.

Leadership – Leadership and Management, Theories of Leadership – Trait theory, Leader Behaviour theory, Contingency Theory, Leadership and Followership, How to be an effective Leader. Conflict – Nature of Conflict and Conflict Resolution. An Introduction to Transactional Analysis (TA). Case Analysis

Module IV (8 hours)

Organization: Organizational Culture – Meaning and Definition, Culture and Organizational Effectiveness. Introduction to Human Resource Management – Selection, Orientation, Training and Development, Performance Appraisal, Incentives; Organizational Change – Importance of Change, Planned Change and OB techniques. International Organizational Behaviour – Trends in International Business, Cultural Differences and Similarities, Individual and Interpersonal Behaviour in Global Perspective. Case Analysis

COURSE/LEARNING OUTCOMES

At the end of the course students will be able to:

- CO1: Define the meaning of organization behavior (Knowledge)
- CO2: Explain the models and the theory of learning and the foundations of individual behavior. (Comprehension)
- CO3: Establish the relationship between the various theories of motivation and workplace behavior. (Application)
- CO4: Differentiate between leadership and management and the different leadership theories. (Analysis)
- CO5: Formulate different types of leadership strategies. (Synthesis)
- CO6: Evaluate the various human resource management functions. (Evaluation)

Suggested Readings

VSP Rao, Organizational Behaviour, Excel Books.
Stephen P Robbins, Organizational Behaviour, PHI Learning, New Delhi
JW Newstorm and K. Davis, Organizational Behaviour: Human Behaviour at Work, MGH, New Delhi
K. Aswathappa, Organizational Behaviour, Himalaya Publishing House, New Delhi
PN Khandawalla, Organizational Behaviour, McGraw Hill, New Delhi.

CSES228T: ENVIRONMENTAL SCIENCE (0-0-0)

Course Outcomes:

Name different types of natural resources; state the concept of an ecosystem, recall the types of biodiversity and ways of conserving biodiversity, causes, effects and control measures of pollution, social issues and its effect on the environment. (Remembering)
Explain what they understand by an ecosystem, biodiversity, explain how environmental pollution occurs and steps that can be taken to control pollution. (Understanding)
Value the overall benefit to the environment of preserving natural resources, preserving ecosystems and conserving biodiversity. Learn about sustainable development to protect the environment and promote human health. (Evaluating)
Develop ideas of how to preserve the environment by connecting the ideas of minimizing pollution, regulating human population growth, conserving biodiversity by preserving ecosystems and judicious use of natural resources. (Creating)

Module 1: The Multidisciplinary Nature of Environmental Studies (3 lectures)

Definition, scope and importance, need for public awareness.

Module 2: Natural Resources (3 lectures)

Different types of natural resources and associated problems - forest resources, water resources, mineral resources, food resources, energy resources, land resources.
Conservation of natural resources.

Module 3: Ecosystems (4 lectures)

Concept of an ecosystem, structure and function of an ecosystem, producers, consumers and decomposers, energy flow in the ecosystem, food chains, food webs.
Structure of following ecosystems - forest ecosystem, grassland ecosystem, desert ecosystem, aquatic ecosystems.

Module 4: Biodiversity and Its Conservation (4 lectures)

Types of biodiversity – genetic, species and ecosystem, value of biodiversity, global biodiversity, India as a mega-diversity nation, threats to biodiversity, conservation of biodiversity - in-situ and ex-situ conservation.

Module 5: Environmental Pollution (6 lectures)

Definition, causes, effects and control measures of - air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, nuclear hazards and e-pollution, Solid waste management, Disaster management

Module 6: Social Issues and the Environment (6 lectures)

From unsustainable to sustainable development, urban problems related to energy, water conservation, rain water harvesting, climate change, global warming, acid rain, ozone layer depletion.

Environment protection act.

Introduction to environmental impact assessment.

Module 7: Human Population and the Environment (4 lectures)

Population growth and sex ratio; Population explosion - family welfare programme; Environment and human health; HIV/AIDS; Role of information technology in environment and human health.

Suggested Readings

Textbook of Environmental Studies, Erach Bharucha; UGC, New Delhi

Environmental Studies, University, J.P. Sharma; Science Press

Real World Cases in Green Chemistry, Cann, M.C. & Connelly, M.E., ACS, 2000

Understanding our Environment: An Introduction to Environmental Chemistry and Pollution, Roy, M. Harrison; R.S.C.

CSAP224T: Advanced Programming**Course Outcome**

(Essential) Use medium-level programming constructs effectively (objects, data abstraction, recursion, etc.)

(Essential) Design and implement software using modular, object-oriented techniques

(Essential) Work with data structures within programs (arrays, lists, trees) in this course's context.

(Desired/Advanced) Understand more advanced programming paradigms (e.g., concurrency or generic programming) if the institute includes them.

Syllabus Modules and Topics**Module 1: Objects and Classes**

Object-oriented programming fundamentals

Classes, objects, encapsulation

Constructors, destructors

Static members, access control

Module 2: Inheritance and Polymorphism

Types of inheritance

Method overriding

Polymorphism (compile-time and run-time)

Abstract classes and interfaces

Module 3: Exception Handling

Errors and exceptions

Try-catch-finally blocks

Custom exceptions

Best practices in exception handling

Module 4: Generic Programming

Templates (in C++ / generics in Java)
Generic classes and functions / methods

Module 5: Recursion and Advanced Data Structures

Recursive functions: definition and usage
Data structures: linked lists, stacks, trees (especially binary trees)
Implementation using OOP principles

Module 6: File Handling / I/O

Streams, file I/O
Text and binary file operations
Serialization (if included as advanced)

Module 7: (Optional / Advanced) Concurrency / Threads

Thread creation, synchronization
Issues: deadlock, race condition
Thread-safe programming (if institute has capacity)

Recommended Textbooks / References

Concepts, Techniques, and Models of Computer Programming by Peter Van Roy & Seif Haridi.

Standard OOP texts (depending on language used) — e.g., Java or C++ programming books.

DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING**NEP Batch Syllabus (1st Sem to 4th Sem)****DETAILED SYLLABUS THEORY COURSES****EEEL100T: BASIC ELECTRICAL ENGINEERING**

(3 Credits – 45 hours) (L-T-P: 2-1-0)

(For BTech CVE and MNE) Objectives:

To understand and analyse basic electric and magnetic circuits.

To study the working principles of electrical machines and power converters.

To introduce the components of low voltage electrical installations.

COURSE OUTCOMES

Define basic terminologies related to electrical circuits and machines. (Remembering)

Explain the working principle, construction, applications of dc machines and ac machines. (Understanding)

Explain basics of converters, domestic wiring and Electrical Installations. (Understanding)

Implement network theorems to simplify and solve a complex circuit. (Applying)

Module 1: DC Circuits (10 lectures)

Electrical circuit elements (R, L and C), voltage and current sources, Kirchhoff current and voltage laws, analysis of simple circuits with dc excitation. Superposition, Thevenin and Norton Theorems. Time-domain analysis of first-order RL and RC circuits.

Module 2: AC Circuits (15 lectures)

Representation of sinusoidal waveforms, peak and rms values, phasor representation, real power, reactive power, apparent power, power factor. Analysis of single-phase ac circuits consisting of R, L, C, R-L, R-C, R-L-C combinations (series and parallel), resonance. Three phase balanced circuits, voltage and current relations in star and delta connections.

Module 3: Electrical Machines (10 lectures)

DC Machines: Principle of operation of generators and motors, construction of DC machine, EMF and Torque Equations, Classification and applications of DC machines.

Transformer: Construction and principle of operation of a single-phase transformer, EMF equation, introduction of autotransformer.

Induction Motor: Classification and applications, Construction and principle of operation of single phase and three-phase induction motor

Module 4: Power Converters (5 lectures)

DC-DC buck and boost converters, duty ratio control. Single-phase and three-phase voltage source inverters; sinusoidal modulation.

Module 5: Electrical Installations (5 lectures)

Components of LT Switchgear: Switch Fuse Unit (SFU), MCB, ELCB, MCCB, Types of Wires and Cables, Earthing. Types of Batteries, Important Characteristics for Batteries. Elementary calculations for energy consumption, power factor improvement and battery backup.

Suggested Readings

EEEL102T: BASIC ELECTRICAL ENGINEERING

(4 Credits – 60 hours) (L-T-P: 3-1-0) (For BTech CSE, EEE and ECE)

Objectives:

To understand and Analyse basic electric and magnetic circuits.

To study the working principles of electrical machines and power converters.

To introduce the components of low voltage electrical installations.

COURSE OUTCOMES

Describe the construction, operation, and performance characteristics of electrical machines including transformers, DC machines, and three-phase induction motors. (Remembering)

Explain the principles of electromagnetic induction and apply concepts such as self and mutual inductance in magnetic and electrical systems. (Understanding)

Identify and compare various conventional and renewable sources of electrical power generation and explain their role in modern energy systems. (Applying)

Analyze DC and AC electrical circuits using fundamental laws and apply phasor techniques to determine voltage, current, power, and energy. (Analyzing)

Module I: D. C. Circuits covering, Ohm's Law and Kirchhoff's Laws (8 hours)

Analysis of series, parallel and series-parallel circuits excited by independent voltage sources; Power and energy; Electromagnetism covering, Faradays Laws, Lenz's Law, Fleming's Rules, Statically and dynamically induced EMF; Concepts of self-inductance, mutual inductance and coefficient of coupling; Energy stored in magnetic fields;

Module II: Single Phase and Three Phase A.C. Circuits (12 hours)

Single Phase A.C. Circuits covering, Generation of sinusoidal voltage- definition of average value, root mean square value, form factor and peak factor of sinusoidal voltage and current and phasor representation of alternating quantities; Analysis with phasor diagrams of R, L, C, RL, RC and RLC circuits; Real power, reactive power, apparent power and power factor, series, parallel and series- parallel circuits; Three Phase A.C. Circuits covering, Necessity and Advantages of three phase systems, Generation of three phase power, definition of Phase sequence, balanced supply and balanced load; Relationship between line and phase values of balanced star and delta connections; Power in balanced three phase circuits, measurement of power by two wattmeter method; Effect of Damper, Flux Linkage Variation and AVR.

Module III: Transformer (6 hours)

Transformers covering, Principle of operation and construction of single phase transformers (core and shell types). EMF equation, losses, efficiency and voltage regulation; Synchronous Generators covering, Principle of operation; Types and constructional features; EMF equation.

Module IV: DC Machines (8 hours)

DC Machines covering, working principle of DC machine as a generator and a motor; Types and constructional features; EMF equation of generator, relation between EMF induced and terminal voltage enumerating the brush drop and drop due to armature reaction; DC motor working principle; Back EMF and its significance, torque equation; Types of D.C. motors, characteristics and applications; Necessity of a starter for DC motor;

Module V: Three Phase Motors (6 hours)

Module V: Three Phase Induction Motors covering; Concept of rotating magnetic field; Principle of operation, types and constructional features; Slip and its significance; Applications of squirrel cage and slip ring motors; Necessity of a starter, star-delta starter.

Module VI: Sources of Electrical Power (5 hours)

Sources of Electrical Power covering, Introduction to Wind, Solar, Fuel cell, Tidal, Geo-thermal, Hydroelectric, Thermal-steam, diesel, gas, nuclear power plants; Concept of cogeneration, and distributed generation;

EEAE205T: ANALOG ELECTRONICS

(4 Credits - 60 hours) (L-T-P: 3-1-0)

Course Outcomes

Recall the operating principles and structural characteristics of diodes, BJTs, and MOSFETs, and their role in analog electronic circuits. (Remembering)

Explain amplifier configurations (CE/CS, CB/CG, CC/CD) and interpret small and high-frequency performance using low- and high-frequency models. (Understanding)

Design biasing circuits and single-stage amplifiers to meet given specifications, using small-signal models for performance estimation. (Applying)

Analyze multi-stage amplifier circuits, feedback configurations, and oscillators to evaluate parameters like gain, bandwidth, stability, and CMRR. (Analyzing)

Objective

To provide students with a solid foundation in analog electronic circuits through an in-depth study of semiconductor devices, amplifier configurations, frequency response, and feedback systems, while emphasizing analysis, design, and implementation skills relevant to real-world applications.

Module I: Semiconductor devices (12 hours)

Diode, BJT, MOSFET, their structures, principle of operations, electrical characteristics and their low frequency models, Amplifier models: Voltage amplifier, current amplifier, trans-conductance amplifier and trans-resistance amplifier

Module II: Biasing schemes & Small signal analysis (12 hours)

Biasing schemes for BJT and FET amplifiers, bias stability, various configurations (such as CE/CS, CB/CG, CC/CD) and their features. Small signal analysis: Estimation of voltage gain, input resistance, output resistance etc. for CE/CS, CB/CG, CC/CD amplifiers, and design procedure for particular specifications.

Module III: High frequency analysis: (6 hours)

High frequency analysis: Miller's theorem, high frequency transistor models, frequency response of single stage amplifier (CE/CS, CB/CG, CC/CD amplifiers)

Module IV: Current mirrors (6 hours)

Current mirrors: Basic topology and its variants, V-I characteristics, output resistance and minimum sustainable voltage (V_{ON}), maximum usable load, generation of current source.

Module V: Differential amplifier, Feedback and Stability: (12 hours)

Differential amplifier: Basic structure and principle of operation, calculation of differential gain, common-mode gain, CMRR and ICMR. Different feedback topologies such as voltage series, current series, voltage shunt, current shunt, effect of feedback on gain, bandwidth etc., concept of stability.

Module VI: Operational amplifier and Oscillators (12 hours)

Design of two-stage amplifier, frequency compensation, generalized structure of multistage amplifier. Basic criteria for oscillation, Phase-shift, and Wien Bridge, oscillators, multivibrators (astable, monostable, bistable).

EEIS206T: INFORMATION AND SIGNALS

(4 Credits - 60 Hours) (L:T:P - 3:1:0)

Course Objective

To develop skills for analyzing signals and systems for any given process.

COURSE OUTCOMES

After completing the course, the students will be able to-

CO1: Apply the concepts of real time systems such as notion of stability and causality into the practical field. (Applying)

CO2: Analyze different types of systems and signals using the concepts and tools. (Analyzing)

Module-I (8 hours)

Signals and Systems: signal characterization: discrete and continuous, energy, power, periodicity, finite duration. System characterization: linearity, time invariance, stability, causality, memory, invertibility.

Module-II (10 hours)

Linear Time-Invariant systems: delta functions, unit step functions, impulse response, convolution, impulse response characterization with respect to system properties such as causality.

Module-III (10 hours)

Fourier Series Representation: Eigen-function of the LTI system, Fourier series representation of periodic signals (continuous and discrete), properties of Fourier series: linearity, time shifting, time scaling, conjugation, multiplication, convolution. Parseval's relation.

Module-IV (10 hours)

Fourier Transform: convergence of Fourier transform, representation of aperiodic signals (continuous and discrete) with Fourier transform, representation of periodic signals (continuous and discrete) with Fourier transform, properties of Fourier transforms: linearity, differentiation in time and frequency, convolution, multiplication, time and frequency shifting, Parseval's relation.

Module-V (6 hours)

Sampling: sampling of a continuous signal, aliasing, Nyquist criteria, interpolation of signal from its samples.

Module-VI (8 hours)

Laplace Transform: Notion of complex frequency, Laplace transform, region of convergence, pole-zero (s-plane) plots, properties of Laplace transforms. Unilateral Laplace transform, Initial and Final value theorems, differential equations, system representations: direct, cascade, parallel forms.

Module-VII (8 hours)

Z-Transform: discrete system and notion of complex frequency, z-transform, region of convergence, pole-zero plots (z-plane), Unilateral Laplace transform, Initial and Final value theorems, difference equations, system representations: direct, cascade, parallel forms.

EENA207T: NETWORK ANALYSIS (THEORY)**(4 Credits - 60 hours) (L-T-P: 3-1-0)****Pre-Requisite: Basic Electrical Engineering****Objective**

The objectives of this outcome is to understand the physical laws that governs the response of electrical circuits and networks. The students obtain equations to solve circuits in steady and in transitory state through the application of mathematical tools.

Course Outcomes (COs)

The students are expected to have the ability to

Define and relate the various network theorems used for circuit analysis. (Remembering)

Analyze circuits in the sinusoidal steady-state and two-port circuit behaviour. (Understanding)

Determine the transient and steady-state response of electrical circuits. (Applying)

Evaluate graph of a network, tie-set matrix, loop currents, cut-set matrix and their node-pair potentials. (Analysing)

Module I: Network Theorems (16 lectures)

Superposition theorem, Thevenin theorem, Norton theorem, Maximum power transfer theorem, Reciprocity Theorem, Compensation Theorem, Tellegen's Theorem, Substitution Theorem, Voltage and current divider rule. Analysis with dependent current and voltage sources. Node and Mesh analysis, Source transformation, Concept of Duality and Dual Networks.

Module II: Solution of First and Second order networks (10 lectures)

Solution of first and second order differential equations for series and parallel R-L, R-C, R-L-C circuits, initial and final conditions in network elements, forced and free response, time constants, steady state and transient response.

Module III: Sinusoidal steady state analysis (9 lectures)

Representation of sine function as rotating phasor, phasor diagrams, impedances and admittances, AC circuit analysis, Effective and RMS values, Average power and complex power. Three phase circuits. Mutually coupled circuits, Dot Convention in coupled circuits, Ideal Transformer.

Module IV: Electrical Circuit Analysis Using Laplace Transforms (11 lectures)

Review of Laplace Transforms, Analysis of Electrical Circuits using Laplace Transform for standard inputs, convolution integral, Inverse Laplace transform, transformed network with initial conditions, Transfer function representation. Poles and Zeros. Frequency response(magnitude and phase plots), Series and Parallel Resonances.

Module V: Two Port Network and Network Functions (8 lectures)

Two port networks, terminal pairs, relationship of two-port variables, impedance parameters, admittance parameters, transmission parameters and hybrid parameters, Interconnections of two- port networks.

Module VI: Graph Theory (6 lectures)

Graph of network, concept of tree branch, tree link. Incidence matrix, Tie-set matrix and loop currents, Cut set matrix and node pair potentials.

EEEM210T: ELECTRICAL MACHINES-I**(4 Credits - 60 hours) (L-T-P: 3-1-0)****Pre-requisite: Physics, Basic Electrical Engineering****Objective**

The objective of this course is to equip the students with a basic understanding of different DC & AC machines fundamentals; their different parts and help them to gain the skills for operating these machines. The course also aims to equip students with the ability to understand and analyse the different circuits of DC & AC machines and transformers. The instructor will provide understanding of construction, principle of operation, performance, and control of various electrical machines used in the industry.

Course Outcomes:

The students are expected to have the ability to

Compare the operations of different dc and ac electrical machines. (Understanding)

Apply their knowledge to solve mathematical problems of different electrical machines. (Applying)

Analyze the performance of different electrical machines. (Analyzing)

Select various electric machines for field applications. (Evaluating)

Module I: Magnetic Circuits and Electromechanical Energy Conversion (4 hours)

General introduction to electrical machines: Magnetic circuits, Concepts of reluctance and permeance, Faraday's law of electromagnetic induction, Lenz's Law and Fleming's rules. Principle of operation of generators and motors. Magnetic curves and their relevance.

Module II: Transformers (9 hours)

Constructional features, Principle, and operation of single-phase transformers; Ideal transformer and practical transformer, name plate rating, phasor diagrams, equivalent circuit and determination of its parameters from Open-Circuit and Short-Circuit tests; Per-Unit parameter values and its importance; Voltage Regulation, efficiency and all-day efficiency expressions and calculations. Sumpner's Test (Back-To-Back test or Regenerative test).

3-phase Transformer: As a single unit with name plate rating and as a bank of three single-phase transformers; Vector groups for various connections; Per-phase analysis; Qualitative explanation for origin of harmonic current and voltage and its suppression tertiary winding. Parallel operation conditions and load sharing of transformers.

Autotransformer: Basic constructional features; VA conducted magnetically and electrically. Comparative study with two-winding transformer.

Module III: D.C. Machines (7 hours)

D.C. Machines: Constructional features, armature windings - simple lap and wave winding; armature voltage and torque equations, armature reaction.

D.C. generators: Classifications, performance characteristics; Losses, efficiency and power flow diagram.

D.C. motors: Classifications, torque/speed characteristics of different types; Losses, efficiency and power flow diagram. Starting, speed control and braking. Testing and efficiency.

Module IV: Three-phase Induction machines (8 hours)

Three-phase Induction machines: Constructional features and types; 3-phase distributed winding production of rotating magnetic field. Concept of slip; Phasor diagram and development of equivalent circuit and derivation of torque equation, power flow diagram; Typical torque-slip characteristic and influence of different parameters on it; Methods of starting and speed control; Different types of braking circuit arrangement and qualitative explanation. No-load and blocked-rotor tests.

Module V: Single-Phase AC motors and Universal motors (5 hours)

Single-Phase induction motor: Double revolving field theory and development of equivalent circuit. Methods of starting using auxiliary winding; selection of capacitor value during starting and running.

Universal series motor: constructional features and performance characteristics.

Module VI: Synchronous machines (7 hours)

Synchronous machines: Constructional features and types; Operation of synchronous generators and motors connected to bus and phasor diagrams for normal, under and over excited conditions; Power and torque characteristics and capability curves; Parallel operation; Salient pole synchronous machine - phasor diagram and determination of synchronous reactances; starting and speed control of synchronous motors.

INTRODUCTION TO INDIAN KNOWLEDGE SYSTEMS (2 Credits - 30 Hours) (L:T:P – 2:0:0)

Course Objectives

To introduce fundamentals of Ancient Indian Educations to understand the pattern and purpose of studying vedas, vedangas, upangas, upveda, purana & Itihasa

To help students to trace, identify and develop the ancient knowledge systems.

To help to understand the apparently rational, verifiable and universal solution from ancient Indian knowledge system for the holistic development of physical, mental and spiritual wellbeing

To build in the learners a deep rooted pride in Indian knowledge, committed to universal human right, well-being and sustainable development.

Course Outcomes

After completing the course, the students will be able to-

CO1: Identify the foundational elements of Bhāratīya civilization, including its knowledge systems, educational institutions, and philosophical traditions. (*Understanding*)

CO2: Apply traditional Indian approaches to language, logic, measurement systems, and physical reality to modern interdisciplinary contexts. (*Applying*)

CO3: Analyse the contributions of key scholars and literary figures in the development of Indian arts, sciences, and philosophy. (*Analysing*)

CO4: Evaluate the scientific principles and technological innovations from ancient India in the areas of mathematics, astronomy, medicine, sciences, technology and environmental studies. (*Evaluating*)

Module-I: Foundations of Indian Knowledge Systems and Civilisational Heritage

Bhāratīya Civilization and Development of Knowledge System (4 hours)

Genesis of the land, Antiquity of civilization, On the Trail of the Lost River, Discovery of the Saraswatī River, the Saraswatī-Sindhu Civilization, Traditional Knowledge System, The Vedas, Main Schools of Philosophy, Ancient Education System, the Takṣaśilā University, the Nālandā University, Alumni, Knowledge Export from Bhārata.

Arts, Literature, and Scholars (3 hours)

Art, Music, and Dance, Naṭarāja– A Masterpiece of Indian Art, Literature, Life and works of Agastya, Lopāmudrā, Vālmīki, Patañjali, Vedavyāsa, Yājñavalkya, Gārgī, Maitreyī, Bodhāyana, Caraka, Suśruta, Jīvaka, Nāgārjuna, Kaṇāda, Patañjali, Kauṭilya, Pāṇini, Āryabhaṭa, Varāhamihira, Ādi Śaṅkarācārya, Bhāskarācārya, Mādhavācārya.

Science, Astronomy, and Mathematics (5 hours)

Concept of Matter, Life and Universe, Gravity, Sage Agastya's Model of Battery, Velocity of Light, Vimāna: Aeronautics, Vedic Cosmology and Modern Concepts, Bhāratīya Kāla-gaṇanā, Kerala School for Mathematics and Astronomy, History and Culture of Astronomy, Sun, Earth, Moon, and Eclipses, Earth is Spherical and Rotation of Earth, Archaeoastronomy; Concepts of Zero and Pi, Number System, Pythagoras Theorem, and Vedic Mathematics.

Life, Environment, and Health (3 hours)

Ethnic Studies, Life Science in Plants, Anatomy, Physiology, Agriculture, Ecology and Environment, Āyurveda, Integrated Approach to Healthcare, Medicine, Microbiology, Medicine, Surgery, and Yoga, etc.

Module-II: Scientific Traditions and Technological Innovations in Indian Knowledge Systems

Foundation concept for Science & Technology (7 hours)

Linguistics & Phonetics in Sanskrit (panini's), Computational concepts in Astadhyayi Importance of Verbs, Role of Sanskrit in Natural Language Processing, Number System and Units of Measurement, concept of zero and its importance, Large numbers & their representation, Place Value of Numerals, Decimal System, Measurements for time, distance and weight, Unique approaches to represent numbers (Bhūta Saṃkhyā System, Kaṭapayādi System), Pingala and the Binary system, Knowledge Pyramid, Prameya – A Vaiśeṣikan approach to physical reality, constituents of the physical reality, Pramāṇa, Saṃśaya.

Indian Science & Technology in IKS (8 hours)

Pre-Harappan and Sindhu Valley Civilization, Laboratory and Apparatus, Juices, Dyes, Paints and Cements, Glass and Pottery, Engineering Science and Technology in the Vedic Age and Post-Vedic Records. Indian Science and Technology Heritage, sixty-four art forms and occupational skills (64 Kalas). Metals and Metal-working technology: Copper, Gold, Zinc, Mercury, Lead, Silver, Iron & Steel. Dyes and Painting Technology, Town & Planning Architecture in India, Temple Architecture, Vastu Sastra.

MIEM210T: ELECTRICAL MACHINES(Minor)

(4 Credits - 60 hours) (L-T-P: 3-1-0)

Pre-requisite: Physics, Basic Electrical Engineering**Objective**

The objective of this course is to equip the students with a basic understanding of different DC & AC machines fundamentals; their different parts and help them to gain the skills for operating these machines. The course also aims to equip students with the ability to understand and analyse the different circuits of DC & AC machines and transformers. The instructor will provide understanding of construction, principle of operation, performance, and control of various electrical machines used in the industry.

Course Outcomes:

The students are expected to have the ability to

Compare the operations of different dc and ac electrical machines. (Understanding)

Apply their knowledge to solve mathematical problems of different electrical machines. (Applying)

Analyze the performance of different electrical machines. (Analyzing)

Select various electric machines for field applications. (Evaluating)

Module I: Magnetic Circuits and Electromechanical Energy Conversion (4 hours)

General introduction to electrical machines: Magnetic circuits, Concepts of reluctance and permeance, Faraday's law of electromagnetic induction, Lenz's Law and Fleming's rules. Principle of operation of generators and motors. Magnetic curves and their relevance.

Module II: Transformers (9 hours)

Constructional features, Principle, and operation of single-phase transformers; Ideal transformer and practical transformer, name plate rating, phasor diagrams, equivalent circuit and determination of its parameters from Open-Circuit and Short-Circuit tests; Per-Unit parameter values and its importance; Voltage Regulation, efficiency and all-day efficiency expressions and calculations. Sumpner's Test (Back-To-Back test or Regenerative test).

3-phase Transformer: As a single unit with name plate rating and as a bank of three single-phase transformers; Vector groups for various connections; Per-phase analysis; Qualitative explanation for origin of harmonic current and voltage and its suppression tertiary winding. Parallel operation conditions and load sharing of transformers.

Autotransformer: Basic constructional features; VA conducted magnetically and electrically. Comparative study with two-winding transformer.

Module III: D.C. Machines (7 hours)

D.C. Machines: Constructional features, armature windings - simple lap and wave winding; armature voltage and torque equations, armature reaction.

D.C. generators: Classifications, performance characteristics; Losses, efficiency and power flow diagram.

D.C. motors: Classifications, torque/speed characteristics of different types; Losses, efficiency and power flow diagram. Starting, speed control and braking. Testing and efficiency.

Module IV: Three-phase Induction machines (8 hours)

Three-phase Induction machines: Constructional features and types; 3-phase distributed winding production of rotating magnetic field. Concept of slip; Phasor diagram and development of equivalent circuit and derivation of torque equation, power flow diagram; Typical torque-slip characteristic and influence of different parameters on it; Methods of starting and speed control; Different types of braking circuit arrangement and qualitative explanation. No-load and blocked-rotor tests.

Module V: Single-Phase AC motors and Universal motors (5 hours)

Single-Phase induction motor: Double revolving field theory and development of equivalent circuit. Methods of starting using auxiliary winding; selection of capacitor value during starting and running.

Universal series motor: constructional features and performance characteristics.

Module VI: Synchronous machines (7 hours)

Synchronous machines: Constructional features and types; Operation of synchronous generators and motors connected to bus and phasor diagrams for normal, under and over excited conditions; Power and torque characteristics and capability curves; Parallel operation; Salient pole synchronous machine - phasor diagram and determination of synchronous reactances; starting and speed control of synchronous motors.

EEDE221T: DIGITAL ELECTRONICS
(4 Credits-60 hours) (L-T-P: 3-1-0)
Objective

The objectives of this course is to introduce the concept of digital and binary systems and give students the concept of digital electronics. The course also provides fundamental concepts used in the design of digital systems, the basic tools for the design and implementation of digital circuits, modules and subsystems.

Course Outcomes

1. Recall and describe fundamental concepts, number systems, Boolean algebra, and digital logic components used in digital electronics. (Remembering)
2. Explain and interpret principles of digital circuit design, logic simplification, combinational and sequential circuits, and data converters. (Understanding)
3. Apply problem-solving techniques to design and simplify digital logic circuits using Boolean algebra and Karnaugh maps. (Applying)
4. Design and implement combinational and sequential circuit. (Creating)

Module I: Digital Systems and Binary numbers: (8 hours)

Digital Systems and Binary numbers: Binary, decimal, octal, hexadecimal number systems, number base conversions, complements, signed binary numbers, binary logic.

Module II: Boolean Algebra and Logic Gates (12 hours)

Boolean Algebra and Logic Gates: Basic theorems and properties of Boolean algebra, Boolean functions, canonical and standard forms, digital logic gates and integrated circuits. Gate Level Minimization: K-Map method, POS and SOP simplifications, don't care conditions, NAND and NOR implementations.

Module III: Digital Logic Families and Introduction to HDL: (8 hours)

Digital Logic Families: CMOS logic, voltage levels, noise margin, power dissipation, fan-in and fan-out. Introduction to HDL: Basic building blocks and syntax of VHDL / Verilog, different modeling styles – structural, behavioral, writing test bench.

Module IV: Combinational Logic (10 hours)

Combinational Logic: Design and analysis of combinational circuits – adders, subtractors, multiplier, magnitude comparators, encoders, decoders and multiplexers.

Module V: Sequential Logic: (12 hours)

Sequential Logic: Design and analysis of sequential circuits – latches, flip-flops, registers and counters.

Module VI: Data Converters: (10 hours)

Data Converters: Basics of digital-to-analog and analog-to-digital conversion – principles, specifications, sample and hold circuits, performance parameters, practical applications and commonly used DAC and ADC ICs.

EECS222T: CONTROL SYSTEMS
(4 Credits - 60 hours) (L-T-P: 3-1-0)
Objective

This course aims to provide students with a solid foundation in control systems, focusing on the analysis and design of various system models and feedback control strategies. Students will learn to mathematically represent mechanical, electrical, thermal, and pneumatic systems using state variable and transfer function models. The course covers closed-loop system analysis, time response, steady-state error, and disturbance rejection. Emphasis is placed on feedback control characteristics, stability criteria, sensitivity analysis, and robustness. Additionally, students will explore basic feedback control modes, frequency response analysis, and compensation techniques.

Course Outcomes

Model dynamic systems from mechanical, electrical, thermal, and pneumatic domains using both state-variable and transfer function approaches. (Applying)

Analyze and design closed-loop control systems by constructing block diagrams, signal flow graphs, and performing time-domain analysis including transient response and steady-state error calculations. (Analyzing)

Apply stability analysis techniques such as Routh-Hurwitz criterion and evaluate system stability using BIBO concepts and sensitivity analysis. (Applying)

Conduct frequency response analysis using Bode, polar, and Nyquist plots, and design lead, lag, and lead-lag compensators to improve system performance. (Analyzing)

Module I: Introduction (16 hours)

Introduction to the control problem, Control System Components: Sensors, Actuators, Computational blocks. Mathematical representation of systems, state variable model, transfer function model. Transfer function and state variable models of suitable mechanical, electrical, thermal and pneumatic systems. Linearization, Solution of state equations of LTI System. Closed loop systems, Block diagram and signal flow analysis.

Module II: Time domain analysis and basics of feedback theory (16 hours)

Time response of first and second order system, steady state error analysis. Performance specifications in the time domain, disturbance rejection. Basic Characteristics of feedback control systems: Concept of BIBO stability, Routh stability criterion. Basic Characteristics of feedback control systems: Concept of BIBO stability, Routh stability criterion.

Module III: Sensitivity analysis (4 hours)

Definition of sensitivity, effects of feedback on sensitivity, It's analysis and robustness.

Module IV: Basic modes of feedback control: (4 hours)

Basic modes of feedback control: Proportional, Integral, Derivative.

Module V: Root Locus (4 hours)

Basics of Root locus and its application.

Module VI: Frequency Domain Analysis (16 hours)

Frequency response analysis: Polar plots, Bode plots, Nyquist stability criterion. Non-minimum phase systems. Performance specifications in frequency domain, Frequency domain methods of design. Lead, lag, lead-lag compensation.

EEPE223T: POWER ELECTRONICS**(4 Credits - 60 hours) (L-T-P: 3-1-0)****Pre-requisite:** Physics, Basic Electrical Engineering**Objective**

The course helps to develop an in-depth understanding of the power electronics devices and circuits for current and voltage control and protection. The course helps in the learning of switching characteristics and various arrangement of power switching devices for realizing rectifier, inverter and choppers and triggering methods of SCRs.

Course Outcomes

Explain the working of different power converters such as rectifiers, choppers and inverters. (Understanding)

Identify different power electronic devices and their characteristics. (Applying)

Compare the various types of power electronics converters and application. (Evaluating)

Choose a suitable type of converter for electrical application and construct.(Creating)

Module I: Power switching devices (8 lectures)

Diode, Thyristor, MOSFET, IGBT: I-V Characteristics; Firing circuit for thyristor; Voltage and current commutation of a thyristor; Gate drive circuits for MOSFET and IGBT.

Module II: Thyristor rectifiers (12 lectures)

Single-phase half-wave and full-wave rectifiers, Single-phase full-bridge thyristor rectifier with R-load and highly inductive load; Three-phase full-bridge thyristor rectifier with R-load and highly inductive load; Input current wave shape and power factor.

Module III: DC-DC buck/ DC-DC boost converter (10 lectures)

Elementary chopper with an active switch and diode, concepts of duty ratio and average voltage, power circuit of a buck converter, analysis and waveforms at steady state, duty ratio control of output voltage. Power circuit of a boost converter, analysis and waveforms at steady state, relation between duty ratio and average output voltage.

Module IV: Single-phase/ Three-phase inverter (18 lectures)

Power circuit of single-phase voltage source inverter, switch states and instantaneous output voltage, square wave operation of the inverter, concept of average voltage over a switching cycle, bipolar sinusoidal modulation and unipolar sinusoidal modulation, modulation index and output voltage. Power circuit of a three-phase voltage source inverter, switch states, instantaneous output voltages, average output voltages over a sub-cycle, three-phase sinusoidal modulation.

Module V: AC to AC conversion (12 lectures)

Single phase AC static switches; transient-free switching of inductive loads; voltage regulators; cycloconverter;

EEEF224T: ELECTROMAGNETIC FIELDS**(4 Credits - 60 hours) (L-T-P: 3-1-0)****Objective**

The objective of the course is to introduce the students to various electromagnetic field related quantities including vector differential and integral operators, electrostatics, magnetostatics and related applications.

Course Outcomes

To understand the basic laws of electromagnetism and obtain the electric and magnetic fields for simple configurations under static conditions.

To analyze time varying electric and magnetic fields.

To understand Maxwell's equation in different forms and different media.

To understand the propagation of EM waves

Module I: Review of Vector Calculus (10 lectures)

Vector algebra- addition, subtraction, components of vectors, scalar and vector multiplications, triple products, Three orthogonal coordinate systems (rectangular, cylindrical, and spherical), Vector calculus differentiation, Partial differentiation, integration, vector operator del, gradient, divergence, and curl; integral theorems of vectors. Conversion of a vector from one coordinate system to another.

Module II: Static Electric Field (8 Lectures)

Coulomb's law, Electric field intensity, Electrical field due to point charges. Line, Surface and Volume charge distributions. Gauss law and its applications, Absolute Electric potential, Potential difference, Calculation of potential differences for different configurations. Electric dipole, Electrostatic Energy and Energy density.

Module III: Conductors, Dielectrics and Capacitance (9 lectures)

Current and current density, Ohms Law in Point form, Continuity of current, Boundary conditions of perfect dielectric materials. Permittivity of dielectric materials, Capacitance, Capacitance of a two-wire line, Poisson's equation, Laplace's equation, Solution of Laplace and Poisson's equation, Application of Laplace's, and Poisson's equations.

Module IV: Static Magnetic Fields (7 lectures)

Biot-Savart Law, Ampere Law, Magnetic flux and magnetic flux density, Scalar and Vector Magnetic potentials. Steady magnetic fields produced by current carrying conductors.

Module V: Magnetic Forces, Materials and Inductance (7 lectures)

Force on a moving charge, Force on a differential current element, Force between differential current elements, Nature of magnetic materials, Magnetization and permeability, Magnetic boundary conditions, Magnetic circuits, inductances, and mutual inductances.

Module VI: Time-Varying Fields and Maxwell's Equations (9 lectures)

Faraday's law for Electromagnetic induction, Displacement current, point form of Maxwell's equation, Integral form of Maxwell's equations, Motional Electromotive forces. Boundary Conditions.

Module VII: Electromagnetic Waves (10 lectures)

Derivation of Wave Equation, Uniform Plane Waves, Maxwell's equation in Phasor form, Wave equation in Phasor form, Plane waves in free space and in a homogenous material. Wave equation for a conducting medium, Plane waves in lossy dielectrics, Propagation in good conductors, Skin effect. Poynting theorem.

EEDS225T: DIGITAL SIGNAL PROCESSING

(4 Credits - 60 hours) (L-T-P: 3-1-0)

Objectives

This course aims to familiarize the student with the concept of signals and systems in discrete domain. Also, the course enables one to represent signals mathematically in continuous and discrete-time, and in the frequency domain. Analysis in Z-domain along with discrete Fourier transform is introduced. Design of digital filters and application of digital signal processing is introduced.

Course Outcomes

Describe signals mathematically in continuous and discrete-time, and in the frequency domain. (Remembering).

Understanding the analytical tools such as Discrete Fourier Transforms, Fast Fourier Transforms and Transforms essential for digital signal processing. (Understanding)

Implement digital signal processing for analysis of real-life signals. (Applying)

Check digital filters for various applications. (Evaluating)

Module I: Discrete-Time Signals and Systems (14 hours)

Discrete time signals and systems: Sequences; representation of signals on orthogonal basis; Representation of discrete systems using difference equations, Sampling, and reconstruction of signals - aliasing; Sampling theorem and Nyquist rate.

Module II: Z-Transform (14 hours)

Time response of first and second order system, steady state error analysis. Performance specifications in the time domain, disturbance rejection. Basic Characteristics of feedback control systems: Concept of BIBO stability, Routh stability criterion. Basic Characteristics of feedback control systems: Concept of BIBO stability, Routh stability criterion.

Module III: Discrete Fourier Transform (10 hours)

Frequency Domain Analysis, Discrete Fourier Transform (DFT), Properties of DFT, Convolution of signals, Fast Fourier Transform Algorithm, Parseval's Identity, Implementation of Discrete Time Systems.

Module IV: Design of Digital Filters (14 hours)

Design of FIR Digital filters: Window method, Park-McClellan's method. Design of IIR Digital Filters: Butterworth, Chebyshev and Elliptic Approximations; Low-pass, Band-pass, Band-stop and High-pass filters. Effect of finite register length in FIR filter design. Parametric and non-parametric spectral estimation. Introduction to multi-rate signal processing.

Module V: Applications of Digital Signal Processing (8 hours)

Correlation Functions and Power Spectra, Stationary Processes, Optimal filtering using ARMA Model, Linear Mean-Square Estimation, Wiener Filter.

EEEM226T: ELECTRICAL MACHINES-II

(4 Credits-60 hours) (L-T-P: 3-1-0)

Objective:

This course provides a basic understanding of AC machinery fundamentals, machine parts and helps to gain the skills for operating AC machines. The course also equips students with the ability to understand and analyse the phasor diagrams and equivalent circuits of AC Induction and Synchronous Machines.

Course Outcomes

Explain the operation of ac machines. (Understanding)

Analyze performance characteristics of ac machines. (Analysing)

Develop equivalent circuits of different ac motors and generators. (Creating).

Demonstrate basic principle of revolving magnetic field (understanding).

Module I: Fundamentals of AC machine windings (10 Hours)

Physical arrangement of windings in stator and cylindrical rotor; slots for windings; single turn coil - active portion and overhang; full-pitch coils, concentrated winding, distributed winding, winding axis, 3D visualization of the above winding types, Air-gap MMF distribution with fixed current through winding - concentrated and distributed, Sinusoidally distributed winding, winding distribution factor

Module II: Pulsating and revolving magnetic fields (10 Hours)

Constant magnetic field, pulsating magnetic field - alternating current in windings with spatial displacement, Magnetic field produced by a single winding - fixed current and alternating current Pulsating fields produced by spatially displaced windings, Windings spatially shifted by 90 degrees, Addition of pulsating magnetic

fields, Three windings spatially shifted by 120 degrees (carrying three-phase balanced currents), revolving magnetic field.

Module III: Induction Machines (16 Hours)

Construction, Types (squirrel cage and slip-ring), Torque Slip Characteristics, Starting and Maximum Torque. Equivalent circuit. Phasor Diagram, Losses and Efficiency. Effect of parameter variation on torque-speed characteristics (variation of rotor and stator resistances, stator voltage, frequency). Methods of starting, braking and speed control for induction motors. Generator operation. Self-excitation. Doubly-Fed Induction Machines.

Module IV: Single-phase induction motors (8 Hours)

Constructional features, double revolving field theory, equivalent circuit, determination of parameters. Split-phase starting methods and applications

Module V: Synchronous machines (16 Hours)

Constructional features, cylindrical rotor synchronous machine - generated EMF, equivalent circuit and phasor diagram, armature reaction, synchronous impedance, voltage regulation. Operating characteristics of synchronous machines, V-curves. Salient pole machine – two reaction theory, analysis of phasor diagram, power angle characteristics. Parallel operation of alternators - synchronization and load division.

EEPE233T: POWER ELECTRONICS AND ITS APPLICATIONS

(3 Credits – 45 Hours) (L-T-P: 3-0-0)

Objective:

The objective of this course is to familiarize students with the fundamentals of power semiconductor devices, conversion techniques, and modern applications of power electronics. Students will learn how to analyze,

design, and apply converter circuits for use in industrial systems, renewable-energy integration, electric drives, and consumer products.

Course Outcomes:

1. Explain the characteristics and operation of power semiconductor devices used in electrical switching and control. (Understanding)
2. Analyze AC–DC, DC–DC, DC–AC, and AC–AC converter circuits and their performance. (Analyzing)
3. Evaluate and design power electronic converters for industrial, renewable-energy, and transportation applications. (Evaluating/Creating)
4. Apply power electronics principles in motor control, power supplies, and energy systems. (Applying)
5. Assess protection, thermal management, and control strategies to ensure safe and efficient operation of power electronic systems. (Evaluating)

Module I: Power Semiconductor Devices (12 hours)

Introduction to Power Electronics and its role in modern systems. Characteristics, operations, and switching behaviour of Power Diodes, Schottky Diodes, SCR, TRIAC, DIAC, BJT, Power MOSFET, IGBT, GTO. Triggering circuits and commutation methods. Safe Operating Area (SOA), dv/dt and di/dt protection. Thermal modelling, heat sinks, snubber circuits.

Module II: AC–DC and DC–DC Converters (12 hours)

AC–DC Converters: Single-phase & three-phase controlled rectifiers, half/fully-controlled converters, harmonics and power factor considerations DC–DC Converters: Buck, boost, buck-boost; PWM control; continuous & discontinuous conduction modes; basic design considerations.

Module III: DC–AC and AC–AC Converters (12 hours)

DC–AC Converters (Inverters): Single-phase & three-phase inverters, SPWM & SVM basics, harmonic reduction. AC–AC Converters: AC voltage controllers, cycloconverters, introduction to matrix converters

Module IV: Applications of Power Electronics (9 hours)

SMPS and UPS basics. Electric drives: DC, induction motor, BLDC/PMSM drives. Renewable energy integration: PV inverters, MPPT basics, wind converters. Electric vehicle power electronics: chargers, motor controllers. HVDC overview, protection, EMI/EMC, gate drivers

Suggested Readings

Non-NEP Batch Syllabus (5th Sem to 8th Sem)**EEPS0117: POWER SYSTEM- I****(3 Credits-45 hours) (L-T-P: 3-0-0)****Course Outcomes**

1. List the various components used in a power system. (Remembering)
2. Different protection schemes used to prevent faults in power system. (Understanding)
3. Identify suitable protection scheme used for a particular type of fault. (Applying)
4. Find various performance parameters of a power system by using given data. (Analyzing)

Objective: This is the basic course, which aims to make students aware of the basic concepts of electrical power systems and spells out the various components of an electrical power system. This course is the stepping-stone to make students understand how to model and analyze the power system under steady state operating conditions, under faulted conditions and the transient behavior of power systems whenever it is subjected to a fault.

Module 1: Basic Concepts (10 hours)

Evolution of Power Systems and Present-Day Scenario. Structure of a power system: Bulk Power Grids and Micro-grids. Synchronous Grids and Asynchronous (DC) interconnections. Generation: Conventional and Renewable Energy Sources. Distributed Energy Resources. Energy Storage. Transmission and Distribution Systems: Line diagrams, transmission and distribution voltage levels and topologies (meshed and radial systems). Review of Three-phase systems. Analysis of simple three-phase circuits. Power Transfer in AC circuits and Reactive Power.

Module 2: Power System Components (18 hours)

Overhead Transmission Lines and Cables: Electrical and Magnetic Fields around conductors, Corona. Parameters of lines and cables. Capacitance and Inductance, calculations for simple configurations. Sinusoidal Steady state representation of Lines: Short, medium and long lines. Characteristics of transmission lines. Surge Impedance Loading.

Causes and effects of faults: Review of per unit system and symmetrical components. Symmetrical three-phase faults. Asymmetrical faults, short circuit and open circuit conditions.

Steady-state performance characteristics. Real and Reactive Power Capability Curve of generators. Loads: Types, Voltage and Frequency Dependence of Loads.

Module 3: Over-Voltages and Insulation Requirements (5 hours)

Generation of Over-voltages: Lightning and Switching Surges. Protection against Over-voltages, Insulation Coordination. Propagation of Surges.

Module 4: Fault Analysis (6 hours)

Method of Symmetrical Components (positive, negative and zero sequences). Balanced and Unbalanced Faults. Representation of generators, lines and transformers in sequence networks. Computation of Fault Currents. Neutral Grounding.

Module 5: Introduction to Protection Systems (6 hours)

Switchgear: Types of Circuit Breakers. Attributes of Protection schemes, Back-up Protection. Protection schemes (Over-current, directional, distance protection, differential protection) and their application.

EECS0073: CONTROL SYSTEMS**(3 Credits - 45 hours) (L-T-P: 3-0-0)****Course Outcomes**

Define feedback and feed-forward control architecture. (Remembering)
 Illustrate the concepts related to the operation analysis and stabilization of closed loop and open loop control systems using various control techniques. (Understanding)
 Apply block diagram representations for simplifying complex control systems. (Applying)
 Examine different controllers based on empirical tuning rules. (Analysing)

Objective

This course aims to familiarize the student with the concept mathematical modelling and analysis of Linear Time-Invariant (LTI) systems. Also, the course enables one to understand the concept of stability and its assessment for linear-time invariant systems. Design of simple feedback controllers is introduced. Mathematical modelling techniques like transfer function and state-space representations are introduced.

Module I: Introduction to Control Problem (5 lecture)

Industrial Control examples. Mathematical models of physical systems. Control hardware and their models. Transfer function models of linear time-invariant systems. Feedback Control: Open-Loop and Closed-loop systems. Benefits of Feedback. Block diagram algebra.

Module II: Time Response Analysis (10 lecture)

Standard test signals. Time response of first and second order systems for standard test inputs. Application of initial and final value theorem. Design specifications for second-order systems based on the time-response. Concept of Stability. Routh-Hurwitz Criteria. Relative Stability analysis. Root-Locus technique. Construction of Root-loci.

Module III: Frequency-Response Analysis (10 lecture)

Relationship between time and frequency response, Polar plots, Bode plots. Nyquist stability criterion. Relative stability using Nyquist criterion – gain and phase margin. Closed-loop frequency response.

Module IV: Introduction to Controller Design (10 lecture)

Stability, steady-state accuracy, transient accuracy, disturbance rejection, insensitivity and robustness of control systems. Root-loci method of feedback controller design. Design specifications in frequency-domain. Frequency-domain methods of design. Application of Proportional, Integral and Derivative Controllers, Lead and Lag compensation in designs. Analog and Digital implementation of controllers.

Module V: State Variable Analysis (10 lecture)

Concepts of state variables. State space model. Diagonalization of State Matrix. Solution of state equations. Eigenvalues and Stability Analysis. Concept of controllability and observability. Pole-placement by state feedback. Discrete-time systems. Difference Equations. State-space models of linear discrete-time systems. Stability of linear discrete-time systems.

EEMM0074: MICROPROCESSORS AND MICROCONTROLLERS

(3 Credits - 45 hours) (L-T-P : 3-0-0)

Course Outcomes

List the various functional blocks of microprocessors and microcontrollers. (Remembering)

Explain the operation and configuration of the various functional blocks and pins of 8051 microcontroller. (Understanding)

Explain the functions of the assembly language instructions of 8051 microcontroller. (Understanding)

Make use of 8051 assembly language instructions to write programs for a given application. (Applying)

Design microcontroller based system for simple applications. (Creating)

Objective

This course provides an in-depth understanding of the architecture and operation of microprocessors and microcontroller, assembly language programming and microcontroller interfacing techniques. The students will be able to design and implement microcontroller-based systems in both hardware and software and can apply this knowledge to more advanced structures.

Module I: Fundamentals of Microprocessors (6 lecture)

Fundamentals of microprocessor architecture. 8-bit microprocessor and microcontroller architecture, Comparison of 8-bit microcontrollers, 16-bit and 32-bit microcontrollers. Definition of embedded system and its characteristics, Role of microcontrollers in embedded Systems. Overview of the 8051 family.

Module II: The 8051 Architecture (9 lecture)

Internal Block Diagram, CPU, ALU, address, data and control bus, Working registers, SFRs, Clock and RESET circuits, Stack and Stack Pointer, Program Counter, I/O ports, Memory Structures, Data and Program Memory, Timing diagrams and Execution Cycles.

Module III: Instruction Set and Programming (8 lecture)

Addressing modes: Introduction, Instruction syntax, Data types, Subroutines Immediate addressing, Register addressing, Direct addressing, Indirect addressing, Relative addressing, Indexed addressing, Bit inherent addressing, bit direct addressing. 8051 Instruction set, Instruction timings. Data transfer instructions, Arithmetic instructions, Logical instructions, Branch instructions, Subroutine instructions, Bit manipulation instruction. Assembly language programs, C language programs. Assemblers and compilers. Programming and debugging tools.

Module IV: Timer, Serial Port and Interrupt Programming (10 lecture)

SFRs of Timers, Timer programming in assembly language and C, RS232 basics, Synchronous and asynchronous communication, SFRs for Serial Communication, Serial Port programming in assembly language and C, Interrupts of 8051, Interrupt programming in assembly language and C.

Module V: External Interfacing and Applications (12 lecture)

External memory interfacing, LED, LCD and keyboard interfacing. Stepper motor interfacing, DC Motor interfacing, ADC and DAC interfacing, sensors interfacing.

EESS0075: SIGNALS AND SYSTEMS

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

At the end of this course, students will be able to:

Define the basic terms related to continuous and discrete time LTI systems. (Remembering)

Classify the signals and systems into continuous-discrete, time varying-time invariant and linear-nonlinear types. (Understanding)

Make use of Fourier, Laplace and z-Transforms techniques in analysis of signals and systems. (Applying)

Examine the signals and systems by using the results of the transform techniques. (Analysing)

Estimate the continuous time equivalence of a discrete signal by applying reconstruction techniques. (Evaluating)

Objective

The Objective of the course is to acquaint the students with the various types of signals, which form the basis of electronic communication. The course also is intended to provide the theoretical background necessary to understand the working of any signal processing system and apply the techniques.

Module I: Introduction to Signals and Systems (10 hours)

Signals and systems as seen in everyday life and in various branches of engineering and science.

Signal properties: periodicity, absolute integrability, determinism and stochastic character.

Some special signals of importance: the unit step, the unit impulse, the sinusoid, the complex exponential, some special time-limited signals;

Continuous and discrete time signals, continuous and discrete amplitude signals.

System properties: linearity: additivity and homogeneity, shift-invariance, causality, stability, realizability. Examples.

Module II: Behaviour of Continuous and Discrete-Time LTI Systems (12 hours)

Impulse response and step response, convolution, input-output behaviour with aperiodic convergent inputs, cascade interconnections. Characterization of causality and stability of LTI systems. System representation through differential equations and difference equations.

State-space Representation of systems. State-Space Analysis, Multi-input, multi-output representation. State Transition Matrix and its Role.

Periodic inputs to an LTI system, the notion of a frequency response and its relation to the impulse response.

Module III: Fourier, Laplace and Z-Transforms (17 hours)

Fourier series representation of periodic signals, Waveform Symmetries, Calculation of Fourier Coefficients. Fourier Transform, convolution/multiplication and their effect in the frequency domain, magnitude and phase response, Fourier domain duality. The Discrete- Time Fourier Transform (DTFT) and the Discrete Fourier Transform (DFT). Parseval's Theorem.

Review of the Laplace Transform for continuous time signals and systems, system functions, poles and zeros of system functions and signals, Laplace domain analysis, solution to differential equations and system behaviour.

The z-Transform for discrete time signals and systems, system functions, poles and zeros of systems and sequences, z-domain analysis.

Module IV: Sampling and Reconstruction (6 hours)

The Sampling Theorem and its implications. Spectra of sampled signals. Reconstruction: ideal interpolator, zero-order hold, first-order hold. Aliasing and its effects. Relation between continuous and discrete time systems.

EEED0076: ELECTRICAL MACHINE DESIGN

(2 Credits - 30 hours) (L-T-P: 2-0-0)

Course Outcomes

Select proper materials for the design of electrical machines. (Remembering)

Design transformer, induction motor and synchronous machine. (Creating)

Execute software programs for designing electrical machines. (Applying)

Module I: Introduction (6 Lectures)

Major considerations in electrical machine design, electrical engineering materials, space factor, choice of specific electrical and magnetic loadings, thermal considerations, heat flow, temperature rise, rating of machines.

Module II: Transformers (6 Lectures)

Sizing of a transformer, main dimensions, kVA output for single and three-phase transformers, window space factor, overall dimensions, operating characteristics, regulation, no-load current, temperature rise in transformers, design of cooling tank, methods for cooling of transformers.

Module III: Induction Motors (6 Lectures)

Sizing of an induction motor, main dimensions, length of air gap, rules for selecting rotor slots of squirrel cage machines, design of rotor bars & slots, design of end rings, design of wound rotor, magnetic leakage calculations, leakage reactance of poly-phase machines, magnetizing current, short circuit current, circle diagram, operating characteristics.

Module IV: Synchronous Machines (6 Lectures)

Sizing of a synchronous machine, main dimensions, design of salient pole machines, short circuit ratio, shape of pole face, armature design, armature parameters, estimation of air gap length, design of rotor, design of damper winding, determination of full load field mmf, design of field winding, design of turbo alternators, rotor design.

Module V: Computer Aided Design (CAD) (6 Lectures)

Limitations (assumptions) of traditional designs, need for CAD analysis, synthesis and hybrid methods, design optimization methods, variables, constraints and objective function, problem formulation. Introduction to FEM based machine design. Introduction to complex structures of modern machines-PMSMs, BLDCs, SRM and claw-pole machines.

EEEW0077: ELECTROMAGNETIC WAVES

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Course Outcomes

Relate the Electromagnetic Field quantities with the behaviour of Electromagnetic Waves. (Understanding)

Model Electromagnetic Wave propagating media for guided and free space propagation. (Applying)

Examine the working conditions of Transmission Lines, Waveguides and Antennae. (Analysing)

Objective

The objective of the course is to introduce the students with the study of the behaviour of electromagnetic waves, which have a one-dimensional spatial dependence (plane waves). The course will also provide a basis for fundamental theoretical as well as practical concepts related to plane waves.

Module I: Transmission Lines (6 lectures)

Introduction, Concept of distributed elements, Equations of voltage and current, Standing waves and impedance transformation, Lossless and low-loss transmission lines, Power transfer on a transmission line, Analysis of transmission line in terms of admittances, Transmission line calculations with the help of Smith chart, Applications of transmission line, Impedance matching using transmission lines.

Module II: Maxwell's Equations (5 lectures)

Basic quantities of Electromagnetics, Basic laws of Electromagnetics: Gauss's law, Ampere's Circuital law, Faraday's law of Electromagnetic induction. Maxwell's equations, Surface charge and surface current, Boundary conditions at media interface.

Module III: Uniform Plane Wave (4 lectures)

Homogeneous unbound medium, Wave equation for time harmonic fields, Solution of the wave equation, Uniform plane wave, Wave polarization, Wave propagation in conducting medium, Phase velocity of a wave, Power flow and Poynting vector.

Module IV: Plane Waves at Media Interface (5 lectures)

Plane wave in arbitrary direction, Plane wave at dielectric interface, Reflection and refraction of waves at dielectric interface, Total internal reflection, Wave polarization at media interface, Brewster angle, Fields and power flow at media interface, Lossy media interface, Reflection from conducting boundary.

Module V: Waveguides (5 lectures)

Parallel plane waveguide: Transverse Electric (TE) mode, transverse Magnetic (TM) mode, Cut-off frequency, Phase velocity and dispersion. Transverse Electromagnetic (TEM) mode, Analysis of waveguide- general approach, Rectangular waveguides.

Module VI: Antennas (5 lectures)

Radiation parameters of antenna, Potential functions, Solution for potential functions, Radiations from Hertz dipole, Near field, Far field, Total power radiated by a dipole, Radiation resistance and radiation pattern of Hertz dipole, Hertz dipole in receiving mode.

EECE0022/ EEED0078: ELECTRONIC DEVICES
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Distinguish between the various types of transistors. (Understanding)
 Outline the principles of semiconductor Physics. (Understanding)
 Describe the mathematical models of semiconductor junctions and MOS transistors for circuits and Systems. (Applying)
 Categorize general specifications and deploy abilities of the electronic devices, and assemblies. (Analyzing)

Module I (8 Lectures)

Semiconductor materials, crystal lattices, bulk crystal growth, epitaxial growth.
 Bonding forces and energy bands in solids, charge carriers in semiconductors- electrons and holes, intrinsic and extrinsic materials; Carrier concentrations- Fermi level, temperature dependence; Drift of carriers- conductivity and mobility.
 Excess carriers in semiconductors- optical absorption, luminescence, carrier lifetime, photoconductivity; Diffusion of carriers- diffusion and recombination.

Module II (8 lectures)

PN junction formation, open circuit condition; forward bias- diffusion current, recombination and total current; Depletion layer capacitance, diffusion capacitance and dynamic resistance; I-V characteristics, and small signal switching models; Avalanche breakdown, Zener diode, Schottky diode.

Module III (8 lectures)

BJT, Construction, Operation, Amplifying Action, Common base (CB) dc characteristics, common base amplifier, common emitter (CE) characteristics, Ebers-Moll Model, Biasing, low frequency small signal model, Coupling and bypass capacitors.

Module IV (8 lectures)

Junction Field Effect Transistor (JFET), JFET amplifier; Metal Oxide Field Effect Transistor (MOSFET) - Field effect and inversion, Enhancement MOSFET, threshold voltage.

Module V (7 lectures)

Light Emitting Diodes (LED), Hetero-junction high intensity LEDs, LED characteristics.
 Solar Cells- Principles of photovoltaic devices, series and shunt resistance, solar cell materials, devices and efficiencies.

PIN diodes, photodiodes, semiconductor optical amplifiers and lasers.

Module VI (6 lectures)

Integrated circuit fabrication process: oxidation, diffusion, ion implantation, photolithography, etching, chemical vapor deposition, sputtering, twin-tub CMOS process, Ion implanted MOS transistors and Poly-Si Gates.

EEPS0079: POWER SYSTEM II

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

- Describe the concept of power System economics and management. (Remembering)
 Explain the method of power system planning, operation and control. (Understanding)
 Carry out numerical analysis for solving power system problems. (Applying)
 Experiments with various load flow method, power quality issues and control of power systems. (Evaluating)

Objective

This course introduces the numerical methods for analyzing the power system in steady state and gives an understanding of the methods to control the voltage, frequency and various stability constraints in a synchronous grid also the monitoring and control and basics of economics of a power system.

Module I: Power Flow Analysis (7 hours)

Review of the structure of a Power System and its components. Analysis of Power Flows: Formation of Bus Admittance Matrix. Real and reactive power balance equations at a node. Load and Generator Specifications. Application of numerical methods for solution of non- linear algebraic equations – Gauss Seidel and Newton-Raphson methods for the solution of the power flow equations. Computational Issues in Large-scale Power Systems.

Module II: Stability Constraints in Synchronous Grids (9 hours)

Swing Equations of a synchronous machine connected to an infinite bus. Power angle curve. Description of the phenomena of loss of synchronism in a single-machine infinite bus system following a disturbance like a three--phase fault. Analysis using numerical integration of swing equations (using methods like Forward Euler, Runge-Kutta 4th order methods), as well as the Equal Area Criterion. Impact of stability constraints on Power System Operation. Effect of generation rescheduling and series compensation of transmission lines on stability.

Module III: Control of Frequency and Voltage (9 hours)

Turbines and Speed-Governors, Frequency dependence of loads, Droop Control and Power Sharing. Automatic Generation Control. Generation and absorption of reactive power by various components of a Power

System. Excitation System Control in synchronous generators, Automatic Voltage Regulators. Shunt Compensators, Static VAR compensators and STATCOMs. Tap-Changing Transformers. Power flow control using embedded dc links, phase shifters.

Module IV: Monitoring and Control (10 hours)

Overview of Energy Control Centre Functions: SCADA systems. Phasor Measurement Units and Wide-Area Measurement Systems. State-estimation. System Security Assessment. Normal, Alert, Emergency, Extremis states of a Power System. Contingency Analysis. Preventive Control and Emergency Control.

Module V: Power System Economics and Management (10 hours)

Basic Pricing Principles: Generator Cost Curves, Utility Functions, Power Exchanges, Spot Pricing. Electricity Market Models (Vertically Integrated, Purchasing Agency, Wholesale competition, Retail Competition), Demand Side-management, Transmission and Distributions charges, Ancillary Services. Regulatory framework.

EEMI0080: MEASUREMENTS AND INSTRUMENTATION

(2 Credits – 30 hours) (L-T-P: 2-0-0)

Objective

This subject is aimed at familiarizing the students with the principle, construction and uses of instruments utilized for the measurement of Current, Voltage, Resistance, Inductance, beside the measurement of passive elements.

Course Outcomes

Define various static characteristics of measurement systems. (Remembering)

Utilize the concepts of various instruments for measuring different electrical and non-electrical quantities (Applying)

Explain instrumentation systems using different sensors and transducers. (Evaluating)

Module I: Concepts Relating to Measurements and Errors (10 hours)

Concepts relating to Measurements: True value, Accuracy, Precision, Resolution, Drift, Hysteresis, Dead-band, Sensitivity.

Errors in Measurements. Basic statistical analysis applied to measurements: Mean, Standard Deviation, Six-sigma estimation, Cp, Cpk.

Module II: Sensors and Transducers (10 hours)

a)Sensors and Transducers for physical parameters: temperature, pressure, torque, flow. Speed and Position Sensors.

b)Current and Voltage Measurements. Shunts, Potential Dividers. Instrument Transformers, Hall Sensors. Measurements of R, L and C.

Module III: Measuring Instruments (10 hours)

Digital Multimeter, True RMS meters, Clamp-on meters, Meggers. Digital Storage Oscilloscope.

CO 1	H		M
CO 2		H	H
CO 3		H	M

EEED0082: ELECTRICAL DRIVES**(3 credits-45 hours) (L-T-P: 3-0-0)****Course Outcomes**

Describe the characteristics of D.C motor and relate the armature voltage control. (Remembering)

Explain the characteristics of the induction motor and recount the torque speed characteristics. (Understanding)

Implement knowledge of working of chopper fed DC drive and identify the quadrant of operation. (Applying)

Interrogate the impact of rotor resistance and assume the slip-ring induction motor for speed control. (Analyzing)

Check the ability to design a three-phase voltage source inverter and define the scalar control of the induction motor. (Evaluating)

Objective

Students will be able to understand and analyze the characteristics of various a.c and d.c motors and demonstrate the speed control using the power electronics converter.

Module I: DC motor characteristics (6 hours)

Review of emf and torque equations of DC machine, evaluation of torque-speed characteristics of separately excited dc motor, change in torque-speed curve with armature voltage, armature voltage control for varying motor speed.

Module II: Chopper fed DC drive and Multi-quadrant DC drive (10 hours)

Review of dc chopper and duty ratio control, chopper fed dc motor for speed control, steady state operation of a chopper fed drive, armature current waveform and ripple, calculation of losses in dc motor and chopper. Review of motoring and generating modes operation of a separately excited dc machine, four-quadrant operation of dc machine.

Module III: Closed-loop control of DC Drive (9 hours)

Control structure of DC drive, inner current loop and outer speed loop, dynamic model of dc motor – dynamic equations and transfer functions.

Module IV: Induction motor characteristics (8 hours)

Review of induction motor equivalent circuit and torque-speed characteristic, variation of torque-speed curve with (i) applied voltage, (ii) applied frequency and (iii) applied voltage and frequency.

Module V: Scalar control and Control of slip ring induction motor (12 hours)

Review of three-phase voltage source inverter, generation of three-phase PWM signals, sinusoidal modulation, space vector theory, conventional space vector modulation; constant V/f control of induction motor, steady-state performance analysis based on equivalent circuit, slip regulation. Impact of rotor resistance of the induction motor torque-speed curve, operation of slip-ring induction motor with external rotor resistance, starting torque, slip power recovery.

EEHV0083: HIGH VOLTAGE ENGINEERING

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Recall the concept of generation and measurement of D. C., A.C., & Impulse voltages. (Remembering)

Understand the basic physics related to various breakdown processes in solid, liquid and gaseous insulating materials. (Understanding)

Analyze the various tests on H. V. equipment and on insulating materials, as per the standards. (Analyzing)

Evaluate the various high voltage transmission system such as HVAC, HVDC etc. (Evaluating)

Objective

The subject helps in the detailed analysis of breakdown that occurs in gaseous, liquids and solid dielectrics and information about generation and measurement of high voltage and current along with high voltage testing methods.

Module I: Breakdown in Gases (8 hours)

Ionization processes and de-ionization processes, Types of Discharge, Gases as insulating materials, Breakdown in Uniform gap, non-uniform gaps, Townsend's theory, Streamer mechanism, Corona discharge.

Module II: Breakdown in liquid and solid Insulating materials (7 hours)

Breakdown in pure and commercial liquids, Solid dielectrics and composite dielectrics, intrinsic breakdown, electromechanical breakdown and thermal breakdown, Partial discharge, applications of insulating materials.

Module III: Generation of High Voltages (7 hours)

Generation of high voltages, generation of high D. C. and A.C. voltages, generation of impulse voltages, generation of impulse currents, tripping and control of impulse generators.

Module IV: Measurements of High Voltages and Currents (7 hours)

Peak voltage, impulse voltage and high direct current measurement method, cathode ray oscillographs for impulse voltage and current measurement, measurement of dielectric constant and loss factor, partial discharge measurements.

Module V: Lightning and Switching Over-voltages (7 hours)

Charge formation in clouds, Stepped leader, Dart leader, Lightning Surges. Switching over voltages, Protection against over-voltages, Surge diverters, Surge modifiers.

Module VI: High Voltage Testing of Electrical Apparatus and High Voltage Laboratories (7 hours)

Various standards for HV Testing of electrical apparatus, IS, IEC standards, Testing of insulators and bushings, testing of isolators and circuit breakers, testing of cables, power transformers and some high voltage equipment, High voltage laboratory layout, indoor and outdoor laboratories, testing facility requirements, safety precautions in H. V. Labs.

EEDS0084: DIGITAL CONTROL SYSTEMS (3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Name different methods available for stability analysis of a system in the digital domain. (Remembering)

Classify various stability states of a system. (Understanding)

Model a system in a discrete domain. (Applying)

Analyse performance of digital controllers and systems. (Analysing).

Objective

This course aims to familiarize the student with the concept of system analysis and design in discrete-domain. Also, the course enables one to understand the concept of discrete representation of LTI systems, design and analyse digital controllers. Design of state feedback and output feedback controllers are introduced.

Module I: Discrete Representation of Continuous Systems (6 hours)

Basics of Digital Control Systems. Discrete representation of continuous systems. Sample and hold circuit. Mathematical Modelling of sample and hold circuit. Effects of Sampling and Quantization. Choice of sampling frequency. ZOH equivalent.

Module II: Discrete System Analysis (6 hours)

Z-Transform and Inverse Z Transform for analysing discrete time systems. Pulse Transfer function. Pulse transfer function of closed loop systems. Mapping from s-plane to z plane. Solution of Discrete time systems. Time-response of discrete time system.

Module III: Stability of Discrete Time System (5 hours)

Stability analysis by Jury test. Stability analysis using bilinear transformation. Design of digital control system with dead beat response. Practical issues with dead beat response design.

Module IV: State Space Approach for Discrete Time Systems (10 hours)

State space models of discrete systems, State space analysis. Lyapunov Stability. Controllability, reachability, Reconstructibility and observability analysis. Effect of pole zero cancellation on the controllability & observability.

Module V: Design of Digital Control System(10 hours)

Design of Discrete PID Controller, Design of discrete state feedback controller. Design of set point tracker. Design of Discrete Observer for LTI System. Design of Discrete compensator.

Module VI: Discrete Output Feedback Control (8 hours)

Design of discrete output feedback control. Fast output sampling (FOS) and periodic output feedback controller design for discrete time systems.

EEDP0085: DIGITAL SIGNAL PROCESSING
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Describe signals mathematically in continuous and discrete-time, and in the frequency domain. (Remembering).

Understanding the analytical tools such as Discrete Fourier Transforms, Fast Fourier Transforms and Z-Transforms essential for digital signal processing. (Understanding)

Implement digital signal processing for analysis of real-life signals. (Applying)

Check digital filters for various applications. (Evaluating)

Objective

This course aims to familiarize the student with the concept of signals and systems in discrete domain. Also, the course enables one to represent signals mathematically in continuous and discrete-time, and in the frequency domain. Analysis in Z-domain along with discrete Fourier transform is introduced. Design of digital filters and application of digital signal processing is introduced.

Module I: Discrete-Time Signals and Systems (6 hours)

Discrete time signals and systems: Sequences; representation of signals on orthogonal basis; Representation of discrete systems using difference equations, Sampling and reconstruction of signals - aliasing; Sampling theorem and Nyquist rate.

Module II: Z-Transform (6 hours)

Z-Transform, Region of Convergence, Analysis of Linear Shift Invariant systems using Z-Transform, Properties of Z-Transform for causal signals, Interpretation of stability in Z-domain, Inverse Z- transforms.

Module III: Discrete Fourier Transform (10 hours)

Frequency Domain Analysis, Discrete Fourier Transform (DFT), Properties of DFT, Convolution of signals, Fast Fourier Transform Algorithm, Parseval's Identity, Implementation of Discrete Time Systems.

Module IV: Design of Digital Filters (15 hours)

Design of FIR Digital filters: Window method, Park-McClellan's method. Design of IIR Digital Filters: Butterworth, Chebyshev and Elliptic Approximations; Low-pass, Band-pass, Band-stop and High-pass filters. Effect of finite register length in FIR filter design. Parametric and non-parametric spectral estimation. Introduction to multi-rate signal processing.

Module V: Applications of Digital Signal Processing (8 hours)

Correlation Functions and Power Spectra, Stationary Processes, Optimal filtering using ARMA Model, Linear Mean-Square Estimation, Wiener Filter.

EEAD0093: ANALOG AND DIGITAL COMMUNICATIONS
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Define different modulation techniques. (Remembering)

Apply probability and random process principles for noise analysis in communication channels. (Applying)

Analyze and compare different analog modulation schemes for their efficiency and bandwidth. (Analysing)

Estimate the inter symbol interference in digital modulation schemes. (Evaluating)

Objective

This course aims to familiarize the students with the concepts of communication systems. The course enables one to understand different modulation techniques both in analog and digital domains. Also, the course enables one to understand the behaviour of a communication channel and errors associated.

Module I: Review of Signals and Systems and Analog Modulation (10 hours)

Review of signals and systems, Frequency domain representation of signals, Principles of Amplitude Modulation Systems- DSB, SSB and VSB modulations. Angle Modulation, Representation of FM and PM signals, Spectral characteristics of angle modulated signals.

Module II: Review of Probability and Random Process and Noise in Different Modulation Schemes (6 hours)

Review of probability and random process. Gaussian and white noise characteristics, Noise in amplitude modulation systems, Noise in Frequency modulation systems. Pre-emphasis and De-emphasis, Threshold effect in angle modulation.

Module III: Pulse Data Communication (8 hours)

Pulse modulation. Sampling process. Pulse Amplitude and Pulse code modulation (PCM), Differential pulse code modulation. Delta modulation, Noise considerations in PCM, Time Division multiplexing, Digital Multiplexers.

Module IV: Signal Detection (6 hours)

Elements of Detection Theory, Optimum detection of signals in noise, Coherent communication with waveforms- Probability of Error evaluations.

Module V: Digital Modulation (15 hours)

Baseband Pulse Transmission- Inter symbol Interference and Nyquist criterion. Pass band Digital Modulation schemes- Phase Shift Keying, Frequency Shift Keying, Quadrature Amplitude Modulation, Continuous Phase Modulation and Minimum Shift Keying. Digital Modulation trade-offs. Optimum demodulation of digital signals over band-limited channels- Maximum likelihood sequence detection (Viterbi receiver). Equalization Techniques. Synchronization and Carrier Recovery for Digital modulation.

EESP0094: POWER SYSTEM PROTECTION
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Recall the basic concepts of CT, PT, relays, CB and power system protection attributes. (Remembering)
 Summarize the different components of a protection system. (Understanding)
 Develop the understanding of digital protection basic principles. (Applying)
 Analyse the various protection schemes for different power system components. (Analysing)
 Evaluate fault current due to different types of fault in a network. (Evaluating)

Objective

The objective of this course is to introduce the students to power system protection problems and the basic concepts of its modeling and analysis. This course introduces the basic theory, construction, usage of current and voltage transformers, relays and circuit breakers. It covers the protection systems used for electric machines, transformers, bus-bars, overhead and underground lines, over-voltages, and digital protection.

Module I: Introduction and Components of a Protection System (8 hours)

Principles of Power System Protection, Relays, Instrument transformers, Circuit Breakers.

Module II: Faults and Over-Current Protection (8 hours)

Review of Fault Analysis, Sequence Networks. Introduction to Over-current Protection and over-current relay coordination.

Module III: Equipment Protection Schemes (12 hours)

Directional, Distance, Differential protection. Transformer and Generator protection. Bus-bar Protection, Bus Bar arrangement schemes. Feeder Protection. Earth fault relays.

Module IV: Digital Protection (8 hours)

Comparators, Introduction and block diagram of numerical relay, Computer-aided protection, Sampling Theorem.

Module V: System Protection and Simulation of Protection Schemes (9 hours)

Effect of Power Swings on Distance Relaying. System Protection Schemes. Under-frequency, Under-voltage and df/dt relays, Out-of-step protection, Synchro-phasors, Simulation of transients.

EERE0095: RENEWABLE ENERGY SYSTEMS
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Choose the most suited energy generation systems for potential locations of applications. (Remembering)
 Understand the basic physics of wind and solar power system.(understanding)
 Identify the potential fields of renewable energy applications. (Applying)
 Examine the power electronic interfaces for renewable energy systems. (Analyzing)

Objective:

The objective of this course is to understand and analyze the importance and potential of renewable energy, study the working principle and mechanism of the different renewable energy sources and to introduce the different renewable energy sources and its application in the current context

Module I: Physics of Wind Power (6 hours)

History of wind power, Indian and Global statistics, Wind physics, Betz limit, Tip speed ratio, stall and pitch control, Wind speed statistics-probability distributions, Wind speed and power-cumulative distribution functions.

Module II: Wind generator topologies (6 hours)

Review of modern wind turbine technologies, Fixed and Variable speed wind turbines, Power electronic converters. Generator-Converter configurations, Converter Control.

Module III: The Solar Resource (5 hours)

Introduction, solar radiation spectra, solar geometry, Earth Sun angles, observer Sun angles, solar day length, Estimation of solar energy availability.

Module IV: Solar Photovoltaic (10 hours)

Technologies-Amorphous, monocrystalline, polycrystalline; V-I characteristics of a PV cell, PV module, array, Power Electronic Converters for Solar Systems, Maximum Power Point Tracking (MPPT) algorithms. Converter Control.

Module V: Network Integration Issues (10 hours)

Overview of grid code technical requirements. Voltage and frequency operating limits, solar PV and wind farm behavior during grid disturbances. Power quality issues. Power system interconnection experiences in the world. Hybrid and isolated operations of solar PV and wind systems, Integration in Smart Grid System.

Module VI: Solar Thermal Power Generation (2 hours)

Technologies, Fresnel reflector, solar pond, elementary analysis.

Module VII: Micro Hydel Generation (3 hours)

Operating principles. Power and Efficiency of Micro Hydel plant. Control, Automation and Monitoring in a Small Hydro Plant. Components of a microhydel power plant, Load balancing.

Module VIII: Bioconversion (3 hours)

Biomass, physical and biological thermal methods of bioconversion. Solid fuels, ethanol, methanol, vegetable oils. Biomass fuels in IC engines. Alcohol fuels, vegetable oils, producer gas.

EEPQ0096: POWER QUALITY AND FACTS
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

List the effect of shunt and series reactive compensation. (Remembering)
 Explain the working principles of FACTS devices. (Understanding)
 Compare performance of various FACTS devices. (Analyzing)
 Experiment with various FACTS devices to mitigate power quality issues. (Evaluating)

Objective

This course gives an introduction to the power quality and application of Flexible Ac Transmission Systems to enhance controllability and power transfer capability in ac systems and involves applications of power electronics devices in power systems to improve reliability of power supply and opens up new opportunities for controlling power and enhancing the usable capacity of present, as well as new and upgraded lines.

Module I: Series/Shunt Reactive Power Compensation (4 hours)

Basics of AC Transmission. Analysis of uncompensated AC transmission lines. Passive Reactive Power Compensation. Shunt and series compensation at the mid-point of an AC line. Comparison of Series and Shunt Compensation.

Module II: Thyristor-based Flexible AC Transmission Controllers (8 hours)

Description and Characteristics of Thyristor-based FACTS devices: Static VAR Compensator (SVC), Thyristor Controlled Series Capacitor (TCSC), Thyristor Controlled Braking Resistor and Single Pole Single Throw (SPST) Switch, Configurations/Modes of Operation, Harmonics and control of SVC and TCSC, Fault Current Limiter.

Module III: Voltage Source Converter based FACTS controllers (12 hours)

Voltage Source Converters (VSC): Six Pulse VSC, Multi-pulse and Multi-level Converters, Pulse-Width Modulation for VSCs, Selective Harmonic Elimination, Sinusoidal PWM and Space Vector Modulation. FACTS controller: Principle of Operation, operation of STATCOM, Reactive Power Control: Type I and Type II controllers, Static Synchronous Series Compensator (SSSC) and Unified Power Flow Controller, Principle of Operation and Control. Working principle of Interphase Power Flow Controller, Other Devices: GTO Controlled Series Compensator.

Module IV: Application of FACTS (8 hours)

Application of FACTS devices for power-flow control and stability improvement, Simulation example of power swing damping in a single-machine infinite bus system using a TCSC, Simulation example of voltage regulation of transmission mid-point voltage using a STATCOM.

Module V: Power Quality Problems in Distribution Systems (8 hours)

Power Quality problems in distribution systems: Transient and Steady state variations in voltage and frequency. Unbalance, Sags, Swells, Interruptions, Wave-form Distortions: harmonics, noise, notching, dc-off-sets, fluctuations. Flicker and its measurement. Tolerance of Equipment: CBEMA curve. Reactive Power Compensation, Harmonics and Unbalance mitigation in Distribution Systems using DSTATCOM and Shunt Active Filters. Synchronous Reference Frame Extraction of Reference Currents. Current Control Techniques in for DSTATCOM.

Module VI: Dynamic Voltage Restorer and Unified Power Quality Conditioner (6 hours)

Voltage Sag/Swell mitigation: Dynamic Voltage Restorer – Working Principle and Control Strategies, Series Active Filtering, Unified Power Quality Conditioner (UPQC): Working Principle. Capabilities and Control Strategies.

EESD0116: POWER SYSTEM DYNAMICS AND CONTROL (3 Credits – 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Define basic terminologies and problems related to power system dynamics. (Remembering)

Understand the problem of power system stability and its impact on the system. (Understanding)

Model different power system components for the study of stability. (Applying)

Analyse steady-state and transient power system dynamics and use numerical integration methods. (Analysing)

Explain the Angular stability analysis in Single Machine Infinite Bus System and in multi-machine systems, frequency and voltage stability, methods to improve stability. (Evaluating)

Objective

The objective of this course is to introduce the students to power stability problems and the basic concepts of modeling and analysis of dynamical systems. Modeling of power system components - generators, transmission lines, excitation and prime mover controllers - is covered in detail. Stability of single machine and multi-machine systems is analyzed using small-signal analysis techniques. The impact of stability problems on power system planning and operation is also brought out.

Module I: Introduction to Power System Operations (3 hours)

Introduction to power system stability. Introduction to Power System Control. Power system stability problem- basic concepts and definitions- rotor angle stability, voltage stability and voltage collapse, classification of stability. Design and operating criteria for stability.

Module II: Analysis of Power System Dynamics and Numerical Methods (5 hours)

Swing Equation. Analysis of Steady State. Analysis of Transient Stability. Equal Area Criterion. Analysis using Numerical Integration Techniques- Euler Method, Modified Euler method, Runge-Kutta method. Numerical approximation of solutions, A-Stability. Numerical stability of explicit integration methods, Stiffness in transient stability. Implicit integration methods.

Module III: Modeling of Synchronous Machines and Associated Controllers (12 hours)

Modeling of synchronous machine: Physical Characteristics. Rotor position dependent model. D-Q Transformation. Model with Standard Parameters. Steady State Analysis of Synchronous Machine. Short Circuit Transient Analysis of a Synchronous Machine. Synchronization of Synchronous Machine to an Infinite Bus. Modeling of Excitation and Prime Mover Systems. Physical Characteristics and Models. Excitation System Control. Automatic Voltage Regulator. Prime Mover Control Systems. Speed Governors.

Module IV: Modeling of other Power System Components (10 hours)

Modeling of Transmission Lines and Loads. Transmission Line Physical Characteristics. Transmission Line Modeling. Load Models - induction machine model. Frequency and Voltage Dependence of Loads. Other Subsystems – HVDC and FACTS controllers, Wind Energy Systems.

Module V: Stability Analysis (11 hours)

Angular stability analysis in Single Machine Infinite Bus System. Angular Stability in multi-machine systems – Intra-plant, Local and Inter-area modes. Frequency Stability: Centre of Inertia Motion. Load Sharing: Governor droop. Single Machine Load Bus System: Voltage Stability. Introduction to Torsional Oscillations and the SSR phenomenon. Stability Analysis Tools: Transient Stability Programs, Small Signal Analysis Programs.

Module VI: Enhancing System Stability (4 hours)

Planning Measures. Stabilizing Controllers (Power System Stabilizers). Operational Measures- Preventive Control. Emergency Control.

EEIS0097: INDUSTRIAL ELECTRICAL SYSTEMS

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Course Outcomes

List the various components and define the various terminologies used in residential, commercial and industrial electrical systems. (Remembering)

Explain the construction, operations and application of various electrical components used and different methods employed in design of residential, commercial and industrial electrical systems. (Understanding)

Determine the ratings of various components used in residential, commercial and industrial electrical systems. (Applying)

Design residential, commercial and industrial electrical systems for a given problem. (Creating)

Objective

The objective of this course is to introduce the students to electrical wiring systems for residential, commercial and industrial consumers. The various concepts related to illumination systems for residential and commercial premises will be studied. Industrial Electrical System Automation is covered in detail.

Module I: Electrical System Components (8 hours)

LT system wiring components, selection of cables, wires, switches, distribution box, metering system, Tariff structure, protection components- Fuse, MCB, MCCB, ELCB, inverse current characteristics, symbols, single line diagram (SLD) of a wiring system, Contactor, Isolator, Relays, MPCB, Electric shock and Electrical safety practices

Module II: Residential and Commercial Electrical Systems (8 hours)

Types of residential and commercial wiring systems, general rules and guidelines for installation, load calculation and sizing of wire, rating of main switch, distribution board and protection devices, earthing system calculations, requirements of commercial installation, deciding lighting scheme and number of lamps, earthing of commercial installation, selection and sizing of components.

Module III: Illumination Systems (8 hours)

Understanding various terms regarding light, lumen, intensity, candle power, lamp efficiency, specific consumption, glare, space to height ratio, waste light factor, depreciation factor, various illumination schemes, Incandescent lamps and modern luminaries like CFL, LED and their operation, energy saving in illumination systems, design of a lighting scheme for a residential and commercial premises, flood lighting.

Module IV: Industrial Electrical Systems I (8 hours)

HT connection, industrial substation, Transformer selection, Industrial loads, motors, starting of motors, SLD, Cable and Switchgear selection, Lightning Protection, Earthing design, Power factor correction – kVAR calculations, type of compensation, Introduction to PCC, MCC panels. Specifications of LT Breakers, MCB and other LT panel components.

Module V: Industrial Electrical Systems II (6 hours)

DG Systems, UPS System, Electrical Systems for the elevators, Battery banks, Sizing the DG, UPS and Battery Banks, Selection of UPS and Battery Banks.

Module VI: Industrial Electrical System Automation (7 hours)

Study of basic PLC, Role of in automation, advantages of process automation, PLC based control system design, Panel Metering and Introduction to SCADA system for distribution automation.

EECA0098: ELECTRICAL ENERGY CONSERVATION AND AUDITING

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Apply the concept of energy management to improve energy efficiency in different electrical systems. (Applying)

Analyze the concepts of different energy efficient devices. (Analyzing)

Choose the appropriate energy conservation methodology for a particular energy source. (Evaluating)

Adapt new and efficient methodology to auditing. (Creating)

Objective

The objective of the course is to introduce energy conservation methodologies and importance of energy audit, measurement, energy performance diagnosis and analysis and carryout financial analysis and cost prediction for energy saving. The course also addresses the energy management issues in various sectors.

Module I: Energy Scenario (6 hours)

Commercial and Non-commercial energy, primary energy resources, commercial energy production, final energy consumption, energy needs of growing economy, long term energy scenario, energy pricing, energy sector reforms, energy and environment, energy security, energy conservation and its importance, restructuring of the energy supply sector, energy strategy for the future, air pollution, climate change. Energy Conservation Act-2001 and its features.

Module II: Basics of Energy and its various forms (7 hours)

Electricity tariff, load management and maximum demand control, power factor improvement, election & location of capacitors, Thermal Basics-fuels, thermal energy contents of fuel, temperature & pressure, heat capacity, sensible and latent heat, evaporation, condensation, steam, moist air and humidity & heat transfer, units and conversion.

Module III: Energy Management & Audit (6 hours)

Definition, energy audit, need, types of energy audit. Energy management (audit) approach understanding energy costs, benchmarking, energy performance, matching energy use to requirement, maximizing system efficiencies, optimizing the input energy requirements, fuel & energy substitution, energy audit instruments. Material and Energy balance: Facility as an energy system, methods for preparing process flow, material and energy balance diagrams.

Module IV: Energy Efficiency in Electrical Systems (7 hours)

Electrical system: Electricity billing, electrical load management and maximum demand control, power factor improvement and its benefit, selection and location of capacitors, performance assessment of PF capacitors, distribution and transformer losses. Electric motors: Types, losses in induction motors, motor efficiency, factors affecting motor performance, rewinding and motor replacement issues, energy saving opportunities with energy efficient motors.

Module V: Energy Efficiency in Industrial Systems (8 hours)

Compressed Air System: Types of air compressors, compressor efficiency, efficient compressor operation, Compressed air system components, capacity assessment, leakage test, factors affecting the performance and savings opportunities in HVAC, Fans and blowers: Types, performance evaluation, efficient system operation, flow control strategies and energy conservation opportunities. Pumps and Pumping System: Types, performance evaluation, efficient system operation, flow control strategies and energy conservation opportunities. Cooling Tower: Types and performance evaluation, efficient system operation, flow control strategies and energy saving opportunities, assessment of cooling towers.

Module VI: Energy Efficient Technologies in Electrical Systems (8 hours)

Maximum demand controllers, automatic power factor controllers, energy efficient motors, soft starters with energy saver, variable speed drives, energy efficient transformers, electronic ballast, occupancy sensors, energy efficient lighting controls, energy saving potential of each technology.

Suggested Readings

Guide books for National Certification Examination for Energy Manager / Energy Auditors Book-1, General Aspects (available online).

Guide books for National Certification Examination for Energy Manager / Energy Auditors Book-3, Electrical Utilities (available online).

CO 3		L		M	L	M
CO 4	L		H	L		

EEEL0096: ELECTRICAL MACHINES**Course Outcomes(3 Credits - 45 hours) (L-T-P: 3-0-0)**

Explain principle of operation of various electrical machines. (Understanding)

Identify different types of dc and ac machines. (Applying)

Classify different types of dc and ac machines. (Analyzing)

Compare the performances in terms of losses, efficiency, and regulation of different types of dc and ac machines. (Evaluating)

Objective

This course on Electrical Machines, generally offered for students who do not major in Electrical Engineering, is an introductory course in electro-mechanical energy conversion devices. This course gives an introduction to DC as well as AC machines and transformers, to enable the students to use this knowledge for applying to situations arising in their disciplines.

Module I: D.C. Machines (15 hours)

Operating principle, generator & motor action, construction, types of excitation, emf & torque equations, power stages & efficiency. Commutation & Armature Reaction, characteristics & application of d.c generators, starting & speed control of d.c motors, characteristics & applications of d.c motors, electric braking.

Design of D.C Machines: Output equation, Main dimensions, Armature design, Armature windings, Design of commutator and brushes, Design of Field systems, Design of interpoles.

Module II: Transformers (10 hours)

Operating principle, classification, construction, emf equation, phasor diagrams, equivalent circuit model, losses & efficiency, voltage regulation, polarity test, autotransformers, three-phase transformer connections, & instrument transformers.

Module III: Induction Machines (10 hours)

Three-phase induction motors. Principle of operation, construction, types. Rotating magnetic field, emf equation of an AC Machine, torque developed in an induction motor, equivalent circuit model, torque-speed characteristics, starting & speed control. Single phase induction motors, starting, application.

Module IV: Synchronous Machines (10 hours)

Construction, types & operating principle of synchronous generator, A.C armature windings, equivalent circuit, phasor diagrams, voltage regulation, parallel operation, synchronization, Power Angle characteristics, effect of field excitation change. Synchronous Motor, principle, starting, hunting, damper windings. Special Purpose Motors: Stepper Motor, Universal Motor, shaded-pole Motor.

EEWE0092: WASTE TO ENERGY

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Select the appropriate method for Biomass pyrolysis, biomass gasification and biomass combustion for waste to energy conversion. (Remembering)

Explain waste management systems with respect to its physical properties, and associated critical considerations in view of emerging technologies. (Understanding)

Implement energy conversion system for conversion of waste to electrical energy. (Applying)

Design cooking stoves, digester, gasifier. (Creating)

Objective

The objective of this course is to introduce different sources, processes to carry on waste to energy conversion. The students will be able to design different systems and devices for converting waste materials to useful energy.

Module I: Introduction to Energy from waste (9 hours)

Classification of waste as fuel, Agro based, Forest residue, Industrial waste, MSW, Conversion devices, Incinerators, gasifiers, digestors.

Module II: Biomass Pyrolysis (9 hours)

Pyrolysis, Types, slow, fast, Manufacture of charcoal, Methods, Yields and application – Manufacture of pyrolytic oils and gases, yields and applications.

Module III: Biomass Gasification (9 hours)

Fixed bed system, Downdraft and updraft gasifiers, Fluidized bed gasifiers, Design, construction and operation, Gasifier burner arrangement for thermal heating, Gasifier engine arrangement and electrical power, Equilibrium and kinetic consideration in gasifier operation.

Module IV: Biomass Combustion (9 hours)

Biomass stoves, Improved chullahs, types, some exotic designs, Fixed bed combustors, Types, inclined grate combustors, Fluidized bed combustors, Design, construction and operation, Operation of all the above biomass combustors.

Module V: Biogas (9 hours)

Properties of biogas (Calorific value and composition), Biogas plant technology and status, Bio energy system, Design and constructional features, Biomass resources and their classification, Biomass conversion processes, Thermo chemical conversion, Direct combustion, Types of biogas Plants, Applications, Alcohol production from biomass, Bio-diesel production, Urban waste to energy conversion, Biomass energy programme in India.

EEOD0099: OPTOELECTRONIC DEVICES

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Describe and show the working of basic optoelectronics devices such as optical sources, detectors, optical amplifiers and connectors, etc. (Remembering)

Explain the nature and performances of various types of optical sources, photodetectors, connectors and couplers (Understanding)

Implement mathematical models to compute the efficiencies and other parameters related to optoelectronic sources, detectors and amplifiers. (Applying)

Check the performance characteristics of optical sources, detectors, optical amplifiers and other optoelectronics components. (Evaluating)

Objective

The course is intended to give the students an exposure to the design criteria for semiconductor optical sources including light emitting diodes and laser diodes, optical detectors, amplifiers and connectors for a variety of applications.

Module I: Sources (15 hours)

Light Emitting Diodes (LEDs), LED Structures, LED types, Fabrication of LED, Light Source Materials, Internal Quantum Efficiency, Modulation Capacity, Transient Response, Power– Bandwidth Product, Laser Diodes, Laser Diode Modes and Threshold Conditions, Single mode operation, Mode locking, Q-switching, Holography, Resonant Frequencies, Laser Diode Structures and Radiation Patterns, Single Mode Lasers, Modulation of Laser Diodes, Temperature Effects, Light Source Linearity, Modal Partition and Reflection Noise.

Module II: Detectors (10 hours)

PIN Photo-Detector, Avalanche Photodiodes, Photo-Detector Noise, Noise Sources, Signal-to-Noise Ratio, Depletion Layer Photocurrent, Response Time, Avalanche Multiplication Noise, Temperature Effects on Avalanche Gain, Photodiode Materials.

Module III: Amplifiers and Switches (10 hours)

Optical Amplifiers, Semiconductor Laser Amplifiers, Fiber Amplifiers, Rare Erbium Doped Fiber Amplifiers, Raman Fiber Amplifiers, Brillouin Fiber Amplifiers, Amplifier Gain, Noise Figure, Bandwidth, Photonic Switching, Integrated Optical Switches.

Module IV: Connectors and Couplers (10 hours)

Cylindrical Ferrule Connector, Bi-Conical Ferrule Connectors, Double Eccentric Connectors, Duplex Fiber Connectors, Expanded Beam Connectors, Beam Splitter, Three Port Couplers, Four Port Couplers, Directional Couplers, Star Couplers, Lenses for Coupling Improvement.

EEEL0100: ELECTRICAL AND ELECTRONICS MATERIALS

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

Describe basic terminologies related to properties of materials used in electrical engineering. (Remembering)
Explain the electrical and thermal characteristics of conducting, semiconducting, insulating and magnetic materials for the manufacturing of electrical machines and electronic components. (Understanding)
Implement advanced studies in solar photovoltaic material for green and clean power generation in view of sustainable development through environmental and safety aspects. (Applying)
Compare different material behavior. (Analyzing)
Check the performance of different electrical materials. (Evaluating)

Objective

The objective of the course is to provide the knowledge of different electrical engineering materials and their applications in designing electrical equipment. The course also provides the study of thermal properties for the efficient design and long-life cycle of electrical equipment.

Module I: Conductors (8 hours)

Classification: High conductivity, high resistivity materials, Fundamental requirements of high conductivity materials and high resistivity materials, Mobility of electron in metals, Factors affecting conductivity and resistivity of electrical material.

Thermoelectric Effect: See back effect, Peltier effect, Thomson effect. Commonly used high conducting materials, properties, characteristics and applications of copper, aluminum, bronze, brass, High resistive materials, Constantan, platinum, nichrome, properties, characteristics, Materials used for AC and DC machines.

Module II: Semiconductors and Superconductors (8 hours)

General concepts, energy bands, Types of semiconductors: intrinsic Semiconductors, extrinsic Semiconductors. Compound semiconductor, amorphous semiconductor. Hall effect, drift, mobility, diffusion in Semiconductors. Semiconductors and their applications.

Superconductors: Superconductivity, Properties of Superconductors, Critical field, Meissner effect, Type-I and type-II Superconductors.

Module III: Dielectrics and Insulators (8 hours)

Properties of gaseous, liquid and solid dielectric, dielectric as a field medium, Electric conduction in gaseous, liquid and solid dielectric, Breakdown in dielectric materials, mechanical and electrical properties of dielectric

materials, Effect of temperature on dielectric materials, polarization, loss angle and dielectric loss. Petroleum based insulating oils, transformer oil, capacitor oils, and properties. Classification of insulation (Solid) and application in AC and DC machines. Solid electrical insulating materials, fibrous, paper boards, yarns, cloth tapes, sleeving wood, impregnation, plastics, filling and bounding materials, fibrous, film, mica, rubber, mica-based materials, ceramic materials.

Module IV: Magnetic Materials (8 hours)

Basic terms, Classification of magnetic material, diamagnetic, paramagnetic, ferromagnetic, antiferromagnetic and amorphous material. Hysteresis loop, magnetic susceptibility, coercive force, curie temperature. Magnetostriction, factors affecting permeability and hysteresis loss. Common magnetic materials, Soft and hard magnetic materials. Electric steel, sheet steel, cold rolled grain-oriented silicon steel, hot rolled grain-oriented silicon steel, hot rolled silicon steel sheet.

Module V: Insulating Materials (6 hours)

Gaseous materials-Oxide gases, electronegative gases, hydrocarbon gases; Liquid materials-mineral oils, silicon liquids, hydrocarbon liquids; Solid Materials-Paper and boards, Resins (Polymers), Rubbers-natural and synthetic, glass, ceramics, asbestos.

Module VI: Modern Engineering Materials (7 hours)

Materials for Electronic Components - Resistors, Capacitors, Inductors, Relays, Bipolar transistors, Field effect transistor (FET), Integrated circuits, Power devices.

Nanotechnology – Introduction, Nano-devices, applications.

Solar/Photovoltaic Cell- Introduction, Photo-generation of charge carriers, p-n junction, Light absorbing materials: Silicon thin films, concentrating photovoltaic.

EESS0075: SIGNALS AND SYSTEMS

(3 Credits - 45 hours) (L-T-P: 3-0-0)

Course Outcomes

At the end of this course, students will be able to:

Define the basic terms related to continuous and discrete time LTI systems. (Remembering)

Classify the signals and systems into continuous-discrete, time varying-time invariant and linear-nonlinear types. (Understanding)

Make use of Fourier, Laplace and z-Transforms techniques in analysis of signals and systems. (Applying)
Examine the signals and systems by using the results of the transform techniques. (Analysing)
Estimate the continuous time equivalence of a discrete signal by applying reconstruction techniques. (Evaluating)

Objective

The Objective of the course is to acquaint the students with the various types of signals, which form the basis of electronic communication. The course also is intended to provide the theoretical background necessary to understand the working of any signal processing system and apply the techniques.

Module I: Introduction to Signals and Systems (10 hours)

Signals and systems as seen in everyday life and in various branches of engineering and science.

Signal properties: periodicity, absolute integrability, determinism and stochastic character.

Some special signals of importance: the unit step, the unit impulse, the sinusoid, the complex exponential, some special time-limited signals;

Continuous and discrete time signals, continuous and discrete amplitude signals.

System properties: linearity: additivity and homogeneity, shift-invariance, causality, stability, realizability. Examples.

Module II: Behaviour of Continuous and Discrete-Time LTI Systems (12 hours)

Impulse response and step response, convolution, input-output behaviour with aperiodic convergent inputs, cascade interconnections. Characterization of causality and stability of LTI systems. System representation through differential equations and difference equations.

State-space Representation of systems. State-Space Analysis, Multi-input, multi-output representation. State Transition Matrix and its Role.

Periodic inputs to an LTI system, the notion of a frequency response and its relation to the impulse response.

Module III: Fourier, Laplace and Z-Transforms (17 hours)

Fourier series representation of periodic signals, Waveform Symmetries, Calculation of Fourier Coefficients. Fourier Transform, convolution/multiplication and their effect in the frequency domain, magnitude and phase response, Fourier domain duality. The Discrete- Time Fourier Transform (DTFT) and the Discrete Fourier Transform (DFT). Parseval's Theorem.

Review of the Laplace Transform for continuous time signals and systems, system functions, poles and zeros of system functions and signals, Laplace domain analysis, solution to differential equations and system behaviour.

The z-Transform for discrete time signals and systems, system functions, poles and zeros of systems and sequences, z-domain analysis.

Module IV: Sampling and Reconstruction (6 hours)

The Sampling Theorem and its implications. Spectra of sampled signals. Reconstruction: ideal interpolator, zero-order hold, first-order hold. Aliasing and its effects. Relation between continuous and discrete time systems.

EEOT0101: OPTIMIZATION TECHNIQUES
(3 Credits - 45 hours) (L-T-P: 3-0-0)
Course Outcomes

Define and explain the importance in solving engineering problems using Linear Programming. (Remembering)

Identify and describe the various types of formulation methods like Simplex Method, Dual Simplex Method. (Understanding)

Establish the need for linear programming and classify different non-linear programming methods in solving system. (Analysing)

Evaluate the performance characteristics of genetic algorithm and particle swarm optimization. (Evaluating)

Objective

This subject introduces optimization theory and its importance in solving of engineering problems. Students can learn linear and nonlinear programming, constrained and unconstrained optimization in this subject

Module I: Introduction & Linear Programming (18 hours)

Importance in solving system engineering problems, Introduction to Linear Programming problem-Formulation, Simplex Method, Dual Simplex Method, Sensitivity Analysis, Duality in Programming.

Module II: Introduction to Nonlinear Programming (10 hours)

Unconstrained optimization-formulation of quadratic optimization problems, gradient descent and steepest descent methods, Quasi-Newton Method, Fibonacci and golden section, Quadratic Interpolation method.

Module III: Constrained Optimization (10 hours)

Direct optimization, Cutting plane methods, methods of feasible direction, analytic center cutting plane methods, Multi-objective optimization-Genetic Algorithm, Kuhn-Tucker conditions.

Module IV: Dynamic Programming (7 hours)

Principle of optimality, recursive equation approach, application to shortest route, Cargo Loading, allocation & production, schedule problems.

EEGE0102: GREEN ENERGY
(3 Credits: 45 Hours) (L-T-P: 3-0-0)
Course Outcomes

List and recognize the various renewable energy resources and their importance. (Remembering)

Summarize the power generation using renewable energy resources. (Understanding)

Identify the potential fields of renewable energy applications. (Applying)

Experiments with modeling of renewable energy resources. (Evaluating)

Objective

The objective of this course is to introduce the different renewable energy resources and their applications. The course helps in understanding the importance and potential of renewable energy resources, the working principles and mechanisms of the different renewable energy sources and their analysis in the current context.

Module I: Introduction (3 hours)

Energy needs of India, classification of energy sources, energy efficiency and energy security, importance of renewable energy resources.

Module II: Solar Energy (11 hours)

Basic concepts, types of collectors, collection systems, photo voltaic (PV) technology: solar thermal effect, solar cells, characteristics of PV systems, equivalent circuit, and array design, building integrated PV system and efficiency calculations, applications.

Module III: Wind Energy (10 hours)

Wind power systems, wind speed and power relation components, turbine types, turbine rating. Choice of generators and site selection, wind energy forecasting, variable speed operation, maximum power operation.

Module IV: Bio energy (9 hours)

Bio-mass and bio-gas: principles of bio-conversion, bio-gas digesters types, gas yield, and combustion characteristics, fermentation and wet processes, applications-utilization for cooking.

Module V: Other renewable energy Resources (12 hours)

Hydro energy, Geothermal energy, ocean thermal energy, wave energy, Tidal energy, waste to energy, heat to energy, Fuel cells: types and applications.

LABORATORY COURSES

**EEEL101L: BASIC ELECTRICAL ENGINEERING LABORATORY
(1 Credit- 30 hours) (L-T-P: 0-0-2)**

Course Outcomes

Find different parameters related to basic electrical circuits. (Remembering)

Explain the procedure for performing experiments related to DC and AC circuits. (Understanding)

Identify various rotating AC and DC machines. (Applying)

Compare the theoretical prediction with experimental results. (Analyzing)

Check errors and correction of meters by calibration (Evaluating)

Construct a circuit to perform a particular experiment. (Creating)

List of experiments:

Calibration of a Voltmeter.

Calibration of an Ammeter.

Calibration of milliammeter as a voltmeter.

Calibration of a millivoltmeter as an ammeter.

Verification of Thevenin's theorem.

Resonance in series RLC circuit

Reversal of direction of rotation of 3-phase induction motor by changing phase sequence.

Different types of Connections of the transformer.

Demonstration of DC and AC machines.

Demonstration of LT switchgear.

EEEM206P: ELECTRICAL MACHINES-I LABORATORY

(1 Credit - 15 hours) (L-T-P: 0-0-2)

Pre-requisite: Basic Electrical Engineering, Electrical Machines-I Theory

Objective

This course aims to familiarize the students with hands-on experiments on different electrical machines and help them to gain the skills for these machines. The instructor will provide understanding of construction, principle of operation, performance, and control of various electrical machines used in the industry.

Course Outcomes

Recall and relate their theoretical knowledge of various electrical machines for different applications. (Remembering)

Explain the experimental procedure and demonstrate their ability to perform experiments related to different electrical machines. (Understanding)

Utilize different machines for different applications, e.g., speed control, voltage control, load tests etc. (Applying)

Evaluate the performance and various operating parameters of different electrical machines. (Evaluating)

List of Experiments:

Experiment to determine self and mutual inductances of two coupled-inductors

Open-circuit and short-circuit tests on single phase transformer and determination of parameters, regulation and efficiency of transformer

Parallel Operation of Two Single Phase Transformers

Determination of the characteristic of a DC Shunt Generator

Determination of equivalent circuits parameters of a Three Phase Induction Motor

Determination of efficiency of DC machine through Hopkinson's Test

(a) Scott Connection of Two Single phase Transformers (b) Vector group test

Determination of OCC, SCC and ZPF characteristics of a 3-phase Synchronous Machine

Synchronization and V-curve of a Synchronous Machine

EENA205P: NETWORK ANALYSIS (LABORATORY)

(1 Credits: 30 hours) (L-T-P:0-0-2)

Pre-requisite: Basic Electrical Engineering Lab

Objective

The primary objectives of a Network Analysis lab are to provide students with a practical understanding of electrical circuits and networks, enabling them to analyze, design, and simulate them using both theoretical knowledge and experimental skills.

COURSE OUTCOMES

The students are expected to have the ability to

Apply circuit theorems such as Superposition, Millman's, and Reciprocity to verify the behavior of electrical networks using both hardware and simulation tools.(Applying)

Analyze the transient response of R-L, R-C, and R-L-C circuits using experimental setups and interpret the impact of component values on circuit performance.(Analyzing)

Measure and interpret frequency response characteristics of LP and HP filters, and *demonstrate* the ability to measure power in a three-phase system using the two-wattmeter method. (Analyzing)

Determine the Z and Y parameters of two-port networks and *evaluate* their significance in electrical network analysis. (Evaluating)

List of the Experiments:

Transient response in R-L and R-C Network: Simulation/ Hardware

Transient response in R-L-C Series and Parallel circuits Network: Simulation/ Hardware

Determination of Impedance (Z) and Admittance (Y) parameters of two port network

Frequency response of LP and HP Filters

Verification voltage and current division

Bridge rectifier with and without filters

Verification of Millman's theorem

Verification of Reciprocity theorem

Measurement of power in a three phase ac circuit using two watt meters method

Verification of the Network Theorem using Hardware, PSpice/Scilab

EEAE204P: ANALOG ELECTRONICS LAB

(1 Credit: 30 hours) (L-T-P: 0-0-2)

Objective: To develop practical skills in designing, simulating, and characterizing analog electronic circuits using diodes, BJTs, MOSFETs, and op-amps (741).

List of Experiments:

Design a test circuit to measure forward/reverse bias characteristics of silicon diode. Extract threshold voltage (V_f), reverse saturation current (I_s), and breakdown voltage from plotted I-V curves. (CO3: Measurement circuit design, CO4: Parameter extraction)

Design a circuit to plot IC vs VCE curves for 2N2222 BJT at three different base currents (20 μ A, 40 μ A, 60 μ A). (CO3: Biasing design, CO4: Parameter calculation)

Design and construct a common-emitter amplifier using NPN BJT to achieve voltage gain of (CO3: Design to spec, CO4: Analyze gain/BW)

Design a common-source amplifier with IRF510 MOSFET. (CO3: Design biasing, CO4: Evaluate linearity)

Implement an inverting amplifier using 741 opamp. (CO3: Component selection, CO4: Test CMRR)

Design non-inverting amplifier using 741 opamp. (CO3: Component selection, CO4: Test CMRR)

Build a differential pair and measure CMRR. (CO3: Balanced design, CO4: CMRR evaluation)

Create symmetrical clipping circuit using 1N4148 diodes. (CO3: Clipping level design, CO4: Distortion measurement)

Design 5.1V regulator maintaining output within 5% for line (9-12V) and load (5-20mA) variations. Measure line/load regulation. (CO3: Zener selection, CO4: Regulation analysis)

Construct balanced modulator. (CO3: Diode matching, CO4: Modulation analysis)

Simulate a half-wave rectifier with $\leq 2\%$ error using 741 and diode. Measure rectification accuracy up to 10kHz and output impedance. (CO3: Opamp-diode integration, CO4: Precision evaluation)

Simulate a 2nd-order Butterworth LPF ($f_c = 1\text{kHz} \pm 5\%$) using 741. Validate cutoff frequency and measure stopband attenuation at 5kHz. (CO3: Filter design, CO4: Freq. Response)

DIGITAL ELECTRONICS LAB

(1 Credit - 30 hours) (L-T-P: 0-0-2)

Objective

This course will enable students to get practical experience in design, realization and verification of Demorgan's Theorem, SOP, POSforms. They will be able to realize Full/Parallel Adders, Subtractors, Multiplexer, Demultiplexers, Decoders, Flip-Flops, Shift registers and counters using logic gates.

Course Outcomes

Demonstrate the truth table of various expressions and combinational circuits using logic gates. (Understanding)

Identify different components of digital electronics. (Applying)

Evaluate various combinational circuits such as adders, subtractors, comparators, multiplexers and de-multiplexers. (Analyzing)

Design various combinational and sequential circuits. (Creating)

List of Experiments:

1. To verify the truth tables of the basic logic gates.
2. To verify De-morgan's Theorem for 2 variables using universal gates.
3. To verify the sum-of product and product-of-sum expressions using universal gates.
4. To design and implement a Full Adder using basic logic gates.
5. To design and implement a Full subtractor using basic logic gates.
6. To design and implement 4-bit Parallel Adder/ subtractor using IC 7483.
7. To realize 4:1 Multiplexer using gates.
8. To realize 1:8 Demux and 3:8 Decoder using IC74138.
9. To realize the following flip-flops using NAND Gates. (a) Clocked SR Flip-Flop (b) JK Flip-Flop.

10. To realize the following shift registers using IC7474 (a) SISO (b) SIPO (c) PISO (d) PIPO.
 11. To realize the Ring Counter and Johnson Counter using IC7476.
 12. To realize the Mod-N Counter using IC7490.

CONTROL SYSTEMS LABORATORY**(1 Credit - 30 hours) (L-T-P: 0-0-2)****Objective**

To enable students to model, analyze, and design feedback control systems through numerical simulation using Python libraries such as NumPy, SciPy, and Matplotlib, with emphasis on time and frequency domain analysis, system stability evaluation, and compensator design.

List of Experiments:

State-space modeling of mechanical system using Python.

Transfer function analysis of RLC circuit using Python.

Time response of second-order system using Python.

Block diagram reduction using matrix methods in Python.

Steady-state error calculation for unity feedback system using Python.

Routh-Hurwitz stability check using Python.

BIBO stability testing with impulse response using Python.

Sensitivity analysis of gain variations using Python.

Frequency response (Bode plot) using Python.

Design and visualization of lead-lag compensators using Python.

POWER ELECTRONICS LABORATORY**(1 Credit –30 hours) (L-T-P: 0-0-2)****Pre-requisite:** Physics, Basic Electrical Engineering**Objective**

The objective of the course is to analyse the various characteristics of the power electronics devices, design and test various arrangements of power devices-based rectifiers and inverters and choppers under power electronics systems.

Course Outcomes

1. Define different power electronics components. (Remembering).
2. Construct various firing circuits of SCR.(Creating)
3. Determine the V-I characteristics of different types of power electronics switches. (Evaluating)
4. Design circuits for AC to DC, DC to DC and DC to AC conversions. (Creating)

List of Experiments:

Study of R, RC and UJT firing circuits.
 Study UJT firing circuits.
 Study of V-I characteristics of SCR.
 Determination of Holding current and Latching current of SCR.
 Single phase half-wave controlled rectifier
 Single phase full-wave controlled bridge rectifier.
 Study of V-I characteristics of MOSFET.
 Study of UJT firing circuit.
 Study of BUCK converter.
 Study of BOOST converter.
 Study of BUCK-BOOST converter.
 Study of Single-phase square wave inverter.
 Study of PWM inverter.

EEMM6042: MICROPROCESSOR AND MICROCONTROLLER LAB**(1 Credits - 30 hours) (L-T-P: 0-0-2)****Course Outcomes**

Demonstrate the usage of Keil software in writing, compiling and debugging 8051 programs (Understanding)

Make use of the 8051 assembly language instructions to write programs for a given problem. (Applying)

Examine the output of each line of an 8051 program code. (Analysing)

List of Experiments

Interfacing of 8051 development kit to PC and programmer.

Data transfer operation from registers and internal data memory.

Addition and subtraction of two 8 bit numbers.

Addition of two 16-bit numbers.

Addition of an array of 8-bit numbers.

Subtraction of two 16-bit numbers.

Multiplication and division of two 8-bit numbers.

Multiplication of two 16-bit numbers.

Interfacing of LEDs and Switches.

Interfacing of seven segment displays.

Interfacing of 16 x 2 LCD.

Interfacing of ADC.

EERS6043: POWER SYSTEMS LABORATORY-I**(1 Credit: 30 hours) (L-T-P: 0-0-2)****Course Outcomes**

Recall the basic concept of programming language. (Remembering)

Demonstrate the ability to model and simulate the compensation techniques in transmission line. (Understanding)

Develop simple model for power system protection. (Applying)

Find various performance parameters of a power system by using given data. (Analyzing)

Experiments with Solar PV cell and formulate the I-V and P-V characteristics of PV panels. (Evaluating)

Objective

This course is the stepping-stone to make students understand how to model and analyze the power system under steady state operating condition, under faulted conditions and the transient behavior of power system whenever it is subjected to a fault.

List of Experiments:

Introduction to simulation software.

To Study the Ferranti Effect of a transmission line/cable.

Reactive power compensation (capacitive/ inductive)

Computation of inductance for overhead transmission line.

Computation of capacitance for overhead transmission line.

Fault current calculation for single line to ground fault.

Computation of power from solar generation.

To Study the over-current relay and the effect of PSM and TSM.

To study the differential Protection of a three-phase delta-delta connected transformer.

EECS6044: CONTROL SYSTEMS LABORATORY

(1 Credit - 30 hours) (L-T-P: 0-0-2)

Course Outcomes

Recall different SciLab functions used in control system analysis. (Remembering)

Understand and simulate the transfer function of a system. (Understanding)

Develop SciLab code for control system analysis. (Applying)

Analyse stability of system with pole-zero map. (Analyzing)

Determine the transient and steady-state of a system. (Evaluating)

Objective

This course aims to familiarize different concepts of control systems with SciLab simulations.

List of experiments:

Part I:

Basics of Scilab

Introduction to SciLab: variables, loop, functions etc.

Matrix operations

Plotting

Introduction to Xcos

Part II:

Concepts of control systems simulation with Scilab

(Any seven experiments from the following list)

To study transfer function of first order and second order systems with SciLab simulations.

To Study the block diagram reduction techniques with SciLab simulations.

To Study the pole-zero plotting with SciLab simulations.

To Study the time-response of a first order system with SciLab simulations.

To Study the time-response of a second order system with SciLab simulations.

To Study the Bode diagram of different systems with SciLab simulations.

To Study the Nyquist diagram of different systems with SciLab simulations.

Transfer function to state-space and state-space to transfer conversion with SciLab simulations.

Speed control of a DC motor with SciLab simulations.

EEMI6045: MINI PROJECT-I (1 Credit)

Course Outcomes

Use different components to make the circuits used in the projects. (Applying)
Examine a designed circuit for expected output. (Analyzing)
Experiment with the designed circuits for the expected results. (Evaluating)
Design circuits to obtain desired output. (Creating)

BTIP13: INTERNSHIP SEMINAR (3 Credits)

Course Outcomes

Relate theory and practical with real life examples. (Remembering)
Explain the engineering processes involved in the industry. (Understanding)
Identify the importance of learning the practical aspects of engineering education. (Applying)
Analyse application of the theory into the practical field. (Analysing)
Value the engineering education and its utility. (Evaluating)
Discuss the actual technological advancements in the industry. (Creating)

EEPS6046: POWER SYSTEMS LABORATORY-II (1 Credits -30 hours) (L-T-P: 0-0-2)

Course Outcomes

Find Y-bus parameters. (Remembering)
Apply knowledge of Y- bus matrix for load flow problem. (Applying)
Analyze load-frequency control in Power System. (Analysing)
Compare performance of series and shunt compensation. (Evaluating)

Experiments

Formation of Y-bus matrix using programming language.
Load flow analysis using Gauss seidel Method.
Load flow analysis using Newton Raphson Method.
Series compensation.
Shunt compensation.
Automatic Load Frequency control.
Automatic Voltage Regulator.
Contingency analysis of the power system.
Application of various numerical methods for power system analysis.
Generation of V-I and V-P characteristics of Solar PV Power Plant.

EEMI6047: MEASUREMENTS AND INSTRUMENTATION LAB
(1 Credits - 30 hours) (L-T-P: 0-0-2)
Course Outcomes

At the end of the course, students will be able to

Select the electrical measuring instruments for determining a particular electrical parameter. (Remembering)

Make use of statistical data analysis and computerized data analysis to determine an unknown electrical parameter. (Applying)

Decide the best methods to determine an electrical parameter. (Evaluating)

List of Experiments:

Measurement of a batch of resistors and estimating statistical parameters.

Measurement of L using a bridge technique as well as LCR meter.

Measurement of C using a bridge technique as well as LCR meter.

Measurement of High resistance and Insulation resistance using Megger.

Usage of DSO for steady state periodic waveforms produced by a function generator.

Download of one-cycle data of a periodic waveform from a DSO and use values to compute the RMS values using a C program.

Usage of DSO to capture transients like a step change in R-L-C circuit.

Current Measurement using Shunt, CT, and Hall Sensor

Measurement of medium resistance using Wheatstone's bridge.

Measurement of three-phase real power using two wattmeter method.

Measurement of three-phase reactive power using two wattmeter method.

Study of smart energy meter.

Measurement of earth resistance using earth tester megger

EEED6055: ELECTRONIC DESIGN LABORATORY
(3 Credits - 45 hours) (L-T-P: 1-0-4)
Course Outcomes

Recall the basic concepts of electrical and electronics measurements. (Remembering)

Classify various OpAmp based amplifiers. (Understanding)

Estimate the output of different electronic components used in the electronic system design. (Evaluating)

Create an electronic system. (Creating)

Objective

This course aims to familiarize the students with the concepts of practical measurement and instrumentation system. The course enables one to understand the concept of data acquisition with popular development boards such as Arduino. At the end of the course, students should be able to design basic electronic systems.

Theory: Electronics Design Concepts (15 hours)

Basic concepts on measurements; Noise in electronic systems; Sensors and signal conditioning circuits; Introduction to electronic instrumentation and PC based data acquisition; Electronic system design, Analog system design. Interfacing of analog and digital systems, Embedded systems, Electronic system design employing microcontrollers, CPLDs, and FPGAs, PCB design and layout; System assembly considerations.

List of Experiments:

To study different temperature sensors.

Study of OpAmp based amplifiers.

Study of instrumentation amplifier.

Study of Arduino microcontroller development board for designing of embedded systems.

Data acquisition using Arduino microcontroller development board.

Group projects involving various electronic hardware.

EEMI6049: MINI PROJECT-II

Course Outcomes

- Recall the benefits of using microcontrollers and microprocessors in circuits. (Remembering)
 Identify suitable controllers and processors among the different controllers and processors available for their work. (Applying)
 Compare the difference between the circuits using controllers and those not using it. (Analysing)
 Construct a fully automotive circuit depending upon their requirement. (Creating)

EEMP6053: MAJOR PROJECT PHASE-I (1 Credit)

Course Outcomes

- Find different areas of research in the field of electrical engineering. (Remembering)
 Explain the importance of research in the chosen topic of interest. (Understanding)
 Apply theoretical knowledge to find out an appropriate topic of importance for research in the undergraduate level. (Application)
 Analyse research work of technological importance published in various reputed national and international journals. (Analysing)
 Decide on a research problem and objective of research to be carried out within a semester. (Evaluating)
 Compile the part of project work completed this semester. (Creating)

During the last year of their study, B. Tech. students are required to take up a major project. This may be an individual project or a group project. The Major Project is an integral learning experience that encourages students to break away from the compartmentalization of the different courses they have studied during the three years of their study and aims to provide opportunities to explore the interrelationships and interconnectedness of the various courses and gather them together into a single learning experience.

The major project focuses upon the following:

Interdisciplinary: The major project provides a platform for students to apply the knowledge and skills acquired from different courses.

Collaboration: It encourages students to work in groups over an extended period of time. They clarify the task, plan their work, share the responsibilities and work towards the successful completion of the project.

Process and Product: Project work focuses on both process and product. The process would include collaboration, gathering and processing of information. The product may take the form of a working model, a complete software package, etc.

Written and Oral presentation: Project work provides students with opportunities to present their findings as a written thesis in a prescribed format and orally with an intended audience and purpose in mind.

During the first phase in the seventh semester, students are expected to choose the project, prepare a synopsis under the guidance of a project supervisor appointed by the department, present the synopsis to the

committee set up for the purpose, get approval for the synopsis and start the project work. Students are expected to submit weekly activity reports and present a progress seminar during this phase. They will also undergo a viva voce examination, in which they will be examined on all the basic areas of the discipline in which they have chosen their project.

VALUE ADDED COURSES

EEAR0112: INTRODUCTION TO ARDUINO AND RASPBERRY PI (2 Credits - 30 hours) (L-T-P:0-1-2)

Course Outcomes

List the different I/O pins available on the Arduino and Raspberry Pi. (Remembering)

Execute software programs on Arduino and Raspberry Pi. (Applying)

Module I : Introduction to Arduino (15 hours)

Introduction to Arduino, Arduino boards and their specification, Arduino integrated development environment, Arduino UNO development board, Programming the Arduino boards, Interfacing LEDs, Interfacing switches, interfacing LCDs, Serial communication, Interfacing analog sensors, PWM control, DC motor interfacing, Servo motor interfacing, Stepper motor interfacing. Circuit design, programming, testing and debugging.

Module II: Introduction to the Raspberry Pi (15 hours)

Introduction to the Raspberry Pi: Features, GPIO. Linux System Administration: Overview, Files & Process, Directories, Basic commands etc. Some common Troubleshooting, Network configuration: interfaces, Configuring the Raspberry Pi: config.txt, cmdline.txt. Pi as Media Centre, Web Server etc. Introduction to python: IDLE, variables, input, loop, installing GPIO library. Hardware hacking, Pi with Arduino, IOT etc.

Suggested Readings:

Arduino Programming: Step-by-step guide to mastering arduino hardware and software by Mark Torvalds
Raspberry Pi User Guide by Gareth Halfacree and Eben Upton

EEAL0113: AUTOCAD ELECTRICAL (2 Credits: 30 hours) (L-T-P : 0-1-2)

Course Outcomes

Demonstrate methods of customizing AutoCAD Electrical symbols, circuits, and databases, title block linking, reporting tools, templates, and project files. (Understanding)

Build schematic drawings such as ladder logic and single wire and multi wire circuits, panel drawings, and PLC-I/O circuits using automated commands for symbol insertion, component tagging, wire numbering, and drawing modification. (Creating)

Objective

The main objective of this course is to learn how to use the powerful electrical drawing creation tools in the AutoCAD Electrical software.

Module I: Introduction to auto CAD Electrical (6 hours)

Introduction to Electrical CAD interface, Electrical Components and wires, Design methodologies, Project files, Accessing project files, Add a drawing to a project file, managing drawings in a project, Project manager Drawing list.

Module II: Schematic I and schematic II (6 hours)

Schematic I: Single wires/ Components, Referencing, Ladders, Insert wires, Edit wires, 3 phase components, Source and destination Signal Arrows, Insert component, parent/child components
Schematic II: Multiwire and circuits, Dashed Link Lines, 3 Phase Ladders.

Module III Editing Commands and panel drawings (6 hours)

Editing commands: Edit Component, Updating Drawings, Scoot & Align, Move & Copy Component, Delete & Surfer Component, Copy Catalogue Assignment, Copy Installation/Location Code Values, Attribute Editing Commands:

Insert Footprint and component, Edit footprint, Assign Item numbers, Add balloons.

Module IV: Terminals and Point-to-Point Wiring Drawings (6 hours)

Terminals: Insert Terminal Symbols, Multiple Level Terminals, Multiple Insert Component command, insert jumpers, Terminal Strip Editor, DIN Rail Command.

Point-to-Point Wiring Drawings: Insert & Edit Connectors, Insert Splices, Insert Multiple Wires, Bend Wires.

Module V: Symbol creation (6 hours)

Schematic Symbols, Naming Convention, Icon Menu Wizard, AutoCAD Electrical Databases, Project & Catalog Databases, Footprint Lookup Database, Insert PLC, Insert Individual PLC I/O Points.

EEEL0114: ELECTRICAL WIRING

(2 Credits - 30 hours) (L-T-P: 0-1-2)

Course Outcomes

Define and explain the difference between direct current and alternating current. (Remembering)

Describe conditions likely to affect severity of electrical shock while maintaining safety during installation. (Remembering)

Demonstrate the different conductor systems used in residential and light commercial wiring in accordance with the codes and authorities for installation. (Applying)

Analyze the essential tools for residential wiring and be able to discuss the basic principles of tool-use and care. (Analysing)

Objective

To improve student electrical wiring skills through systematic training to enable students to create and test different electrical circuits using suitable electrical equipment, wires, protective devices and wiring accessories.

Module I: Basic Electrical Circuits (9 hours)

Measurement of Electrical quantities like Voltage, Currents, Resistance, Impedance, power factor and energy, Various Electrical Symbols, Electricity conductor, insulator, and resistance, Single-phase & three-phase circuits, Serial connection-diagram, Series and Direct Board-different types.

Module II: Different types of electrical wiring / installations (12 hours)

Two-way switch-wiring, 3-phase wiring, Overhead service connection, Definition and testing procedure of voltage current power MCB and bus bars, Earthing Connection – Different earthing systems.

Module III: Fundamentals of electricity-safety measures and precautions, first aid/Tools and equipment (12 hours)

Safely handling Tools & Equipment /Fire Fighting and use of fire extinguishers, Fires in electrical Circuits & Precautions, General Safety of Tools & equipment, Measuring tools, wire gauges etc. Classification, Identification of the electrical equipment cables, wires and electrical accessories.

Module IV: House Wiring Practical (12 hours)

House Wiring by PVC Casing Capping including Testing, House Wiring by PVC Rigid Pipe including Testing, Industrial Wiring by MS Pipe Including Testing, Measurement of Earth Resistance by Earth Tester, Common Faults in AC & DC Fans, Regulators and Remedies.

INTRODUCTION TO ELECTRIC VEHICLES**(2 Credits – 30 hrs) (L - T – P : 2-0-0)****Course Outcomes**

Compare the configurations of hybrid and battery electric vehicles. (Understanding)

Calculate the tractive effort required by electric vehicles. (Applying)

Analyze vehicle dynamics using Matlab Simulink. (Analysing)

Module I: Introduction to Electric Vehicle (5 hrs)

Historical background, Benefits of EVs, Types of EVs, Motor drive technologies, Energy source technologies, Battery charging technologies.

Module II: EV Systems and Configurations (15 hrs)

Components of an EV system, Battery electric vehicle configurations, Hybridization of energy sources, Hybrid electric vehicle configurations. Battery parameters, SoH and SoC estimation and Self Discharge.

Module III: Vehicle Dynamics (10 hrs)

Tractive effort: Aerodynamic drag, Rolling resistance, Uphill resistance, Acceleration force; EV range estimation, Gradability, Matlab-Simulink/Python simulation of tractive effort.

Suggested Readings:

Iqbal Husain, Electric and Hybrid vehicles, Design Fundamentals, CRC Press, 2003.2.

M. Ehsani, Y. Gao, S. Gay and A. Emadi, Modern Electric, Hybrid Electric, and Fuel Cell Vehicles, CRC Press, 2005.

Mapping of COs to Syllabus

CO2	L	L	H
CO3	L	L	H

EEPY0115: PYTHON FOR ELECTRICAL ENGINEERING**(2 Credits: 30 hours) (L-T-P: 0-1-2)****Course Outcomes**

Simulate Electrical Systems using Python. (Applying)

Evaluate the performance of new Electrical designs using Python. (Evaluating)

Construct Electrical systems using Python. (Creating)

Objective

The objective of this course is to familiarize the students with the Python Programming environment and its various applications in simulating Electrical Systems. The course will be a combination of tutorial and practical classes, focusing on hands-on exercises to be done by the students using Python and its various modules.

Module I: Introduction to Python (8 hours)

Python Packages, Anaconda, Python Editors, Resources, Installing Python. Python IDE, Python Shell, Running Python from the Console, Scripting Mode. Basic Python Program, Variables, Built-in Functions, Python Standard Library, Using Python Libraries, Packages and Modules, Plotting in Python.

Module II: Python Programming (6 hours)

Loops in Python programming, Creating Functions in Python, Creating Classes in Python, Creating Python Modules, File Handling in Python, Error Handling in Python, Debugging in Python, Installing and using Python Packages.

Module III: Python for Mathematics Applications (6 hours)

Mathematics in Python, Linear Algebra in Python, Complex Numbers in Python, Differential Equations, Optimization. Using Python for Simulations, Differential Equations, Discrete Systems, Real-Time Simulations.

Module IV: Python for Electrical Engineering Applications (10 hours)

Numerical Methods using Python, Numerical integration, Solving ordinary differential equations, Root finding, Interpolation, Curve fitting, Fourier transforms.

Python used for Control Applications, Transfer Functions, State Space Models, Frequency Response, Stability Analysis.

Applications of Python in- Electromagnetics, Circuit Analysis, Electrical Power Systems, Power Electronics, Signal Processing, Electrical System Modeling and Simulation.

Mapping of COs to Syllabus

Course Outcomes	Module I	Module II	Module III	Module IV
CO 1	M	M		H
CO 2			M	H
CO 3		M	L	H

EESL0200: SERVICE LEARNING (2 Credits – 30 hours)

Course Outcomes

Define and explain the understanding of Community-University Engagement (CUE) and outline CUE in relation to higher education policy in India. (Remembering)

Analyze and identify the social responsibility of higher education institutions to facilitate engaged teaching, research & service. (Analyzing)

Determine the various methods and tools on Community-Based Participatory Research (CBPR). (Evaluating)

Evaluate how Higher education institutions can undertake community engagement post COVID-19. (Evaluating)

Design a plan for the engagement of students with the community through engaged teaching, research and service. (Creating)

Objective

The objective of this course is to understand the theory and practice of community university engagement. The students provide an insight on the theme of Social Responsibility of Higher Education Institution (HEI) and to introduce community based participatory research and the tools to facilitate engaged research.

Module I: Community University Engagement (CUE) (6 hours)

History of Community University Engagement (CUE) in Indian Higher Education Policy, Fostering Social Responsibility by Higher Education: COVID-19 and Beyond, Current status and possible interventions, Recent initiatives, Principles of community engagement,

Module II: Social Responsibility of HEIs (5 hours)

Understanding Social Responsibility of HEIs – Engaged Teaching, Research & Service, Community Engaged teaching and research, Community based participatory research, practice based learning, Community service, Effective Methods and Tools for Engaging Community in Research

Module III: Community Engagement through Electrical and Electronics Engineering (19 hours)

Power sector scenario including generation, transmission, and distribution scenario of India, Duties and responsibilities of Assistant Electricity Meter Reader, Billing and cash collector and their career progression, Develop circuit and wiring diagram and electrical signage, code specifications to plan wiring layouts, consumption points accurately, as may be required, Standard location of service line connection, layout of main switch, circuit breakers required at main board, Install the protective device i.e. ratings as per the load, Replacement of damaged switches, MCB, fan- capacitor, regulator, lighting points i.e. holder, choke, starters, water coolers and their pump & motor, Operate principle of single phase motor, various types of motors like self start, capacitor start, capacitor run, universal motors and their applications and functions of condenser, Earth testing, Build a wind farm model, Application of drone technology in agriculture, search and rescue, wildlife tracking etc.

SCHOOL OF TECHNOLOGY

DEPARTMENT OF MECHANICAL ENGINEERING

VISION

To establish the department as a hub of quality technical education and research for aiding the industry and to strive for the upliftment of the North East Region and nation as a whole.

Mission

To train the youth to be intellectually competent with strong fundamentals in Mechanical engineering.

To create an environment for carrying out fundamentals and interdisciplinary research to address the future needs and challenges of a society and the industry.

To cultivate strong moral values and professional ethics to build them as responsible and environmentally conscious citizens.

To motivate, nourish and mould the students to be dynamic leader and entrepreneurs.

Program educational objectives (PEOs)

To develop the ability to design a system, component or process to meet the social and industrial requirements within realistic constraints.

To achieve high level of technical expertise through extensive curricular and co-curricular training and activities.

To inculcate professional ethics, leadership qualities and inherent creative instincts in students.

To encourage lifelong learning and to foster the ability to function on multi-disciplinary teams.

Program Specific outcomes (PSOs)

PSO 1: To develop the ability to apply the concept of Mechanical engineering for design, development, manufacturing, analysis and maintenance of mechanical systems and processes.

PSO 2: To understand and demonstrate the key concepts related to entrepreneurship, professionalism, effective communication, shop floor management, project management and economics.

DETAILED SYLLABUS

MNWM100L: WORKSHOP/MANUFACTURING PRACTICES

0L:0T:4P 2 Credits

Objectives:

To provide exposure to the students with hands on experience on various basic engineering practices in Civil, Mechanical, Electrical and Electronics Engineering.

To have a study and hands-on-exercise on plumbing and carpentry components.

To have a practice on gas welding, foundry operations and fitting

To have a study on measurement of electrical quantities, energy and resistance to earth.

To have a practice on soldering.

Laboratory Outcomes:

On completion of this laboratory course, students will be able:

CO 1. To fabricate components with their own hands.

CO 2. To relate practical knowledge of the dimensional accuracies and dimensional tolerances possible with different manufacturing processes.

CO 3. To design small devices of their interest by assembling different components.

Module I: Manufacturing Methods- casting, forming, machining, joining, advanced manufacturing methods.

Module II: CNC machining, Additive manufacturing.

Module III: Fitting operations & power tools.

Module IV: Electrical & Electronics.

Module V: Carpentry.

Module VI: Plastic moulding, glass cutting.

Module VII: Metal casting.

Module VIII: Welding (arc welding & gas welding), brazing.

Practicals:

Machine shop

Fitting shop

Carpentry

Electrical & Electronics

Welding shop (Arc welding + Gas welding)

Casting

Smithy

Plastic moulding & Glass Cutting

Examinations could involve the actual fabrication of simple components, utilizing one or more of the techniques covered above.

MNDI101L: DESIGN THINKING & IDEA LABORATORY

2 Credits (L-T-P:1-0-2)

Course Objective:

The objective of this Course is to provide the new ways of creative thinking and learn the innovation cycle of Design Thinking process for developing innovative products which useful for a student in preparing for an engineering career.

Course Outcomes (CO):

Students will able to

Compare and classify the various learning styles and memory techniques and Apply them in their engineering education

Analyze emotional experience and Inspect emotional expressions to better understand users while designing innovative products

Develop new ways of creative thinking and Learn the innovation cycle of Design Thinking process for developing innovative products

Propose real-time innovative engineering product designs and Choose appropriate frameworks, strategies, techniques during prototype development

Perceive individual differences and its impact on everyday decisions and further create a better customer experience

Module 1: An Insight to Learning

Understanding the Learning Process, Kolb's Learning Styles, Assessing and Interpreting

Module 2: Remembering Memory

Understanding the Memory process, Problems in retention, Memory enhancement techniques

Module 3: Emotions: Experience & Expression

Understanding Emotions: Experience & Expression, Assessing Empathy, Application with Peers

Module 4: Basics of Design Thinking

Definition of Design Thinking, Need for Design Thinking, Objective of Design Thinking, Concepts & Brainstorming, Stages of Design Thinking Process (explain with examples) – Empathize, Define, Ideate, Prototype, Test

Module 5: Being Ingenious & Fixing Problem

Understanding Creative thinking process, Understanding Problem Solving, Testing Creative Problem Solving

Module 6: Process of Product Design

Process of Engineering Product Design, Design Thinking Approach, Stages of Product Design, Examples of best product designs and functions, Assignment – Engineering Product Design

Module 7: Prototyping & Testing

What is Prototype? Why Prototype? Rapid Prototype Development process, Testing, Sample Example, Test Group Marketing

Module 8: Celebrating the Difference

Understanding Individual differences & Uniqueness, Group Discussion and Activities to encourage the understanding, acceptance and appreciation of Individual differences

Module 9: Design Thinking & Customer Centricity

Practical Examples of Customer Challenges, Use of Design Thinking to Enhance Customer Experience, Parameters of Product experience, Alignment of Customer Expectations with Product Design

Module 10: Feedback, Re-Design & Re-Create

Feedback loop, Focus on User Experience, Address “ergonomic challenges, User focused design, rapid prototyping & testing, final product, Final Presentation – “Solving Practical Engineering

IDEA LAB WORKSHOP

Objectives:

To learn the skills associated with the tools and inventory associated with the IDEA Lab.

Learn useful mechanical and electronic fabrication processes.

Learn necessary skills to create print and electronic documentation for the system/project

Course Contents

3D printing and prototyping technology

3D scanning, point cloud data generation for reverse engineering.

User Experience (UX) Design: Design Sprints, Create wireframes using Figma, Create mock-ups in Figma.

Electronic component familiarization, Understanding electronic system design flow. Schematic design and PCB layout.

Familiarization and use of basic measurement instruments (CRO, FG, Spectrum Analyser) DMM, Signal and Function Generator, Power Supply, Solar Panel, Battery Types and charging.

BTUH0001: UNIVERSAL HUMAN VALUES I: STUDENT INDUCTION PROGRAM (P/NP)

The following list presents the topics covered in the Mandatory Student Induction Program conducted in the Assam Don Bosco University School of Technology:

Physical activity – Yoga and sports activity (indoor and outdoor)

Creative arts through Extra-curricular clubs e.g., music & singing, dance, drama, debating & quiz, art & craft, photography

Universal Human Values – group discussions on the following topics:

Aspirations and family expectations

Gratitude

Competition and cooperation
Competition and excellence
Peer pressure
Self-confidence
Relationships in family
Trust and respect
Anger management
Happiness and prosperity
Dealing language barriers – tests on communication skill for future follow up.
Sexual orientation / courting / sexual harassment

Literary exposure through Literary Club

Proficiency Modules – Psychological tests and orientation, introduction to Co-curricular clubs and innovations.

Lectures by eminent people – in-campus invited Guests and over SKYPE

Visit to local areas – visit to industry and institutions of repute

Familiarization to departments and common facilities

Mentoring system – introduction and assignment of mentors

Selection / election of Class Representatives for college association

Health check-up for all with documentation for future reference

Library Orientation, Introduction to ERP and e-Resources, filling up “Online anti-ragging affidavit” by all.

BTUH0002: UNIVERSAL HUMAN VALUES II: UNDERSTANDING HARMONY

(3 Credits – 45 hours)

Objective: *The objective of the course is four fold:*

Development of a holistic perspective based on self-exploration about themselves (human being), family, society and nature/existence.

Understanding (or developing clarity) of the harmony in the human being, family, society and nature/existence

Strengthening of self-reflection.

Development of commitment and courage to act.

COURSE / LEARNING OUTCOMES

At the end of this course students will be able to:

CO1: recognize the nature of themselves, and their surroundings (family, society, nature); (understanding)

CO2: identify their responsibility in life, and handle problems with sustainable solutions, while keeping human relationships and human nature in mind. (understanding)

CO3: demonstrate their critical ability and also become sensitive to their commitment towards what they have understood (human values, human relationship and human society). (applying)

CO4: execute what they have learnt to their own self in different day-to-day settings in real life, at least a beginning would be made in this direction. (applying)

Module I: Course Introduction - Need, Basic Guidelines, Content and Process for Value Education (9 hours)

Purpose and motivation for the course, recapitulation from Universal Human Values-I

Self-Exploration—what is it? - Its content and process; ‘Natural Acceptance’ and Experiential Validation—as the process for self-exploration

Continuous Happiness and Prosperity- A look at basic Human Aspirations

Right understanding, Relationship and Physical Facility- the basic requirements for fulfilment of aspirations of every human being with their correct priority

Understanding Happiness and Prosperity correctly- A critical appraisal of the current scenario

Method to fulfil the above human aspirations: understanding and living in harmony at various levels.

Include practice sessions to discuss natural acceptance in human being as the innate acceptance for living with responsibility (living in relationship, harmony and co-existence) rather than as arbitrariness in choice based on liking disliking

Module II: Understanding Harmony in the Human Being - Harmony in Myself! (8 hours)

Understanding human being as a co-existence of the sentient 'I' and the material 'Body'

Understanding the needs of Self ('I') and 'Body' - happiness and physical facility

Understanding the Body as an instrument of 'I' (I being the doer, seer and enjoyer)

Understanding the characteristics and activities of 'I' and harmony in 'I'

Understanding the harmony of I with the Body: Sanyam and Health; correct appraisal of Physical needs, meaning of Prosperity in detail

Programs to ensure Sanyam and Health.

Include practice sessions to discuss the role others have played in making material goods available to me. Identifying from one's own life. Differentiate between prosperity and accumulation. Discuss program for ensuring health vs dealing with disease

Module III: Understanding Harmony in the Family and Society- Harmony in Human-Human Relationship (9 hours)

Understanding values in human-human relationship; meaning of Justice (nine universal values in relationships) and program for its fulfilment to ensure mutual happiness; Trust and Respect as the foundational values of relationship

Understanding the meaning of Trust; Difference between intention and competence

Understanding the meaning of Respect, Difference between respect and differentiation; the other salient values in relationship

Understanding the harmony in the society (society being an extension of family): Resolution, Prosperity, fearlessness (trust) and co-existence as comprehensive Human Goals

Visualizing a universal harmonious order in society- Undivided Society, Universal Order- from family to world family.

Include practice sessions to reflect on relationships in family, hostel and institute as extended family, real life examples, teacher-student relationship, goal of education etc. Gratitude as a universal value in relationships. Discuss with scenarios. Elicit examples from students' lives

Module IV: Understanding Harmony in the Nature and Existence - Whole existence as Coexistence (9 hours)

Understanding the harmony in the Nature

Interconnectedness and mutual fulfilment among the four orders of nature- recyclability and self-regulation in nature. Understanding Existence as Co-existence of mutually interacting units in all-pervasive space

Holistic perception of harmony at all levels of existence.

Include practice sessions to discuss human being as cause of imbalance in nature (film "Home" can be used), pollution, depletion of resources and role of technology etc.

Module V: Implications of the above Holistic Understanding of Harmony on Professional Ethics (10 hours)

Natural acceptance of human values

Definitiveness of Ethical Human Conduct

Basis for Humanistic Education, Humanistic Constitution and Humanistic Universal Order

Competence in professional ethics:

- Ability to utilize the professional competence for augmenting universal human order
- Ability to identify the scope and characteristics of people friendly and eco-friendly production systems,
- Ability to identify and develop appropriate technologies and management patterns for above production systems.

Case studies of typical holistic technologies, management models and production systems

Strategy for transition from the present state to Universal Human Order:

- At the level of individual: as socially and ecologically responsible engineers, technologists and managers
- At the level of society: as mutually enriching institutions and organizations

Sum up Include practice Exercises and Case Studies will be taken up in Practice (tutorial) Sessions eg. Discuss the conduct as an engineer or scientist etc.

MNEM203T : Engineering Mathematics III-Complex Variables, PDE and Probability and statistics (4 Credits - 60 Hours) (3L: 1 T: 0P)

Course Objective :To introduce the solution methodologies for second order Partial Differential Equations with applications in engineering, To provide an overview of probability and statistics to engineers

Module-1: PDE and its Application (16 hrs)

Definition of Partial Differential Equations, Formation of First order partial differential equations, solutions of first order linear PDEs; Solution to homogenous and non-homogenous linear partial differential equations of second order by complimentary function and particular integral method. Separation of variables method to simple problems in Cartesian coordinates, Heat diffusion and vibration problems, D'Alembert's solution of the wave equation; Duhamel's principle for one dimensional wave equation. One dimensional diffusion equation and its solution by separation of variables.

Module-2: Basic Probability and Probability Distribution (16 hrs)

Probability spaces, conditional probability, independence; Discrete random variables, Independent random variables, the multinomial distribution, Poisson approximation to the binomial distribution, infinite sequences of Bernoulli trials, sums of independent random variables; Expectation of Discrete Random Variables, Variance of a sum, Probability distributions: Binomial, Poisson and Normal - evaluation of statistical parameters for these three distributions, Chebyshev's Inequality. distribution functions and densities, normal, exponential and gamma densities. Bivariate distributions and their properties, conditional densities, Bayes' rule.

Module-3: Applied Statistics (8 hrs)

Basic Statistics, Measures of Central tendency: Moments, skewness and Kurtosis - Correlation and regression – Rank correlation. Curve fitting by the method of least squares- fitting of straight lines, second degree parabolas and more general curves. Test of significance: Large sample test for single proportion, difference of proportions, Tests for single mean, difference of means, and difference of standard deviations. Test for ratio of variances - Chi- square test for goodness of fit and independence of attributes.

Textbooks/References:

B. V. Ramana, Higher Engineering Mathematics, Mc Graw Hill Publication.
Babu Ram, Engineering Mathematics, Pearson Publication, ISBN: 978-81-317-8503-4.
Dr. Hari Arora, Probability and Statistics, Katson Publication.
P. G. Hoel, S. C. Port and C. J. Stone, Introduction to Probability Theory, Universal Book Stall, 2003 (Re-print)
S. Ross, A First Course in Probability, 6th Ed., Pearson Education India, 2002.

Course Outcomes:

Upon completion of this course, students will be able to -

- CO1: Determine the solution of partial differential equations by adopting various methods. (Evaluating)
- CO2: Formulate the partial differential equations by range of techniques and to predict the behaviour of certain model physical phenomena. (Create)
- CO3: Define the basic principles of probability theory, the concept of random variables also different methods to find the solution of PDE's. (Remembering)
- CO4: Apply the basic ideas of the measures of central tendency, correlation and regression to solve social and scientific related problems. (Applying)

ECEE0052 :BASIC ELECTRONICS ENGINEERING

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective: This course is intended to give a preliminary understanding of the world of Electronics-Semiconducting materials and basic devices, simple circuits and communication systems. It will also serve to create a better appreciation of going digital and to generate continued interest in the course.

Module I (15 hours)

Semiconductor Devices and Applications: Introduction to types of semiconductors – Intrinsic & Extrinsic, N-type and P-types, Energy Band Diagram; Introduction to P-N junction Diode – Construction, Operation, and V-I characteristics, Static & Dynamic Resistance, Ideal versus Practical, Half wave and Full-wave Rectifiers with and without Filters; Breakdown Mechanisms, Zener diode and its characteristics, Zener diode as voltage regulator; Regulated power supply IC based on 78XX and 79XX series, Introduction to Bipolar Junction Transistor (BJT) – Construction, Operation; BJT Configurations – Common Base, Common Emitter and Common Collector, input-output and transfer characteristics, Operating Point; BJT as a single stage CE amplifier, frequency response and bandwidth.

Module II (15 hours)

Operational Amplifier and its Applications: Introduction to Operational Amplifiers – Equivalent circuit, Transfer Characteristics, Op-Amp input modes and parameters, Ideal Characteristics; Op- Amp in Open Loop Configuration, Op-Amp with Negative Feedback, Concept of Virtual Ground, Practical Op-Amp IC 741, Inverting and Non-inverting Amplifier; Applications of Op-Amp –Summing and Difference Amplifier, Unity Gain Buffer, Comparator, Integrator and Differentiator, Log Amplifier, Instrumentation Amplifier.

Timing Circuits and Oscillators: Oscillators – Basic Features, Barkhausen's criteria for oscillation, R-C phase shift and Wein bridge oscillator; RC-timing circuits, IC 555 and its applications as a stable and mono-stable multi vibrators.

Module III (8 hours)

Digital Electronics Fundamentals: Number System and Boolean Algebra, Basic and Universal Gates – Symbols, Truth tables, logic expressions; Logic simplification using K- map, Logic ICs, Half and Full Adder/Subtractor, Multiplexers, Demultiplexers, Flip-Flops, Shift Registers and Counters; Block diagram of Microprocessor/Microcontroller and their applications.

Module IV (7 hours)

Electronic Communication Systems: The Elements of Communication System, IEEE Frequency Spectrum, Signals and its Classification, Types of Signals; Transmission Media – Wired and Wireless, Baseband and Passband transmission; Modulation – Types of Modulation, Need for modulation, AM and FM Modulation schemes; Mobile communication systems – Cellular Concept and Block Diagram of GSM System.

Course Outcomes

After completing the course successfully the students will be able to-

CO1 : Recall the fundamental concepts of semiconductor devices, operational amplifiers, digital electronics, and communication systems, including their principles, classifications, and basic characteristics.(Remembering)

CO2 : Explain the working principles of electronic circuits, logic systems, and communication techniques, and interpret their functions in engineering applications.(Understanding)

CO3 : Design and analyze basic electronic circuits, such as rectifiers, amplifiers, oscillators, and timing circuits, using semiconductor devices, operational amplifiers, and ICs.(Applying)

CO4 : Implement digital systems using logic gates, adders, multiplexers, and counters, and apply modulation techniques (AM/FM) in practical communication scenarios.(Applying)

Suggested Readings

1. Bell, "Electronic Devices & Circuits" Oxford.
2. Floyd , "Electronic Devices" Pearson Education.
3. R.P. Jain , "Modern Digital Electronics", Tata McGraw Hill.
4. Frenzel, "Communication Electronics: Principles and Applications", Tata McGraw Hill.

MNEM204T :ENGINEERING MECHANICS

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective:

To provide foundational knowledge of statics, dynamics, and mechanics of rigid bodies, including force systems, friction, and equilibrium analysis. It aims to develop skills in analysing Truss, motion, energy principles, and vibrations in mechanical systems. Additionally, it introduces the application of virtual work, stability, and dynamics of rigid and particle systems in engineering contexts.

Module I (9 hours)

a. Force Systems Basic concepts, Particle equilibrium in 2-D and 3-D; Rigid Body equilibrium; System of Forces, Coplanar Concurrent Forces, Components in Space – Resultant- Moment of Forces and its Application; Couples and Resultant of Force System, Equilibrium of System of Forces, Free body diagrams, Equations of Equilibrium of Coplanar Systems and Spatial Systems; Static Indeterminacy.

b. Friction: Types of friction, Limiting friction, Laws of Friction, Static and Dynamic Friction; Motion of Bodies, wedge friction, screw jack and differential screw jack.

Module II (8 hours)

Equilibrium in three dimensions; Method of Sections; Method of Joints; How to determine if a member is in tension or compression; Simple Trusses; Zero force members; Beams and types of beams; Frames and Machines.

Module III (8 hours)

Centroid of simple figures from first principle, centroid of composite sections; Centre of Gravity and its implications; Area moment of inertia- Definition, Moment of inertia of plane sections from first principles,

Theorems of moment of inertia, Moment of inertia of standard sections and composite sections; Mass moment inertia of circular plate, Cylinder, Cone, Sphere, Hook.

Module IV (8 hours)

Virtual displacements, principle of virtual work for particles and ideal system of rigid bodies, degrees of freedom. Active force diagram, systems with friction, mechanical efficiency. Conservative forces and potential energy (elastic and gravitational), energy equation for equilibrium. Applications of energy method for equilibrium. Stability of equilibrium.

Module V (9 hours)

a. Particle dynamics- Rectilinear motion; Plane curvilinear motion (rectangular, path, and polar coordinates). 3-D curvilinear motion; Relative and constrained motion; Newton's 2nd law (rectangular, path, and polar coordinates). Work, kinetic energy, power, potential energy. Impulse-momentum (linear, angular); Impact (Direct and oblique).

b. Introduction to Kinetics of Rigid Bodies- Basic terms, general principles in dynamics; Types of motion, Instantaneous centre of rotation in plane motion and simple problems; D'Alembert's principle and its applications in plane motion and connected bodies; Work energy principle and its application in plane motion of connected bodies; Kinetics of rigid body rotation.

Module VI (8 hours)

Basic terminology, free and forced vibrations, resonance and its effects; Degree of freedom; Derivation for frequency and amplitude of free vibrations without damping and single degree of freedom system, simple problems, types of pendulum, use of simple, compound and torsion pendulums.

Course Outcomes

After completing the course successfully the students will be able to-

CO1 : Recall fundamental principles of mechanics, including force systems, friction, equilibrium, motion, and vibrations, as well as the laws and equations governing them. (Remembering)

CO2 : Explain the concepts of equilibrium in three dimensions, centroid and moment of inertia, virtual work, and energy principles, and describe their applications in solving engineering problems.(Understanding)

CO3 : Apply mechanics principles to solve practical problems related to force analysis, trusses, beams, particle dynamics, and vibration systems. (Applying)

CO4 : Analyze complex mechanical systems for stability, motion, and energy interactions using methods like D'Alembert's principle, work-energy relationships, method of section, method of joint and dynamics of rigid bodies. (Analyzing)

8. Hibler and Gupta, Engineering Mechanics (Statics, Dynamics), Pearson Education.

Alternative NPTEL/SWAYAM Course:

Sr. No	NPTEL/SWAYAM COURSE NAME	Name of Instructor	Hosting Institute

1	Engineering Mechanics Statics and Dynamics	Prof. Anubhab Roy Prof. Mahesh Panchagnula	IIT Madras
2	Mechanics	Prof. A. Dasgupta	IIT Kharagpur
3	Engineering Mechanics	Prof. U.S. Dixit and Dr. G. Saravana Kumar	IIT Guwahati

MNBT205T :BASIC THERMODYNAMICS**(4 Credits – 60 hours) (L-T-P: 3-1-0)**

Objective: To provide an in-depth understanding of thermodynamic principles, including the laws of thermodynamics, entropy, and thermodynamic properties of substances. It aims to develop knowledge on air standard cycles and internal combustion engines, along with their performance and efficiency.

Module I (12 hours)

Thermodynamic System and Control volume; Property, State and Process, Exact and Inexact differentials, Work -Thermodynamic definition of work, Displacement work; Path dependence of displacement work and illustrations for simple processes; Thermodynamics equilibrium. Temperature, Definition of thermal equilibrium and Zeroth law; Temperature scales; Various Thermometers. Definition of heat; examples of heat and work interaction in systems. First Law for cyclic and non-cyclic processes; Limitation of first law of thermodynamics, Internal energy and Enthalpy.

Module II (13 hours)

a) First Law for Flow Processes - Derivation of general energy equation for a control volume; Steady state steady flow processes; Examples of steady flow devices; Unsteady processes; examples of steady and unsteady I law applications for system and control volume.

b) Second law : Definitions of direct and reverse heat engines; Definitions of thermal efficiency and COP; Kelvin-Planck and Clausius statements; Definition of reversible process; Internal and external irreversibility; Carnot cycle; Carnot's theorem, Corollary of Carnot theorem, Clausius theorem; Definition of entropy; Inequality of Clausius, Principle of increase of entropy; Change of entropy undergoing different processes

Module III (12 hours)

Definition of Pure substance, p-v diagram, p-T diagram, p-v-T diagram, T-s diagram for a Pure Substance, h-s diagram, Mollier diagram, Dryness Fraction, Charts of Thermodynamic Properties. Equation of State of a Gas, Ideal Gas, Specific Heats, Internal Energy, Enthalpy and Entropy of an Ideal Gas, Equations of State, Compressibility Charts, Properties of Mixtures of Gases- Dalton's law of Partial Pressures, Internal Energy, Enthalpy and Specific Heats of Gas Mixtures.

Module IV (10 hours)

Air standard cycle assumptions, working; efficiency of Otto cycle, Diesel cycle, Dual cycle, Brayton cycle and Stirling cycle. Comparison of Otto cycle, Diesel cycle and Dual cycle.

Module V (13 hours)

Definition of Engine, classification of IC Engines, Performance Parameters, Construction and Working principle of four-stroke and two-stroke engine, Petrol Engine, Diesel Engine, Comparison between Petrol and Diesel Engine.

Course Outcomes

After completing the course successfully the students will be able to-

CO1 : Recall the fundamental principles of thermodynamics, including system properties, laws of thermodynamics, heat and work interactions, and thermodynamic cycles, as well as the construction and classification of IC engines. (Remembering)

CO2 : Explain the concepts of thermal equilibrium, entropy, properties of pure substances, air standard cycles and the working principles of internal combustion engines, along with their efficiency. (Understanding)

CO3 : Apply the first and second laws of thermodynamics, entropy principles etc. to solve problems for various open and closed systems. (Applying)

CO4 : Interpret thermodynamic property charts and equations of state for pure substances and gas mixtures to determine thermodynamic properties and predict system behaviour. (analysis)

MNFM206T : FLUID MECHANICS AND HYDRAULIC MACHINES**(4 Credits – 60 hours) (L-T-P: 3-1-0)****Objective:**

To introduce fundamental concepts of fluid properties, pressure measurement, and fluid forces, teach principles of fluid dynamics including flow types, boundary layers, and dimensional analysis, and explore the working principles and performance of rotodynamic machines, pumps, and turbines.

Module I (6 hours)

Definition of fluid, Units and dimensions-Properties of fluids, Pascal law, Pressure measurement manometer, types of manometer and its application, Newton's law of viscosity, Forces on submerged plane and curved surfaces, buoyant force, metacentre, centre of buoyancy, equilibrium of floating and submerged body.

Module II (11 hours)

Types of fluid flow: steady, unsteady, uniform, non-uniform, laminar, turbulent, compressible, incompressible, rotational, irrotational, one, two, three dimensional flows, velocity, acceleration, Velocity potential function, Stream function. Control volume- application of continuity equation and momentum equation, flow net, Vortex flow Bernoulli's equation and its applications to Venturimeter, Orificemeter and Pitot tube and Notches.

Module III (15 hours)

Exact flow solutions in channels and ducts, Laminar flow, Velocity distribution, mean velocity, velocity profile Kinetic energy factor and momentum Couette and Poiseuille flow, laminar flow through circular conduits and circular annuli. Turbulent flow: Reynold's experiment, laws of fluid friction, shear stress, types of boundary, Prandtl length concept, velocity distribution, mean velocity, velocity profile, resistance to flow in smooth and rough pipes, Darcy Weisbach equation, friction factor, Moody's diagram.

Module IV (7 hours)

Concept of boundary layer, laminar boundary layer, turbulent boundary layer, Laminar sub layer, Boundary layer thickness, displacement thickness, momentum thickness, energy thickness. Flow around submerged bodies- Introduction to concept and expression of drag and lift, pressure drag and friction drag, Streamlined and Bluff bodies.

Module V (4 hours)

Need for dimensional analysis, Buckingham's pi theorem and its application. Similitude – types of similitude Dimensionless parameters – application of dimensionless parameters – Model analysis.

Module VI (9 hours)

Euler's equation – theory of Rotodynamic machines – various efficiencies – velocity components at entry and exit of the rotor, velocity triangles – Centrifugal pumps, working principle, work done by the impeller, performance curves – Cavitation in pumps-Reciprocating pump – working principle.

Module VII (8 hours)

Classification of water turbines, heads and efficiencies, velocity triangles- Axial, radial and mixed flow turbines- Pelton wheel, Francis turbine and Kaplan turbines.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Define fundamental fluid properties, types of flows, pressure measurement techniques, and the principles governing submerged bodies and equilibrium.(Remembering)

CO2: Explain the concepts of fluid dynamics, including Bernoulli's equation, flow characteristics, boundary layer theory, and dimensional analysis with practical implications.(Understanding)

CO3: Apply the principles of fluid flow, dimensional analysis, and boundary layer theory to solve engineering problems, including designing and analyzing hydraulic machines and systems.(Applying)

CO4: Evaluate the performance of rotodynamic machines, pumps, and turbines by interpreting velocity triangles, efficiencies, and flow characteristics for improved system design and analysis of dimensional analysis and model analysis .(Analyzing)

ENVIRONMENTAL SCIENCE**(NC– 30 hours) (L-T-P: 2-0-0)**

Objective: To create awareness about the multidisciplinary nature of environmental studies, highlighting the importance of natural resource conservation, ecosystem dynamics, and biodiversity. It explores the causes, effects, and mitigation strategies for environmental pollution and discusses critical social issues such as sustainable development and disaster management. Additionally, it examines the interrelation between human population, health, and environmental challenges, emphasizing the role of information technology in environmental sustainability.

Module I: The Multidisciplinary Nature of Environmental Studies (3 lectures)

Definition, scope and importance, need for public awareness.

Module II: Natural Resources (3 lectures)

a) Different types of natural resources and associated problems - forest resources, water resources, mineral resources, food resources, energy resources, land resources.

b) Conservation of natural resources.

Module III: Ecosystems (4 lectures)

a) Concept of an ecosystem, structure and function of an ecosystem, producers, consumers and decomposers, energy flow in the ecosystem, food chains, food webs.

b) Structure of following ecosystems - forest ecosystem, grassland ecosystem, desert ecosystem, aquatic ecosystems.

Module IV: Biodiversity and Its Conservation (4 lectures)

Types of biodiversity – genetic, species and ecosystem, value of biodiversity, global biodiversity, India as a mega-diversity nation, threats to biodiversity, conservation of biodiversity - in-situ and ex-situ conservation.

Module V: Environmental Pollution (6 lectures)

a) Definition, causes, effects and control measures of - air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, nuclear hazards and e- pollution.

b) Solid waste management

c) Disaster management

Module VI: Social Issues and the Environment (6 lectures)

a) From unsustainable to sustainable development, urban problems related to energy, water conservation, rain water harvesting, climate change, global warming, acid rain, ozone layer depletion.

b) Environment protection act.

c) Introduction to environmental impact assessment.

Module VII: Human Population and the Environment (4 lectures)

Population growth and sex ratio; Population explosion - family welfare programme; Environment and human health; HIV/AIDS; Role of information technology in environment and human health.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall key concepts related to natural resources, ecosystems, biodiversity, types of pollution, and associated environmental acts and regulations. (Remembering)

CO2: Explain the interrelationships between biodiversity, resource management, and the effects of human activities on environmental sustainability. (Understanding)

CO3: Apply environmental principles and sustainable practices to propose solutions for issues like pollution control, disaster management, and conservation efforts. (Applying)

Suggested Readings

1. Erach Bharucha, Textbook of Environmental Studies, UGC, New Delhi
2. J.P. Sharma, Environmental Studies, University Science Press

MIKS0109T: Introduction to Indian Knowledge Systems (2 Credits - 30 Hours)

Course Objectives

To introduce fundamentals of Ancient Indian Educations to understand the pattern and purpose of studying vedas, vedangas, upangas, upveda, purana & Itihasa

To help students to trace, identify and develop the ancient knowledge systems.

To help to understand the apparently rational, verifiable and universal solution from ancient Indian knowledge system for the holistic development of physical, mental and spiritual wellbeing

To build in the learners a deep rooted pride in Indian knowledge, committed to universal human right, well-being and sustainable development.

Course Outcomes

After completing the course, the students will be able to-

CO1: Identify the foundational elements of Bhāratīya civilization, including its knowledge systems, educational institutions, and philosophical traditions. (*Understanding*)

CO2: Apply traditional Indian approaches to language, logic, measurement systems, and physical reality to modern interdisciplinary contexts. (*Applying*)

CO3: Analyse the contributions of key scholars and literary figures in the development of Indian arts, sciences, and philosophy. (*Analysing*)

CO4: Evaluate the scientific principles and technological innovations from ancient India in the areas of mathematics, astronomy, medicine, and environmental studies. (*Evaluating*)

Detailed Syllabus

Module-I: Foundations of Indian Knowledge Systems and Civilisational Heritage

a. Bhāratīya Civilization and Development of Knowledge System (4 hours)

Genesis of the land, Antiquity of civilization, On the Trail of the Lost River, Discovery of the Saraswatī River, the Saraswatī-Sindhu Civilization, Traditional Knowledge System, The Vedas, Main Schools of Philosophy, Ancient Education System, the Takṣaśilā University, the Nālandā University, Alumni, Knowledge Export from Bhārata.

b. Arts, Literature, and Scholars (3 hours)

Art, Music, and Dance, Naṭarāja– A Masterpiece of Indian Art, Literature, Life and works of Agastya, Lopāmudrā, Vālmīki, Patañjali, Vedavyāsa, Yājñavalkya, Gārgī, Maitreyī, Bodhāyana, Caraka, Suśruta, Jīvaka, Nāgārjuna, Kaṇāda, Patañjali, Kauṭīlya, Pāṇini, Āryabhaṭa, Varāhamihira, Ādi Śaṅkarācārya, Bhāskarācārya, Mādhavācārya.

c. Science, Astronomy, and Mathematics (5 hours)

Concept of Matter, Life and Universe, Gravity, Sage Agastya's Model of Battery, Velocity of Light, Vimāna: Aeronautics, Vedic Cosmology and Modern Concepts, Bhāratīya Kāla-gaṇanā, Kerala

School for Mathematics and Astronomy, History and Culture of Astronomy, Sun, Earth, Moon, and Eclipses, Earth is Spherical and Rotation of Earth, Archaeoastronomy; Concepts of Zero and Pi, Number System, Pythagoras Theorem, and Vedic Mathematics.

d. Life, Environment, and Health (3 hours)

Ethnic Studies, Life Science in Plants, Anatomy, Physiology, Agriculture, Ecology and Environment, Āyurveda, Integrated Approach to Healthcare, Medicine, Microbiology, Medicine, Surgery, and Yoga, etc.

Module-II: Scientific Traditions and Technological Innovations in Indian Knowledge Systems

a. **Foundation concept for Science & Technology (7 hours)**

Linguistics & Phonetics in Sanskrit (panini's), Computational concepts in Astadhyayi Importance of Verbs, Role of Sanskrit in Natural Language Processing, Number System and Units of Measurement, concept of zero and its importance, Large numbers & their representation, Place Value of Numerals, Decimal System, Measurements for time, distance and weight, Unique approaches to represent numbers (Bhūta Saṃkhya System, Kaṭapayādi System), Pingala and the Binary system, Knowledge Pyramid, Prameya – A Vaiśeṣikan approach to physical reality, constituents of the physical reality, Pramāṇa, Saṃśaya.

b. **Indian Science & Technology in IKS (8 hours)**

Pre-Harappan and Sindhu Valley Civilization, Laboratory and Apparatus, Juices, Dyes, Paints and Cements, Glass and Pottery, Engineering Science and Technology in the Vedic Age and Post-Vedic Records. Indian Science and Technology Heritage, sixty-four art forms and occupational skills (64 Kalas). Metals and Metalworking technology: Copper, Gold, Zinc, Mercury, Lead, Silver, Iron & Steel. Dyes and Painting Technology, Town & Planning Architecture in India, Temple Architecture, Vastu Sastra.

MNFM206T :MECHANICAL ENGINEERING LAB-I (FLUID)
(1 Credit– 30 hours) (L-T-P: 0-0-2)

Objective:

To provide practical understanding of fluid mechanics concepts through experiments. It includes the study of fluid pressure distribution, verification of Bernoulli's theorem, and analysis of the performance of hydraulic machines. The focus is on hands-on experience in fluid flow measurement and equipment testing.

List of Experiments:

1. Determination of metacentric height.
2. Study of fluid pressure distribution on immersed bodies.
3. Experimental verification of Bernoulli's theorem.
4. Study of discharge through orifice meter or venturimeter.
5. Study of discharge through Triangular and Rectangular notches.
6. Determination of vorticity of free and forced vortex.
8. Determination of velocity through Pitot tube.
9. Determination of performance of Pelton Wheel
10. Determination of performance of Francis turbine.
11. Determination of performance of Reciprocating pump
12. Determination of performance of Centrifugal pump

Course Outcomes:

After completing the course successfully the students will be able to-

CO1: Comprehend the fundamental principles of fluid mechanics, including metacentric height, pressure distribution, and Bernoulli's theorem through experimental demonstrations.(Understanding)

CO2: Apply the concepts of fluid dynamics and statics to perform experiments on fluid flow measurement, including discharge determination through orifice meter, venturimeter, and notches.(Applying)

CO3: Analyze the performance characteristics of different hydraulic machines and fluid systems, such as Pelton wheel, Francis turbine, and pumps, notches based on the data obtained from experiments.(Analyzing)

CO4: Evaluate performance characteristics of fluid systems by assessing the experimental results.(Evaluating)

**MNMD202P : MACHINE DRAWING LAB
(1 credits) (L-T-P: 0-0-2)****Objectives:**

1. To develop basic understanding of projections and sectional views of various mechanical parts.
2. To get an idea about the assembly drawing of machines.

List of Experiments:**(I) Orthographic projections and Perspective projections**

1. Principle of projections.
2. First and third angle projections.
3. Orthographic projections in first and third angle.
4. Perspective projections.

(II) Sectional views

1. Introduction and types of sectional views

2. Full section
3. Half section
4. Full and half sectional views of different machine parts.

(III) Assembly drawings

1. Procedure and types of assembly drawings.
2. Assembly drawings of machine units like stuffing box, connecting rod, foot step bearing, tool-post, flanged coupling etc.

Course Outcomes:

At the end of the course students will be able to:

CO 1: Explain the concepts of different types of projections. (Explaining)

CO 2: Identify the full and half sectional views of machine parts based on requirements. (Applying)

CO 3: Construct different types of assembly drawings of machine units based on their uses. (Creating)

Applied Thermodynamics

(4 Credits-60 hours)(L-T-P: 3-1-0)

Objectives: To understand and analyze thermodynamic cycles, including Rankine, Carnot, and refrigeration cycles, steam turbine, nozzle, compressors, study the behaviour of isentropic flow and shock properties, and explore combustion processes, fuel characteristics, and energy efficiency in fluid and power systems.

Module I (12 hours)

Simple Steam Power Cycle, Rankine Cycle, Actual Vapour Cycle Processes, Comparison of Rankine and Carnot Cycles, Mean Temperature of Heat Addition, Reheat Cycle, Regeneration- Open Feedwater Heater, Reheat-Regenerative Cycle, Characteristics of an Ideal Working Fluid, Binary Vapour Cycles.

Module II (12 hours)

Reversed Carnot Cycle, Unit of Refrigeration, Limitation of Reversed Carnot Cycle, Gas Refrigeration Cycle, Vapor compression refrigeration cycles, p-h diagram. Properties of Atmospheric Air, Psychrometric Properties of Air, Psychrometric Chart.

Module III (12 hours)

a) Velocity of Pressure Pulse in Fluid, Stagnation properties, Mach Number, Property Relations for Isentropic Flow through a Duct, One Dimensional Steady Isentropic Flow, Critical Properties- Choking in Isentropic Flow, Normal Shocks, use of ideal gas tables for isentropic flow and normal shock flow, Flow through Actual Nozzles and Diffusers, Effect of Irreversibility on Nozzle Efficiency.

b) Introduction to Condensers, elements of steam condenser, types of steam condenser, air leakage and its effect on performance of condensers, vacuum efficiency, thermodynamic analysis of condensers

Module IV (12 hours)

a) Classification, Reciprocating Compressor Terminology, Work of Compression, Single stage Reciprocating Air Compressor, Volumetric Efficiency, Limitations of Single Stage Compression and Multistage Compression.

b) Classification of Steam Turbines, Simple Impulse Turbine, Optimum Operating Conditions from Blade-Velocity Diagram, Effect of Blade Friction on Velocity Diagram, work done on turbine blades and efficiencies of components, Compounding of Impulse Turbine, Reaction Turbine, Comparison between Impulse and Reaction Turbines, Losses in Steam Turbines.

Module V (12 hours)

Introduction to boilers, classification of boilers, description of each type of boilers, Characteristics of an Ideal Fuel, Liquid Fuel, Gaseous Fuel, Combustion, Amount of Air Required for Combustion, Air-Fuel Ratio, Air-Fuel Ratio from Analysis of Flue Gases, Heat Generated by Combustion, Standard Reference State, Enthalpy of Formation, Enthalpy of Reaction, Calorific value of Fuel.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall and describe various thermodynamic cycles, including Rankine and Carnot cycles, refrigeration cycles, and the properties of fluids used in these cycles and basic of nozzle, condenser, steam turbine compressor (Remembering)

CO2: Explain the principles behind different thermodynamic cycles, such as the Rankine cycle and the refrigeration cycle, and their limitations and applications in energy systems. (Understanding)

CO3: Calculate the performance of thermodynamic cycles, including steam and refrigeration cycles, and analyze the work and efficiency of compressors, nozzle condenser and turbines using the relevant thermodynamic principles. (Applying)

CO4: Analyze the effects of various factors, such as irreversibility in nozzles and diffusers, energy losses in turbines, and fuel combustion efficiency, on the overall performance of thermodynamic systems. (Analyzing)

Strength of Materials**(4 Credits – 60 hours) (L-T-P: 3-1-0)**

Objective: To provide foundational knowledge of stress, strain and deformation in solids, including principal stresses, shear force and bending moments in beams. It emphasizes understanding the behaviour of elastic deformation occurring in various simple geometries for different types of loading.

Module I (15 Hours)

Deformation in solids- Hooke's law, stress and strain- tension, compression and shear stresses- elastic constants and their relations- volumetric, linear and shear strains- principal stresses and principal planes- Mohr's circle, thermal stress.

Module II (15 Hours)

Beams and types transverse loading on beams, point and distributed loads. - shear force and bending moment diagrams-Types of beam supports, simply supported and overhanging beams, cantilevers, fixed and guided beams, Theory of bending of beams, bending stress distribution and neutral axis, shear stress distribution.

Module III (15 Hours)

a) Moment of inertia about an axis and polar moment of inertia, deflection of a beam using double integration method, computation of slopes and deflection in beams, Myosotis method for computing deflections and slopes, Castigliano's theorem, Maxwell reciprocity theorem.

b) Columns buckling: Calculation of critical loads using Euler's theory with different boundary conditions, Eccentric columns.

Module IV (8 Hours)

Torsion, stresses and deformation in circular and hollow shafts, stepped shafts, deflection of shafts fixed at both ends, stresses and deflection of helical springs.

Module V (7 Hours)

Axial and hoop stresses in cylinders subjected to internal pressure, deformation of thick and thin cylinders, deformation in spherical shells subjected to internal pressure, Combined thermo mechanical stress.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental principles of stress, strain, elastic constants etc. for analysing the behaviour of solids under different loading conditions. (Remembering)

CO2: Recognize various types of loads applied on machine components of simple geometry and understand the nature of internal stresses that will develop within the components. (Understanding)

CO3: Evaluate the strains and deformation that will result due to the elastic stresses developed within the materials for simple types of loading (Applying)

CO4: Analyse and design beams, shafts and hollow cylinders. (Analyzing)

MEASUREMENTS AND METROLOGY**(4 Credits – 60 hours) (L-T-P: 3-1-0)**

Objective: To understand the principles and methods of measurement, metrology, and error analysis for accurate evaluation of physical parameters and system performance. Apply advanced tools and statistical techniques for designing experiments, ensuring quality control, and enhancing precision in engineering and manufacturing processes.

Module I: (10 Hours)

Measurement Purpose and Parameters: Parameters – geometry (straightness, flatness, roundness, etc.), displacement, force, speed, torque, flow, level, pressure, temperature, acceleration, etc.; Definitions: Accuracy, precision, range, resolution, uncertainty and error sources; Regression analysis. Measurement Principles: Structure and examples of measurement systems; Calibration principles; Linear and angular measurements; Comparators; Gauge design; Interferometry.

Module II: (8 Hours)

Limits, Fit and Tolerances: Definitions; Tolerance zone and grades, Hole and shaft system, Geometric tolerances, Taylor's principle of gauging, Design of tolerances for various applications; Tolerance analysis in manufacturing and assembly; Role of metrology in Design of Manufacturing.

Module III: (10 Hours)

Mechanical Measurements and Equipment: Dimensional metrology – Vernier, micrometers, LVDT; Form metrology – form tester, surface profiler, CMM, 3D scanning; Surface metrology -optical microscopes, Laser scanning microscopes, electron microscopy (SEM/TEM), x-ray microscopy, Raman spectroscopy; Tool wear, workpiece quality and process metrology. Thermal and Flow Measurement: Measurement of temperature, thermal conductivity and diffusivity; Flow obstruction methods; Magnetic flow meters.

Module IV: (10 Hours)

Electrical Measurements and Instruments: Signal generators and analysis; Wave analyzer; Spectrum analyzer; Frequency counters – measurement errors, extending the frequency range; Transducers – types, strain gages, displacement transducers; Digital data acquisition system - interfacing transducers to electronics control and measuring system; Instrumentation amplifier; Isolation amplifier; Computer-controlled test systems.

Module V: (7 Hours)

Design of Experiments and Statistical Analysis: DOE techniques; Taguchi orthogonal arrays; Data acquisition, signal processing and conditioning; Error of a system of ideal elements; Error probability density function of a system of non-ideal elements; Error reduction techniques; Quality control and assurance in industry.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental concepts of measurement parameters, principles of metrology, calibration, error sources, and the role of limits, fits, and tolerances in manufacturing and quality assurance.(Remembering)

CO2: Explain the operation and significance of mechanical, thermal, flow, and electrical measurement systems, as well as the application of statistical techniques and design of experiments in process optimization.(Understanding)

CO3: Utilize metrological instruments and techniques such as comparators, form testers, and coordinate measuring machines to evaluate dimensions, surface characteristics, and form deviations in engineering components.(Applying)

CO4: Implement transducers, data acquisition systems, and signal processing methods to measure, analyze, and control parameters such as temperature, pressure, flow, and displacement in practical engineering systems.(Applying)

Kinematics and Theory of Machines

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective: To impart foundational knowledge of mechanisms, kinematic analysis, and design principles for cams, gears, and linkages. It aims to enable understanding of friction drives, flywheels, governors, and their applications in dynamic systems. The course emphasizes analytical and graphical methods for solving real-world kinematic and dynamic problems.

Module I : (12 hours)

Classification of mechanisms- Basic kinematic concepts and definitions- Degree of freedom, mobility- Grashof's law, Kinematic inversions of four bar chain, slider crank chain and double slider crank chains, Limit positions- Transmission angle- Description of some common mechanisms- Quick return mechanism, straight line generators- Universal Joint- steering gear mechanism, equation of correct steering, intermittent motion mechanism- geneva wheel, paul and ratchet mechanism.

Module II : (12 hours)

Importance of Velocity and acceleration analysis of mechanisms; Graphical methods of velocity analysis using instantaneous center method and relative velocity methods, Concept of Configuration diagram; instantaneous center of rotation: their use in velocity analysis, their location; Aronhold-Keneddy's theorem, velocity and acceleration analysis of four bar mechanism, slider-crank mechanism, quick return motion mechanism, kinematic analysis of simple mechanisms etc; Coriolis component of acceleration- introduction to linkage synthesis..

Module III : (12 hours)

Classification of cams and followers- Terminology and definitions- Displacement, velocity and acceleration diagrams: Uniform velocity, simple harmonic motion, uniform acceleration and retardation and cycloidal

motions- derivatives of follower motions- inline and offset cam and follower; specified contour cams- circular and tangent cams- pressure angle and undercutting, sizing of cams, disc cam profile design for roller/knife edge/flat face followers.

Module IV: (10 hours)

Gear drive: fundamentals and working, classification; Gear teeth nomenclature and gear parameters; , fundamental law of gearing and conjugate action, Involute and cycloidal gear teeth profiles; spur gear contact ratio and interference/undercutting; minimum number of teeth to avoid interference- helical, bevel, worm, rack and pinion gears; Gear train: classification, fundamentals and epicyclic and regular gear train kinematics.

Module V: (14 hours)

- Introduction to belt drive, types; law of belting, open and cross belting, velocity ratio, slip and creep, crowning of pulley, belt design for specific power transmission.
- Introduction to flywheel, turning moment diagram, fluctuation of energy and speed, coefficient of fluctuation of energy and speed.
- Introduction to governors and their working: Watt, Porter, Proell, Hartnell, Hartung and Wilson-Hartnell governors.

After completing the course successfully the students will be able to-

CO1: Recall the classifications, definitions, and fundamental laws related to machine and mechanisms; examine the degree of freedom of a given mechanism; state law of gearing, law of belting; list different types of cam & follower classify various types of gears and gear trains; state the working of governors, flywheels (Remembering)

CO2: Explain the principles of motion analysis, gear kinematics, cam design, and dynamic elements such as governors and flywheels in mechanical systems.(Understanding)

CO3: Solve problems related to gear or gear train, flywheel, governor and belt drives for practical applications.(Applying)

CO4: Design suitable cam profile with roller/knife-edge/flat faced follower for simple applications and Construct velocity and/or acceleration analysis diagrams of simple mechanisms. (Analysing)

Production and Operation Management

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective: To provide students with a comprehensive understanding of production and operations management, focusing on improving workplace efficiency through work study and ergonomics, optimizing factory management with effective location and layout planning, enhancing product development and design strategies, streamlining production planning and control processes, and applying project management techniques such as PERT and CPM.

Module I: Work Study and Ergonomics (10 hours)

Introduction to work study, Scope of Work study, Motion/Method study and Work measurement. Therbligs, use of motion camera in micro motion study, SIMO chart. Motion economy: Meaning, Principles related to (i) Workplace layout (ii) Design of tools and equipment and (iii) Use of human body. Ergonomics (Human factors engineering): Meaning, Characteristics (Cognitive ergonomics and Physical ergonomics), Introduction ONLY to Anthropometry, Biomechanics and Musculoskeletal Disorders (MSD) Preventive measures by ergonomic designs. Work measurement: Meaning, Methods such as (i) Stopwatch time study (ii) Work sampling (iii) Normal time, Rating factor (RF), allowances and determination of Standard Time.

Module II: Factory Management (13 hours)

Meaning of plant location, factors affecting location decisions, location theory, Qualitative models and semi quantitative models: Brown and Gibbs model, Break-Even analysis model, single facility location problems and multi-facility location problems. Meaning of plant/facility layout, factors influencing plant layout, objections of good facility layout, Types of plant layout; Systematic Layout Planning (SLP), Group Technology (GT), Flexible Manufacturing Systems (FMS) and flexible layout and Computer integrated manufacturing (CIM). Line balancing: objectives, solution of Assembly Line Balancing (ALB) problems by: Largest Candidate Rule and RPW methods. Objectives of quality control. Meaning of Total Quality and Total quality management (TQM) Statistical quality control: Meaning and tools; Reliability assessment of processes, Block chain, Energy management, Efficiency & throughput, Overall equipment effectiveness. Process capability, lean manufacturing.

Module III: Product development and Design (7 hours)

Meaning of product, product life cycle (PLC) and product mix. Decision to be taken during product development and design. Procedure for product development and design. Value of a product: its meaning, Value analysis: its objectives, procedure: Simplification and Standardization.

Module IV: Production planning and control (15 hours)

Meaning and objectives of production planning and control. Function of production planning and control, various steps in production planning and control (PPC), Forecasting – its meaning and scope, Qualitative and quantitative methods of forecasting and their scope in engineering industries. Introduction to MRP and MRP II, evolution from Materials Requirement Planning (MRP) to Manufacturing Resource Planning (MRP II). Enterprise resource planning (ERP). Inventory Management: Meaning of inventory, Necessity for maintaining inventory, Inventory classification, Meaning of inventory control, Costs associated with inventory system, Analysis of deterministic inventory model, Just in Time (JIT) and Kanban systems. Meaning of quality.

Module V: Project management (15 hours)

Meaning of project management and its objectives, Network development technique (Arrow diagram and AON diagram) for determination of critical path (CP), earliest and latest dates/times. PERT model: characteristics, probability density function used for PERT activities, probability density function used for the CP, Calculation of Expected length of CP and its standard deviation, calculation of probability of completion of a PERT project (iii) CPM model: characteristics, difference with PERT, direct and indirect costs, concept of crashing (cost time trade off). Project closure: acceptance of project deliverable; Analytics: Performance, capability aggregation, cost benefit analysis, variability analysis, Output-outcome analysis, project documentation, best practices, and depository.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental concepts of work study, ergonomics, factory management, production planning, product design, and project management, including associated tools and methodologies. (Remembering)

CO2: Explain the principles of motion study, plant layout, product development, inventory management, and project planning techniques such as PERT and CPM, along with their applications in industrial settings. (Understanding)

CO3: apply work study techniques, line balancing methods, and forecasting models to optimize production processes, manage inventory, and improve overall system efficiency. (Applying)

CO4: Evaluate production systems, analyze plant layouts, perform critical path assessments in project management, and assess process reliability using statistical tools for decision-making and optimization. (Analyzing)

Engineering Materials and Applications

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objectives: To provide foundational knowledge of materials science, including crystal structures, mechanical properties, and phase diagrams. It aims to explore the properties, applications, and heat treatment of metals, alloys, polymers, ceramics, and composites. Additionally, it introduces advanced materials and their electrical, magnetic, and smart material applications.

Module I Engineering Materials and Classification (10 hours)

Metals, plastics, ceramics and composites; Relevant properties (physical, mechanical, thermal, electrical, chemical), cost; Range of applications; Material designation and standards; Ashby diagrams; Selection criteria and process.

Module II Mechanical Properties and Testing (10 hours)

Tensile, compression, torsion, fatigue, fracture and wear tests; Young's modulus; Relations between true and engineering stress-strain curves; Generalized Hooke's law; Yielding and yield strength; ductility, resilience, toughness and elastic recovery; Hardness measurement their relation to strength; SN curve, endurance and fatigue limits; Introduction to non-destructive testing (NDT).

Module III Metal and Alloys (10 hours)

Iron and steel; Stainless steel and tool steels; Copper & its alloys – brass, bronze & cupro-nickel; Aluminium & Al-Cu-Mg alloys; Nickel based superalloys & Titanium alloys; Phase diagrams and interpretation of microstructure; Iron Iron-carbide phase diagram and cooling (TTT) diagrams.

Module IV Heat Treatment (10 hours)

Heat treatment of Steel; Annealing, tempering, normalizing, spheroidising, austempering, martempering, case hardening, carburizing, nitriding, cyaniding, carbo-nitriding, flame and induction hardening, vacuum and plasma hardening

Module V Polymers, Ceramics and Composites (10 hours)

Polymers – Classification and applications; Polymerization techniques; Ceramics – Oxide ceramics, ceramic insulators, bio-ceramics and Glasses; Composites – Reinforcement, matrix, metal matrix composites, ceramic composites, polymer composites; Other advanced materials – biomaterials, optical materials, high temperature materials, energy materials, and nanomaterials.

Module VI Electrical and Magnetic Materials(10 hours)

Conducting and resisting materials – types, properties and applications; Semiconducting materials – properties and applications; Magnetic materials – Soft and hard magnetic materials and applications; Superconductors and dielectric materials – properties and applications; Smart materials; Sensors and actuators; Piezoelectric, magnetostrictive and electrostrictive materials.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental concepts of crystal structures, defects, mechanical properties, and the classification of materials such as metals, ceramics, polymers, and composites.(Remembering)

CO2: Explain the microstructural evolution during phase transformations, heat treatment processes, and the relationships between material properties and their applications.(Understanding)

CO3: Analyze mechanical property measurements and phase diagrams to predict material behaviour under various loading and environmental conditions.(Applying)

CO4: Apply knowledge of advanced materials and their properties in designing solutions for engineering applications, including smart materials, biomaterials, and energy-efficient (Applying)

Mechanical Engineering Lab II: Materials Lab**(1 Credits) (L-T-P: 0-0-2)****Objectives:**

To provide an understanding of various manufacturing processes.

To get an idea of the dimensional and form accuracy of products.

List of Experiments:

1. Use of slip gauges and sine bar.
2. To study the Brinell hardness testing machine and perform the Brinell hardness test.
3. To study the Rockwell hardness testing machine and perform the Rockwell hardness test.
4. To study the Vickers hardness testing machine and perform the Vickers hardness test.
5. Comparative study of microstructures of different given specimens (mild steel, gray C.I., brass, copper etc.)
6. To study the Impact testing machine and perform the Izod Impact tests.
7. To study the Impact testing machine and perform the Charpy Impact tests.
8. To study the Universal testing machine and perform the tensile test.
9. Use of Vernier caliper and height gauge.
10. Use of micrometer, depth gauge.

**Introduction to AutoCAD
(NC– 30 hours) (L-T-P: 1-0-2)**

Objective: To learn the basics of technical drawing thoroughly by using AUTOCAD software.

Module 1: (8 hours)

Interface of AutoCAD, Cartesian coordinate system: absolute coordinate system, relative coordinate system, AutoCAD

basics: Function keys, Draw Commands, Modify commands, Annotate dimension style manager, Single line text, Multiline

text, Layer properties, Insert blocks, Parametric, Isometric views

Module 2: (8 hours)

Isometric and Perspective projections, Isometric diagram's exercise, 2D Fundamentals in Auto CAD, Drawing units.

Interactive Input method: grid snap mode, introduction to 3d interface of Auto CAD.

Module 3: (8 hours)

a) Mechanical diagrams: nut and bolt, rivets, types of threads, keys, knuckle joint, Idler plate, Hook Joint, mechanical tools etc.

b) Civil engineering drawing: Brief history of building drawing Introduction to building drawing, simple building drawing plan.

c) Electrical and Electronic drawings: Circuit, transistor symbols, electrical plans etc.

Module 4: (6 hours) Group Assignment/ Activity**Course Outcomes**

After completing the course successfully the students will be able to-

CO1: Demonstrate an understanding of AutoCAD's interface, coordinate systems, basic drawing and modification tools, and their application in creating 2D and isometric views for mechanical engineering designs. (Understanding)

CO2: Apply knowledge of AutoCAD to construct 2D and isometric projections, mechanical diagrams (e.g., nuts, bolts, rivets, and threads) and electrical/electronic circuit diagrams using appropriate tools and techniques. (Applying)

CO3: Create detailed and accurate technical drawings and designs, including mechanical components and electrical schematics, utilizing advanced AutoCAD features. (Creating)

Heat Transfer

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective: To provide comprehensive knowledge of heat transfer mechanisms, including conduction, convection, radiation, and phase change processes, alongside practical applications like fins and heat exchangers, and to introduce mass transfer concepts-

Module I: Conduction (15 hours)

Introduction to three modes of heat transfer, Derivation of heat balance equation- Steady one dimensional solution for conduction heat transfer in Cartesian, cylindrical and spherical geometry, concept of conduction and film resistances, critical insulation thickness, lumped system approximation and Biot number, Fins,

Mathematical Equation of a Rectangular Fin of Uniform Cross section, Temperature and Heat Transfer Calculation of Fin with different boundary Conditions, Fin Efficiency and Fin Effectiveness.

Module II: Convection (20 hours)

- Heat convection, Mechanism of Convection, Concept of Velocity, and Thermal Boundary Layer, Laminar and Turbulent Flow, Forced and Free Convection, Dimensionless parameters for forced and free convection heat transfer, Governing Equations for Boundary Layers.
- Forced Convection: Flat Plate in Parallel Flow, Integral Method: Laminar Forced Convection on a Flat Plate, Turbulent Boundary Layer Condition for Flow over an Isothermal Flat Plate, Methodology for Calculation of Convection Coefficient, Analogy Between Heat and Momentum Transfer. Internal Flow: Hydrodynamic and Thermal Considerations, Laminar Flow Heat Transfer in a Circular Pipe: Fully Developed Flow, Turbulent Flow Convection in Pipes: Empirical Correlations, Heat Transfer Considerations: Constant Wall Temperature and Constant Heat Flux.
- Natural Convection: Analytical Solution of Laminar Free Convection over a Vertical Flat Plate, Integral Method for Natural Convection Heat Transfer on a Vertical Flat Plate, Correlation from Experimental Results.

Module III: Radiation (10 hours)

Fundamentals of Thermal Radiation, Absorptivity, Reflectivity and Transmissivity, Emissivity, Emissive Power, Spectral Energy Distribution of a Black Body, Stefan-Boltzmann Law, Planck's Law, Kirchhoff's Law, Intensity of Radiation, Calculation of radiation heat transfer between surfaces using radiative properties, Shape Factor, Electrical Analogy, Evaluation of Shape Factor, Radiation Heat Transfer Between Gray Bodies, Radiosity and Irradiation, Radiation Shields.

Module IV: Heat Exchanger, Phase Change and Mass Transfer (15 hours)

Types of heat exchangers, Compact, Shell and Tube and Plate Heat Exchangers, Overall Heat Transfer Coefficient, Fouling Factor, Use of LMTD, Cross Flow Heat Exchanger, Effectiveness-NTU Method, Heat Exchange Design Considerations. Condensation Heat Transfer, Dropwise Condensation, Laminar Film Condensation on a Vertical Plate, Boiling Heat Transfer, Regimes of Boiling, Nucleate Boiling, Correlations of Boiling Heat Transfer Data. Introduction to mass transfer, Diffusion Mass Transfer, Fick's law of Diffusion, Analogy between Momentum, Heat and Mass Transfer.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Explain the principles of conduction, convection, radiation, phase change, and mass transfer, including governing laws and boundary conditions. (Understanding)

CO2: Solve heat transfer problems in fins, extended surfaces, and thermal systems using analytical methods and empirical correlations. (Applying)

CO3: Analyze radiation heat exchange between surfaces using shape factors, electrical analogies, and evaluate performance of fins/radiation shields. (Analyzing)

CO4: Design and optimize heat exchangers using LMTD/NTU methods, and assess boiling/condensation processes using relevant correlations. (Evaluating)

DESIGN OF MACHINE ELEMENTS
(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective: To apply the principles of mechanical design, including static and dynamic loading, stress analysis, and failure theories, to design machine components such as shafts, springs, bearings, and gears, ensuring safety, durability, and performance optimization using industry standards and methodologies.

Module I: Design against Static Load (15 hours)

Overview and need of design, Design procedures, Limits, Fits and Tolerances, BIS standards. Design against Static Loading: Modes of failure, Factor of safety, Stress-strain, Design of cotter and knuckle joints, Theories of failure: Maximum normal-stress theory, Maximum shear-stress theory and Distortion-energy theory.

Module II: Design against Dynamic Load (15 hours)

Stress concentration, Modes of failure, Fluctuating stresses, Fatigue failure and S-N diagram, Notch sensitivity, Soderberg, Goodman and Gerber diagrams, modified Goodman diagrams, Fatigue design under combined stresses.

Module III: Design of shafts and springs (10 hours)

- a. Shafts: Design of shaft subjected static and dynamic loading against failure due to bending, torsion and combined bending and torsion.
- b. Springs: Design of helical tension and compression springs, leaf springs and helical torsion springs, surge in spring

Module IV: Design of bearings and gears (20 hours)

- a. Bearings: Design of rolling contact bearings, Static and dynamic load carrying capacity, Load life relationship, Analysis and design of sliding contact bearings, Reynold's equation.
- b. Gears: Design of spur gears, force analysis, beam strength and wear strength of spur gear tooth, design of helical gears, virtual teeth and tooth proportions, force analysis and effective load, design of bevel gears, design of worm gears, strength and wear rating of worm gears.

Course Outcomes:

After completing the course successfully the students will be able to-

CO1: Recall and define key principles of mechanical design, including static and dynamic loading, stress analysis, failure theories, and BIS standards, along with the characteristics and applications of shafts, springs, bearings, and gears. (Remembering)

CO2: Explain the modes of failure, stress-strain relationships, fatigue phenomena, and the working principles of machine elements such as joints, shafts, springs, gears, and bearings under various loading conditions.(Understanding)

CO3: Apply design methodologies and failure theories to calculate dimensions, analyze stress distribution, and ensure the safe and functional design of machine components like shafts, springs, and gears under static and dynamic loads.(Applying)

CO4: Examine and evaluate the stress distribution, failure modes, and performance of machine components such as shafts, springs, gears, and bearings under varying loading conditions to identify critical factors influencing their design and functionality.(Analyzing)

CO5: Critically assess the suitability and performance of designed machine components, considering factors such as safety, efficiency, reliability, and adherence to industry standards.(Evaluating)

Manufacturing Processes

(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective: To understand traditional and advanced manufacturing techniques, including casting, forming, machining, additive manufacturing, and joining processes, emphasizing their interdependencies, design for manufacturability, material behavior, tool performance, and modern industrial applications to optimize product quality and production efficiency.

Module I: (6 Hours)

Manufacturing Processes and Classification: Additive, subtractive and shaping processes; Relative advantages and limitations; Inter-dependency of geometry, material and process; Effect on product quality and cost; Part design for manufacturability; Process selection criteria.

Module II: (15 Hours)

Material Shaping Processes: Metal casting (sand, die and investment casting), Heat transfer and solidification, shrinkage, riser design, casting defects and residual stresses, Bulk forming (forging, rolling, extrusion, drawing) and sheet forming (shearing, deep drawing, bending); Thermoplastic and thermoset plastic processes (ex. injection and blow molding); Powder metallurgy; Metal injection molding

Module III: (12 Hours)

(a) Metal cutting: Single and multi-point cutting; Orthogonal cutting, various force components, Chip formation, Tool wear and tool life, Surface finish and integrity, Machinability, Cutting tool materials, Cutting fluids

(b) Material Removal Processes: Turning, Drilling, Milling and finishing processes, Introduction to CNC machining.

Module IV: (12 Hours)

(a) Additive manufacturing: Rapid prototyping and rapid tooling, power bed fusion, material jetting, binder jetting, direct energy deposition and lamination processes.

(b) Joining and fastening processes: Physics of welding, Arc welding, gas welding, shielded metal arc welding; GMAW (MIG) and GTAW (TIG); Brazing and soldering; Solid state joining; Adhesive bonding.

Module V: (15 Hours)

Other (unconventional) Manufacturing Processes: Abrasive Jet Machining, Water Jet Machining, Abrasive Water Jet Machining, Ultrasonic Machining, principles and process parameters, Electrical Discharge Machining, principle and processes parameters, MRR, surface finish, tool wear, dielectric, power, wire EDM; Electro-chemical machining (ECM), process parameters, MRR and surface finish, Laser Beam Machining (LBM), Plasma Arc Machining (PAM) and Electron Beam Machining; Micro and nano manufacturing.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall and define fundamental concepts of manufacturing processes, including additive, subtractive, and shaping methods, as well as key principles of casting, forming, machining, and joining techniques. (Remembering)

CO2: Explain the interdependence of geometry, materials, and processes in manufacturing, and describe the influence of these factors on product quality, cost, and design for manufacturability. (Understanding)

CO3: Apply knowledge of casting and forming techniques to design gating systems, risers, and forming setups, ensuring defect-free production with optimal material utilization. (Applying)

CO4: Implement machining and additive manufacturing principles to select tools, determine process parameters, and optimize material removal rates for enhanced efficiency and product accuracy. (Applying)

Mechatronics, Robotics & Control (4 Credits – 60 hours) (L-T-P: 3-1-0)

Objectives: This course introduces the modeling and analysis of mechatronic systems for engineering applications, equipping students with the skills to design and evaluate integrated systems. Students will learn to identify and select appropriate sensors, transducers, and actuators for monitoring and controlling processes or products. The course also covers the development of Programmable Logic Controller (PLC) programs tailored to engineering applications. Additionally, students will gain expertise in evaluating the performance of mechatronic systems, enabling them to optimize and innovate in real-world engineering scenarios.

Contents

Module I: Introduction: Electro-mechanical systems; Typical applications; Examples – automobiles, home appliances, medical instruments, etc.

Module II: Sensors: Transduction principles; Sensitivity, accuracy, range, resolution, noise sources; Sensors for common engineering measurements – proximity, force, velocity, temperature, etc.; Signal processing and conditioning; Selection of sensors.

Module III: Actuators: Pneumatic and hydraulic actuators; Electric motors including DC, AC, BLDC, servo and stepper motors; Solenoids and relays; Active materials – piezoelectric and shape memory alloys.

Module IV: Machine Controls: Microprocessors and their architecture; Memory and peripheral interfacing; Programming; Microcontrollers; Programmable Logic Controllers; PLC principle and operation; Analog and digital input/output modules; Memory module; Timers, internal relays, counters and data handling; Industrial automation systems; Basic PLC programming; Industry kits (Arduino, Raspberry Pi, etc.).

Module V: Robotics: Robot configurations: serial and parallel; Denavit–Hartenberg parameters; Manipulators kinematics; Rotation matrix, Homogenous transformation matrix; Direct and inverse Kinematics for robot position and orientation; Workspace estimation and path planning; Robot vision; Motion tracking; Robot programming and control; Industrial robots - Pick and place robots, sorting, assembly, welding, inspection, etc.

Module VI: Control Theory and Systems: Basic control concepts; Feedback; Open and closed loop control; Concept of block diagrams; P, PI and PID controllers; Tuning the gain of controllers; System models, transfer functions, system response, frequency response; Root Locus method and Bode plots.

Module VII: Computational Tools: Demonstration and projects using simulation software (e.g., Matlab, Scilab, ROBODK) for control systems and robotics.

Course Outcomes:

At the end of this course students will demonstrate the ability to -

1. Explain the principles and applications of sensors and actuators in electro-mechanical systems used in automobiles and medical instruments. (Understand)
2. Apply the principles of microcontrollers and PLCs to program basic control sequences for industrial automation systems using Arduino or Raspberry Pi kits. (Apply)
3. Analyze the kinematics of robotic manipulators using Denavit-Hartenberg parameters and homogeneous transformation matrices to determine position and orientation. (Analyze)
4. Evaluate the performance of PID controllers in electro-mechanical systems using simulation tools like MATLAB to optimize system response and stability. (Evaluate)

ECONOMICS FOR ENGINEERS (3 credits-45 hours)(L-T-P: 3-0-0)

Objective: The objective of this course is to make the students of engineering aware of the basic concepts in Economics, introduce them to the preliminary techniques of quantitative analysis in Economics and finally to certain relevant concepts of the stock market. The purpose of this course is to increase the all-round knowledge of the engineer and enhance his/her professional competence in the work field.

Module I (15 hours)

- a) Definition of Economics: Subject matter, scope, principal division of Economics – Microeconomics and Macroeconomics.
- b) Theory of Demand: Meaning of Demand and Supply, The law of demand, meaning of utility, marginal utility and total utility, law of diminishing marginal utility, Indifference curve approach, Consumer's Equilibrium, elasticity of demand- determinants, types and measurement, exceptions to the law of demand.

- c) Theory of Production: Meaning of Production function, production function with one variable input – Law of Variable Proportions, production function with two variable inputs – Law of Returns to Scale, Cobb-Douglas production function. Economic concept of cost- short-run and long-run.
- d) Market Structure: Market Classification- perfect competition, monopoly, monopolistic competition. Concepts of Revenue - Average Revenue, Marginal Revenue and Total Revenue. The firm- objectives and constraints, Equilibrium of the firm- TR-TC approach, MR-MC approach.

Module II (10 hours)

- a) Macroeconomic concepts and aggregates: Circular flow of income, National Income- GDP, GNP, Meaning and relation between: consumption, saving, investment. Aggregate demand and aggregate supply - Saving and Investment functions, Multiplier Mechanism.
- b) Money: Definition of money, functions of money, Money Supply- M1M2M3M4, Inflation- meaning, types, control of inflation- monetary policy, fiscal policy.
- c) Banking: Central Banks, Commercial Banks, creation of credit.
- d) Trade Cycles: Meaning of Trade Cycle, Various phases of Trade Cycle.
- e) International Trade: Balance of Payments, Devaluation, Exchange Rate, Special Drawing Rights (SDR), IMF, WTO, concept of Globalization, Role of MNCs, Regional Economic Integration.

Module III (10 hours)

- a) Quantitative Analysis in Economics: Profit Maximization problems, break-even analysis, demand estimation.
- b) Introduction to Statistics: Data, diagram, Data Interpretation problems, Measures of Central Tendency, Measures of Dispersion, dispersion, Index numbers.

Module IV (10 hours)

- a) Introduction to Stock Market: Stock Markets - Meaning, NSE, BSE, NYSE, Stock Market Indices - SENSEX, NIFTY, DOW. Bull Market and Bear Market, Role of SEBI in stock market, FDIs and FII, Role of FII in stock market.
- b) Basic terms related to stock market: Shares, equity shares, bonus shares, preference shares, buyback shares, splitting of shares, trading - intraday trading, commodity trading, futures, hedging, arbitrage.
- c) Mutual Funds: Meaning of Mutual funds, Types of Mutual Fund.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental concepts of economics, including theories of demand and production, market structures, macroeconomic aggregates, and key financial terms related to stock (Remembering)

CO2: Explain the principles of demand, production, and market structures, along with macroeconomic concepts such as national income, inflation, and trade cycles, and their impact on economic systems.(Understanding)

CO3: Apply quantitative methods such as break-even analysis, demand estimation, and statistical measures to solve economic and business-related problems.(Applying)

CO4: Utilize knowledge of stock market operations, financial instruments, and mutual funds to interpret market trends and make informed investment decisions (Applying)

**Mechanical Engineering Lab-III: Thermal
(1 Credits) (L-T-P: 0-0-2)**

Objective: To introduce the student the fundamental theories and laws along with the industrial applications of thermodynamics and heat transfer.

List of Experiments:

1. Determination of dryness fraction of combined separating and throttling calorimeter.
2. Determination of Coefficient of Performance of Vapour Compression Refrigeration System.
3. Study and Performance test of Single Acting Reciprocating Air Compressor.
4. Determination of Thermal Conductivity of Metal Rod and Composite Wall
5. Determination of Heat Transfer Coefficient in Natural Convection and Forced Convection.
6. Determination of Temperature Distribution and Fin Efficiency in both Natural and Forced Convection.
7. Determination of Stefan Boltzmann Constant.
8. Determination of LMTD of both parallel flow and counter flow heat exchanger.
9. Study and Performance test on a Petrol Engine.
10. Study and Performance test on a Diesel Engine.

**Mechanical Engineering Lab-IV: Design -1
(1 Credits) (L-T-P: 0-0-2)**

Objectives:

- (i) To understand the measurement of mechanical properties of materials
 - (ii) To understand the deformation behaviour of materials
 - (iii) To understand the kinematic and dynamic characteristics of mechanical devices
- Contents

List of Experiments:

1. **Determination of Coefficient of Friction between two given surfaces.**
2. **Determination of Moment of Inertia of the Fly Wheel.**
3. **Verification of Triangle Law and Polygon Law of Forces.**
4. **Determination of efficiency of Screw Jack.**
5. **Worm and Worm wheel experiment**
6. **To verify the law of moment of force and to determine the Bending Moment for a simply supported beam.**
7. **Study of gyroscope and gyroscopic effect/couple.**
8. **Study of different types of brakes and dynamometers.**

**QUANTITATIVE APTITUDE FOR COMPETITIVE EXAMINATION
(NC– 30 hours) (L-T-P: 1-0-2)**

Objective:

This course is aimed to provide the learners a platform to have an insight about the various quantitative aptitude Problems

Module I: (15 hours)

Simplification, HCF and LCM, Ratio and Proportion, Percentage, Partnership, Average, Profit and Losses, Areas and Volumes, Simple Interest and Compound Interest.

Module II: (15hours)

Time and work, Time and distance, Problems on ages, Pipes and cisterns, Boats and streams, Visualization of space, Probability.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Solve different numerical problem related to quantitative aptitude.(Applying)

Machine Design and Dynamics
(4 credits-60 hours)(L-T-P:3-1-0)

Objectives: This course seeks to provide an introduction to the design of machine elements and introduction to dynamics of machinery, students will learn various design aspects of components like screws, couplings, belt, chain, flywheel etc. and the applicability of available design data during designing. The course involves introduction to gyroscope and governor and aims at developing skills to understand the dynamics of the mechanisms.

Module I: Design of Power Screws, Joints, Keys and Couplings (20 hours)

- a) Power Screw: Analysis and applications of power screws, forms of threads, self-locking, efficiency of screw.
- b) Threaded fasteners: ISO Metric screw threads, bolted joint analysis under eccentric load, torque required for bolt tightening.
- c) Permanent Joints: Design of Riveted and welded joints and their strength.
- d) Keys: Introduction to different types of keys, Force analysis.
- e) Couplings: Analysis and design of rigid flange couplings.

Module II: Brakes and Clutches (10 hours)

- a) Brakes: Analysis of Block, band and disc brakes.
- b) Clutches: Classification, Analysis of friction clutches

Module III: Design of Belt Drive, Chain Drive and Flywheel (15 hours)

- a) Design of belt drive: geometrical relationships, analysis, condition for maximum power, V belts.
- b) Design of chain drive: geometrical relationships, sprocket wheels, design of chain drive.
- c) Design of Flywheels: Introduction, Turning moment diagram, solid disk flywheel, rimmed flywheel.

Module IV: Balancing (8 hours)

- a) Balancing of rotational mass: Static and dynamic balancing.
- b) Balancing of reciprocating mass: Partial balancing, Different balancing approaches.

Module V: Governors and Gyroscope (7 hours)

- a) Governor: Introduction, types, principle, working and need.
 b) Gyroscope: Introduction, principle and application.

COURSE/LEARNING OUTCOMES

After completing the course successfully the students will be able to-

CO1: Define the basic concepts related to the design process.

CO2: Illustrate the idea of working and design of different types of brakes and clutches based on established theories.

CO3: Evaluate suitable dimensions for belt drive, chain drive and flywheel based on failure criterion.

CO4: Compute required balancing weight in machines in static and dynamic balancing cases.

CO5: Illustrate the use and working principles of governors and gyroscopes.

Manufacturing Automation
(4 Credits – 60 hours) (L-T-P: 3-1-0)

Objective:

To understand the importance of automation in the field of machine tool based manufacturing and to get the knowledge of various elements of manufacturing automation – CAD/CAM, sensors, pneumatics, hydraulics and CNC. Also it is intended to understand the basics of product design and the role of manufacturing automation.

Module I: (15 hours)

Introduction to manufacturing: types based on human participation, materials processed and quality requirement; Definition of automation; Reasons for automating; Strategies; Types of automation; five levels of automation; Automation Vs Mechanization; Current trends, CAD, CAM, CIM; Rigid automation: Part handling, Machine tools. Flexible automation: Computer control of Machine Tools and Machining Centres, CNC machines, Automated flow lines (types, selection); Work part transport and transfer mechanisms; Feedback systems and control; Automated Material handling. Assembly, Flexible fixturing; Introduction to Modelling and Simulation: Product design, process route modelling, Product Optimization techniques.

Module II: (15 hours)

DFMA: concept and implementation strategy; Computer Aided Manufacturing: Numerical control (NC, CNC, DNC); Introduction to CNC part programming and computer-aided process planning, G code/M codes; absolute vs incremental coordinate system, CNC technology, PLC, Microcontrollers, CNC Adaptive Control; online and offline monitoring of tool.

Module III: (15 hours)

Automation Tools and Techniques: Mechanical, electro-mechanical, pneumatic and hydraulic systems; Sensors integration; Process monitoring, data analysis and control using actuators; Robots (pick, place, assembly, welding, painting, etc.); Automatic Guided Vehicles; Automated inspection and measurement (CMM and 3D Scanning); Machine vision, AI and machine learning; Human-machine interfaces; Examples and case studies.

Module IV: (15 hours)

Advanced Automation Trends: Digital, inclusive, smart and distributed manufacturing; Industry 4.0; Digital transformations in shop-floors (CIM to Smart factory; Intelligent machines to Smart Machines; Factory automation to Distributed automation; Human sense to system sensed); Orientation of parts: in-bowl and out-of-bowl tooling; Manufacturing equipment embedded with digital data and driven by adoptive controls; Manufacturing automation with autonomous decisions taken by computers based on the realistic process/machines (production conditions) data acquired from the resources.

Course Outcomes

After completing the course successfully the students will be able to-

1. Recall and understand the concept of and identify automated system, various tools and techniques used for automation, know the working of various parts of an automated system
2. Synthesize CNC part program using G/M codes for a given product geometry under specified conditions
3. understand the key CNC technologies and their implementation for specific tasks, uses of robotics in manufacturing automation for specific tasks.
4. Analyze the Product design process, modelling and simulation; know the advanced trends in automation; Industry 4.0 and smart manufacturing

Product Innovation and Entrepreneurship (3 credits-45 hours)(L-T-P: 3-0-0)

Objectives: To expose aspiring student entrepreneurs to various elements of a technology venture starting from market need identification to innovative solution development and its commercialization through business planning and start-up company incubation.

Module 1: Entrepreneurship: Role of entrepreneurship in economic development; Entrepreneurial mindset, motivation and competencies; Market pull and technology push factors; New product development lifecycle; Technology readiness levels; Product-market fit validation; Commercialization pathways; Business vision & leadership; Team composition & management.

Module 2: Product Innovation: Opportunity scanning, market survey, need identification and problem definition; Creative design thinking for concept generation; Detailed design & prototyping; Functionality & manufacturability; Bill of materials & components supply chain; Manufacturing & assembly plan; Product testing & quality assurance; Intellectual property rights management.

Module 3: Marketing & Finance: Market segmentation & market sizing; Customer persona & value proposition; Marketing (Go-to-market) strategy; Distribution channels and sales network; Funding requirement (based on stage); Source of funding for startup ventures; Financial projections and accounting; Startup to scale up financing.

Module 4: Venture Creation: Sustainable business options & pathways; Business model & business canvas; Startup team & business partners; Startup ecosystem and stakeholders; Technology business incubators & parks; Proposal pitching & agreements; Startup company incorporation; Social impact & responsibility.

Course Outcomes:

At the end of this course students will demonstrate the ability to

1. Understand how to identify an unmet need through market research
2. Learn how to create an innovative solution and check problem-solution fit
3. Practice business planning, including marketing, fund-raising and start-up incubation.

MECHANICAL VIBRATION

(3 credits-45 hours)(L-T-P: 3-0-0)

Objective: To impart fundamental knowledge of mechanical vibrations, enabling students to model, analyze, and solve vibration problems in engineering systems, with an emphasis on free and forced vibrations, damping, resonance, and vibration control in mechanical structures and machinery.

Module I: Introduction (15 hours)

Definition, types of vibration:- Free and Forced vibration, Damped (viscous) and Undamped vibration; degrees of freedom (DOF), beats, mathematical models, displacement, velocity and acceleration, Resonance, Whirling of shafts.

Module II: Free Vibrations (15 hours)

a) Undamped free vibration: Derivation of differential equation by equilibrium method and energy method, Newton's 2nd law method, Solutions to differential equations of single degree and 2 degree of freedom system, mode shapes.

b) Damped free vibration: Introduction, free vibration with viscous damping- overdamped, underdamped and critically damped system, logarithmic decrement, coulomb damping.

Module III: Forced Vibrations (15 hours)

a) Introduction, Response under a periodic force for first order and second order systems, resonance, vibration isolation and force transmissibility, vibration absorbers.

b) Multi degree of freedom systems: equations of motion, matrix methods, eigenvalue problems.

Course Outcomes:

After completing the course successfully the students will be able to-

CO1: Understand the fundamental concepts of mechanical vibrations, including types of vibrations, damping, resonance, and whirling of shafts. (understanding)

CO2: Develop and solve mathematical models for free and forced vibrations of single and multi-degree-of-freedom systems using analytical methods. (applying)

CO3: Analyze and evaluate vibration responses to various forcing conditions and apply vibration isolation and control techniques in practical systems. (analysing and evaluating)

Alternative NPTEL/SWAYAM Course:

NUMERICAL METHODS**(3 credits-45 hours)(L-T-P: 3-0-0)**

Objective:

Module I :(15 Hours)

Taylor Series; Roots of equations: The Bisection Method, The False Position Method, Simple Fixed Point Iteration, Newton Raphson method, Secant method. Sets of Linear algebraic equations, Gauss Elimination method, Gauss Jordan elimination method, LU Decomposition method, Gauss Seidel iteration method. Numerical Integration: Trapezoidal rule, Simpson's 1/3rd rule, Simpson's 3/8th rule, Ordinary Differential Equations: Euler's method, RungeKutta Methods.

Module II :(15 Hours)

Numerical solutions to Partial Differential Equations using Finite Difference Method (FDM): Elliptic Equations, Parabolic equations. Curve Fitting: Least Squares Regression. FDM applications in heat transfer and CFD.

Module III :(15 Hours)

Introduction to finite element method; Principle of potential energy; FE analysis of 1D element problems (spring, bar, truss elements); Development of element stiffness equation and their assembly; Plain strain and plain stress problems.

Course Outcomes

After completing the course successfully the students will be able to-

Mapping of CO with PO & PSO

COMPOSITE MATERIALS**(3 credits-45 hours) (L-T-P: 3-0-0)**

Objective:

This course on Composite Materials provides a concise overview of principles, properties, and applications in mechanical engineering. Students will analyze and design composite structures using the rule of mixtures, failure criteria, and techniques like bending, buckling, and vibration analyses. It covers laminated composite performance and manufacturing processes, equipping students to solve engineering challenges.

Module1 (15 hours)

Definition and applications of composite materials, Fibers- glass, carbon, ceramic and aramid fibers; Matrices- polymer, graphite, ceramic and metal matrices; characteristics of fibers and matrices. Lamina- assumptions, macroscopic viewpoint, generalized Hooke's law, reduction of homogeneous orthotropic lamina, isotropic limit case, orthotropic stiffness matrix, commercial material properties, rule of mixtures, transformation matrix, transformed stiffness.

Module II (18 hours)

Manufacturing of composite materials, bag moulding, compression moulding, pultrusion, filament welding, other manufacturing processes. Basic assumptions of laminated anisotropic plates, symmetric laminates, angle ply laminates, cross ply laminates, laminate structural moduli, evaluation of lamina properties, determination of lamina stresses, maximum stress and strain criteria, von Mises Yield criterion for isotropic materials, generalized Hill's criterion for anisotropic materials, Tsai-Hill's criterion for composites, prediction of laminate failure, thermal analysis of composite laminates.

Module III (12 hours)

Analysis of laminated plates- equilibrium equations of motion, energy formulation, static bending analysis, buckling analysis, free vibrations, natural frequencies.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Explain the characteristics and applications of composite materials, fibers, and matrices using real-world examples. (Understanding)

CO2: Apply the rule of mixtures and transformation matrix to determine the stiffness properties of an orthotropic lamina. (Applying)

CO3: Analyze the stresses in laminated composite plates using failure criteria such as Tsai-Hill and von Mises under specified loading conditions. (Analyzing)

CO4: Evaluate the structural performance of laminated composite plates through static bending, buckling, and free vibration analyses with reference to equilibrium equations. (Evaluating)

INTERNAL COMBUSTION ENGINES**(3 credits-45 hours) (L-T-P:3-0-0)**

This course aims to provide students with a comprehensive understanding of internal combustion engines (ICE) and their integration with modern propulsion technologies. It covers the fundamental principles, terminology, and operational systems of ICE, while exploring advancements such as hybrid systems, hydrogen combustion, and emission reduction technologies. The course emphasizes sustainable engineering practices and prepares students to analyze and design efficient, environmentally friendly powertrains for diverse applications.

Module I: Fundamentals of IC Engines and Hybrid Systems (10 hours)

Overview of internal combustion engines: history, types, and applications. Air standard cycles (Otto, Diesel, Dual) and their assumptions. Fuel-air cycles: effects of specific heat variation, fuel-air ratio, compression ratio, and dissociation. Introduction to hybrid propulsion systems: integration of ICE with electric motors, regenerative braking, and energy management. Losses in actual cycles and efficiency improvements in modern engines.

Module II: Fuel Delivery and Ignition Systems (10 hours)

Fuel delivery systems: carburetors (basics), multipoint fuel injection (MPFI), and gasoline direct injection (GDI). Diesel injection systems: common rail direct injection (CRDI), injectors, and nozzles. Ignition systems: spark plugs, battery, and magneto ignition, with advancements in plasma ignition. Firing order, ignition timing, and valve timing optimization. Introduction to electronic control units (ECUs) for precise fuel and ignition management.

Module III: Combustion, Supercharging, and Hydrogen Technology (12 hours)

Combustion processes in SI and CI engines: parameters affecting combustion, detonation, and knocking prevention. Combustion chamber design for efficiency and emissions control. Supercharging and turbocharging: thermodynamic principles, performance enhancement, and variable geometry turbochargers. Introduction to hydrogen combustion engines: design challenges, efficiency, and emission benefits. Comparison with traditional fuels.

Module IV: Lubrication, Cooling, Fuels, and Emission Control (13 hours)

Lubrication systems: properties of modern synthetic lubricants, wet and dry sump systems. Cooling systems: advancements in air and liquid cooling, thermal management in hybrid systems. Fuels: classification, characteristics, and ratings (octane, cetane). Alternative fuels: biofuels, hydrogen, e-fuels, and their environmental impact. Emission control: catalytic converters, particulate filters, selective catalytic reduction (SCR), and exhaust gas recirculation (EGR). Greenhouse gas emissions, regulatory standards and sustainable engineering practices.

COURSE/LEARNING OUTCOMES

After completing the course the students will be able to

CO1: Explain the principles of air standard cycles and fuel-air cycles, including the effects of specific heat variation and compression ratio (Understanding).

CO2: Apply fuel delivery and ignition system concepts to optimize combustion efficiency (Applying).

CO3: Analyze the impact of combustion chamber design and supercharging techniques on engine performance and emission control (Analyzing)

CO4: Evaluate lubrication, cooling, and emission control systems for sustainability and regulatory compliance (Evaluating,).

OPERATIONS RESEARCH (3 credits-45 hours)(L-T-P: 3-0-0)

Objective:

Module I: Introduction to Linear Programming (10 hours)

Introduction to linear programming - formulation, graphical method, Simplex method and its applications, initial basic feasible solution, optimality test, Big M method

Module II: Special topics in Linear Programming (15 hours)

Duality in linear programming, the dual simplex method, the revised simplex method,, Goal programming, and introduction to Integer programming.

Module III: The Transportation Model and The Assignment Model (10 hours)

- a) Formulation and solution of Transportation Model, North-west Corner method, Vogel's approximation method, stepping stone method, modified distribution method, degeneracy in Transportation problem, least time transportation problems,
- b) Mathematical representation and solution of assignment model, Hungarian method.

Module IV: Sequencing Problem, Replacement Analysis and Queuing Model (10 hours)

Assumptions in sequencing problem, processing of n jobs through one machine, two machines and three machines, processing of two jobs through m machines. Replacement of items whose maintenance and repairing cost increase with time, i) ignoring changes in the value of money, ii) value of money changes with time; replacement of items that fail suddenly. Introduction to Queuing Model.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall the fundamental concepts, terminologies,assumptions and methods used in linear programming, goal programming, transportation and assignment models, sequencing model, replacement analysis, and queuing theory.(Remembering)

CO2:Interpret the principles, formulations, and theoretical foundations of linear, duality, revised simplex method, and integer programming,various sequencing models, transportation and assignment problems, and queuing systems.(Understanding)

CO3:Apply suitable optimization techniques such as the graphical method,Simplex method, Big M method,revised simplex method,convert dual from primal, goal programming method Hungarian method,basic initial solution of various transportation model, Modi method,graphical and various sequencing model solution and queuing models to solve real-world engineering and managerial problems.(Applying)

**Mechanical Engineering Lab V: Design – II
(1 Credits) (L-T-P: 0-0-2)**

Objectives:

- (i) To understand the deformation behaviour of materials
 (iii) To understand the kinematic and dynamic characteristics of mechanical devices Contents

List of Experiments:

1. Determination of the sleeve lift for various speeds of a Hartnell governor.
2. To plot follower displacement vs Cam rotation for various cam follower systems.
3. Velocity ratios of simple, compound, epicyclic and differential gear trains.
4. Study of four bar mechanism, slider crank mechanism and their inversions.
5. Cam and follower and motion studies.
6. Determination of natural frequency of an undamped single and two degree freedom system.
7. Single degree of freedom Spring-mass-damper system, determination of natural frequency and damping coefficient.
8. To study the free vibration and to determine the natural frequency of vibration of the Two-Rotor system.
9. To study the torsional vibration and to determine the natural frequency vibration of a single rotor system.

**Mechanical Engineering Lab VI: Manufacturing
(1 Credits) (L-T-P: 0-0-2)**

Objectives:

To provide an understanding of various manufacturing processes.

To get an idea of the dimensional and form accuracy of products.

1. Facing, Turning: Step turning, taper turning.
2. Thread Cutting- Internal and external thread cutting using a single point cutting tool.
3. Contour milling using a vertical milling machine.
4. Spur gear cutting in milling machine.
5. Study of CNC part programming.
6. Use of CNC machine tools: Lathe (2 Axis)
7. Use of CNC machine tools: Milling (3 Axis)
8. Use of CNC machine tools: Milling (4 Axis)
9. Study and use of Universal Robot Arm.

Mini project Objective:

Process:

1. Literature Review
2. Synopsis Presentation
3. Progress Presentation
4. Model/Prototype/ Software analysis Project Execution
5. Final Presentation and Demonstration of the Project

Course Outcomes

After completing the course successfully the students will be able to-

1. Apply practical knowledge within the chosen area of technology for project development. (Applying)
2. Demonstrate the skills to carry out research work independently. (Understanding)
3. Plan for executing projects with a comprehensive and systematic approach. (Applying)
4. Take part in development of technical projects as an individual or in a team. (Analyzing)
5. Develop effective communication skills for presentation of project related activities. (Creating)

Royal Enfield Fresher's Course (NC- 30 hours) (L-T-P: 1-0-2)

Objective: To make the learners familiar with the state of the art of Royal Enfield two wheelers' working, troubleshooting and servicing and technical knowhow of different parts.

Pre-requisite: Basic knowledge of IC engines, Kinematics & Theory of Machines

Module I: Technical theory Sessions (6 hours)

History, 4 stroke/2 stroke engines and their working, bore, stroke, cubic capacity, technical specifications of engine & components, valve overlapping, Electrical Connections, parts locations, different sensors- their working & troubleshooting, clutch, brake, chain, suspension, steering, BS IV and BS VI

Module II: Practical Sessions (24 hours)

Hands on training Practical on UCE, Himalayan, 650, meteor. Dos and Don'ts at training center, engine dismantling, engine & gearbox assembly, wheel removal, refit, free play, clutch, suspension, steering, brake, air filter, use of multimeter & special tools, Electrical systems: inspection of components and troubleshooting.

Course Outcomes

After completing the course successfully the students will be able to-

1) identify various components of a RE bike, various tools used for servicing; practically understand the working and troubleshooting of various components of RE bike

REFRIGERATION AND AIR CONDITIONING

(3 credits-45 hours)(L-T-P: 3-0-0)

Objective:

This course provides an introduction to the principles and operation of refrigeration and air conditioning systems. Upon completion, students will be able to understand the functionality of vapor compression and absorption refrigeration systems, evaluate refrigerants based on their properties, environmental impact, and selection criteria, and apply psychrometric principles to analyze air conditioning processes using psychrometric charts. With the increasing demand for energy-efficient and environmentally sustainable cooling solutions, this course equips students with the foundational knowledge to develop advanced refrigeration and air conditioning technologies.

Module I: Fundamentals and Air Refrigeration Systems (10 Hours)

Introduction: Definitions of refrigeration and air conditioning; history; natural vs. artificial refrigeration; applications; unit of refrigeration, COP, EER; Joule-Thomson effect; refrigerator vs. heat pump.

Air Refrigeration: Reversed Carnot cycle; Bell-Coleman cycle (analysis, T-s/p-h diagrams); aircraft refrigeration (simple, bootstrap, regenerative, reduced ambient); merits and demerits.

Module II: Vapor Compression and Absorption Systems (12 Hours)

Vapor Compression Refrigeration (VCR): Ideal and actual VCR cycles (working, analysis, limitations); sub-cooling, superheating effects; multi-stage and cascade systems; COP improvement methods; numerical problems.

Vapor Absorption Refrigeration (VAR): Simple VAR working; aqua-ammonia and lithium bromide-water systems; rectifier and analyzer in aqua-ammonia systems; advantages, limitations, maximum COP.

Refrigerants: Nomenclature, classification, desirable properties, environmental considerations, selection.

Module III: Refrigeration Components and Alternative Systems (11 Hours)

VCR Components: Compressors (reciprocating, rotary, centrifugal, axial); condensers and evaporators (natural/forced convection); expansion devices; working principles.

Other Systems: Overview of steam-jet, vortex tube, thermoelectric, and magnetic refrigeration; comparison with VCR and VAR.

Module IV: Psychrometry and Air Conditioning (12 Hours)

Psychrometry: Air-water vapor mixtures; psychrometric properties; psychrometric chart; processes (sensible heating/cooling, latent heat, adiabatic mixing); sensible heat factor, bypass factor, apparatus dew point.

Air Conditioning: System classification (window, split, central, summer/winter/year-round); ASHRAE nomenclature; thermal comfort; cooling/heating load estimation; ventilation basics.

Equipment: Humidifiers, dehumidifiers, filters, fans, blowers; heat pump circuits.

Course Outcomes

After completing the course successfully the students will be able to-

Explain fundamental concepts of refrigeration, air conditioning, and their applications. (Understand)

Analyze the thermodynamic cycles of air and vapor refrigeration systems using T-s/p-h diagrams. (Analyze)

Evaluate the performance of refrigerants and components based on thermodynamic properties and environmental impact. (Evaluate)

Construct psychrometric processes using psychrometric charts. (Apply)

Compare various air conditioning systems based on cooling load, efficiency, and ASHRAE standards. (Analyze)

Computer Aided Design and Manufacturing 3 credits-45 hours)(L-T-P: 3-0-0)

Objective: To make the reader appreciate the importance of CAD CAM in the field of modern design and manufacturing of products and to understand the various underlying principles, techniques and technologies relating to the field.

Module I:(7 hours)

Introduction to CAD/CAM, need, advantages, Fundamentals of design process, stages in design process and product development cycle, Computers in design applications, role of computers in industrial manufacturing, components of CAD/CAM/CAE systems, system software and application software, CAD database and structure, coordinate systems in CAD, Typical Product Life Cycle

Module II:(10 hours)

Intro to Rigid body transformation, affine transformation and general transformations; Basic transformations: Translation, Rotation, Scaling, Reflection and Shear; Introduction to Homogeneous coordinate representation: 2D and 3D; Concatenated transformation.

Module III:(10 hours)

- a. 3D wire frame modeling, wire frame entities- definitions interpolation and approximation curves, concept of parametric and nonparametric representation of curves, curve fitting techniques, definitions of cubic spline and Bezier, B-spline.
- b. Surface modeling: Algebraic and geometric form, parametric space of surface, blending functions, Reparametrization of a surface patch, subdividing, cylindrical surface, ruled surface, surface of revolution, spherical surface, Composite surface, Bezier surface, B-spline surface.
- c. Solid modeling: Definition of cell composition and spatial occupancy enumeration, sweep representation, constructive solid geometry, boundary representations.
- d. Product data exchange: Need, advantage, IGES, STEP

Module IV:(9 hours)

- a. Introduction to NC, CNC, DNC; NC coordinate system; Introduction to NC part programming: manual part programming, computer assisted part programming (APT language), advantages and limitations of programming methods.
- b. Introduction to Robotics: Robot definition, origin and characteristics; History of robotics; Asimov's laws of robotics, types of robots, specifications and applications, advantages and limitations, Introduction to robot anatomy.

Module V:(4 hours)

Group technology and flexible manufacturing system: Part families, parts classification and coding, production flow analysis, machine cell design, FMS workstations, Material handling and storage system, Application of Group technology and FMS.

Course Outcomes

After completing the course successfully the students will be able to-

- 1. Name various hardware, software components and system requirements for implementing CAD/CAM; Illustrate the product design and manufacturing process ; state the different laws governing robotics & understand the use of robotics and automation in different environment; summarize the concepts of group technology, FMS and their applications
- 2. Solve transformation operation related problems to manipulate an object under consideration as per the need of the design/manufacturing process
- 3. Understand and compare various types of geometric modelling techniques, know different geometric primitives, curves, surfaces, product data exchange in CAD
- 4. Synthesize a CNC manual or computer assisted part program to use it for machining of different parts by various manufacturing operations.

**Gas Turbines and Jet Propulsion
(3 credits-45 hours)(L-T-P: 3-0-0)**

Objectives: This course provides an introduction to the principles and components of gas turbine power plants, enabling students to understand their major components and operational mechanisms. Students will develop skills to assess the performance of combined cycle power plants and gain knowledge about various combustion chamber designs and their modifications. Additionally, the course covers the classification of jet propulsion cycles and their working principles, preparing students to contribute to the design and optimization of efficient and advanced power generation and propulsion systems.

Module 1: Gas Turbines (10 hours)

Open cycle Arrangements, Closed cycle, Basic requirements of the Working Medium, Applications, Comparison of Gas Turbines with Reciprocating Engines, Assumptions in Ideal Cycle Analysis, Simple Gas Turbine Cycle, Reheat Cycle, Intercooled Cycle, Regeneration Cycle, Comparison of various cycles, Combined Steam-Gas Turbine Plant, Blade Materials, Manufacturing Techniques, Blade Fixing.

Module 2: Centrifugal and Axial Flow Compressors (10 hours)

Centrifugal Compressors: Essential Parts, Principle of Operation, Ideal Energy Transfer, Blade Shapes and Velocity Triangles, Analysis of Flow through the Compressor, Diffuser, Volute Casing, Performance Parameter, Losses in Centrifugal Compressor, Compressor Characteristics, Surging and Choking.
Axial Compressors: Geometry and Working Principle, Stage Velocity Triangles, Work Done Factor, Enthalpy-Entropy Diagram, Compressor Stage Efficiency, Performance Coefficients, Degree of Reaction, Flow through Blade Rows, Flow Losses, Stage Losses, Performance Characteristics.

Module 3: Combustion Chamber (8 hours)

Combustion Theory Applied to Gas Turbine Combustor, Factors affecting Combustion Chamber Design, Factors affecting Combustion Chamber Performance, Form of Combustion System, Requirements of the Combustion Chamber, Process of Combustion in a Gas Turbine, Combustion Chamber Geometry. Ignition and Pollution.

Module 4: Jet Propulsion Cycles and Rocket Propulsion (12 hours)

Reciprocating or Propeller Engines, Gas Turbine Engines, Ramjet engine, Pulse Jet engine, Turbo-prop engine, Turbo jet engine, Thrust and Thrust equation, Specific thrust of the Turbojet engine, Efficiencies, Parameters affecting Flight Performance.

Classification of Rockets, Principle of Rocket Propulsion, Analysis of an Ideal Chemical Rocket, Classification of Chemical Rocket-Solid Propellant, Liquid Propellant and Free radial rockets.

Course Outcomes:

After completing the course the student will be able to

CO1: Explain the operational principles and components of gas turbine cycles with reference to their applications. (Understand).

CO2: Apply velocity triangle analysis to calculate the performance parameters of centrifugal and axial flow compressors in gas turbine systems. (Apply)

CO3: Analyze the factors affecting combustion chamber design and performance in gas turbine systems. (Analyze)

CO4: Evaluate the performance of jet propulsion cycles and rocket propulsion systems using thrust equations and efficiency parameters to optimize design for specific application. (Evaluate)

**Automobile Engineering
(3 credits-45 hours)(3L: 0T:0P)**

Objective: This course is an introduction to the description and working of various mechanical parts of an automotive vehicle. After learning the course students will be able to understand the usage of mechanical components and their assembly. As there is a growing demand for design and development of modern environment friendly vehicles, this course serves as an introduction to enable students to develop better technologies.

Module 1: Introduction to Automobiles and Internal Combustion Engines ((5 hours)

History of automobiles; Classification of automobiles; Power plant classification; Engine terminology; Types of cycles; Working principle of an IC engine; Advanced classification of engines and multi cylinder engines; Engine balance and firing order.

Module 2: Fuel, Ignition & Electrical Systems (7 hours)

Spark Ignition engines – fuel tank, fuel filter, fuel pump, air filter, carburetor, direct injection of petrol engines; Compression Ignition engines –fuel injection (air and solid), pressure charging, super charging and turbo charging; Ignition systems– components, battery ignition, magneto ignition, electronic ignition and ignition timing; Main electrical circuits – generating and starting circuit, lighting, indicating devices.

Module 3: Lubrication and Cooling Systems (5 hours)

Functions and properties of lubricants, methods of lubrication; Oil filters, oil pumps, oil coolers; Characteristics of an effective cooling system; types of cooling systems; Radiator, thermostat, air cooling and water cooling.

Module 4: Automotive mechanisms and systems (20 hours)

Chassis & Transmission: Parts of automobile body; Automobile frames – functions, constructions, sub frames, materials and defects; Transmission – axles, clutches, propeller shafts, differential, gear boxes, automatic transmission, electronic transmission control, functions and types of front and rear axles, types and functions of clutches, Hotchkiss drive torque tube drive, traction control.

Steering, Braking and Suspension: Steering mechanism, steering gear box types, wheel geometry;

Brakes – principle, functions, types, construction, operation and parking brake; Suspension - types of spring shock absorbers, objectives and types of suspension system, rear axle suspension, electronic control and proactive suspension system

Module 5: Auxiliary Systems and Recent Trends (8 hours)

Automotive Air Conditioning: Ventilation, heating, air condition, refrigerant, compressor and evaporator. Wheels and Tyres: Wheel quality, assembly, types of wheels, wheel rims. Construction of tyres and tyre specifications.

Recent Trends: E-vehicles; Satellite-based navigation; Automated steering; Environment effect and mitigation.

Course Outcome:

CO1: Explain the fundamentals of automobile systems and internal combustion engine components such as classification, working cycles, and engine balancing.

CO2: Illustrate the construction and working of fuel, ignition, and electrical systems in both SI and CI engines.

CO3: Analyze the performance and effectiveness of automotive lubrication, cooling, transmission, suspension, steering, and braking systems.

CO4: Evaluate recent advancements in auxiliary systems and modern trends such as electric vehicles, automated steering, and environmental mitigation in automotive technology.

CO4: Examine the performance of transmission, suspension, steering and braking systems. (Analysing)

Introduction to Biomedical Engineering (3 credits-45 hours)(3L: 0T:0P)

Course Objectives: This course introduces the fundamental principles of biomedical engineering, emphasizing its interdisciplinary applications in healthcare. Students will analyze the working principles of biomedical instruments, sensors, and medical imaging systems, while also evaluating the mechanical properties of bio-

materials used in implants and prosthetics. Furthermore, the course explores emerging trends such as artificial intelligence in healthcare, wearable devices, and the ethical considerations surrounding medical technology, equipping students to contribute to innovative and responsible advancements in the field.

Module 1: Introduction to Biomedical Engineering (Hours: 10)

Overview of Biomedical Engineering - Definition, history, and interdisciplinary nature, Biomechanics, Biomaterials, Medical Imaging, Bioinformatics. Healthcare and Engineering - Role of engineers in medicine (diagnosis, treatment, rehabilitation), Medical vs. engineering perspectives. Ethics and Regulations - FDA, ISO standards, and ethical considerations in medical device design.

Module 2: Biomedical Instrumentation & Sensors (Hours: 12)

Biosensors and Bioelectronics, Principles of biosensors (electrochemical, optical, piezoelectric), Medical Instrumentation- ECG, EEG, EMG, MRI, Ultrasound, and X-ray systems. Diagnostic and Therapeutic Devices - Glucometers, dialysis machines, defibrillators.

Module 3: Biomechanics & Biomaterials (Hours: 11)

Biomechanics Fundamentals - Stress-strain in biological tissues, gait analysis, and joint mechanics. Biomaterials - Properties of metals, polymers, ceramics, and composites in implants. Biocompatibility and degradation.

Module 4: Medical Imaging & Emerging Trends (Hours: 12)

Imaging Techniques - Principles of CT, PET, SPECT, and Optical Imaging. Image Processing Basics - Segmentation, enhancement, and AI in diagnostics. Emerging Trends - Telemedicine, wearable devices, AI in healthcare, 3D bioprinting.

After completing this course, students will be able to:

CO1: Explain the role of biomedical engineering in healthcare and describe key subfields. (Understanding)

CO2: Demonstrate the working principles of biomedical instruments and biosensors. (Applying)

CO3: Apply biomechanical concepts to analyze biological tissues and evaluate biomaterials for medical devices. (Evaluating)

CO4: Analyze medical imaging modalities and their clinical applications. (Analyzing)

PRINCIPLE OF MEDICAL ELECTRONICS & BIOMEDICAL Instrumentation - Raja Rao & BGuha - University Press

Non-conventional Sources of Energy (3 credits-45 hours)(3L: 0T:0P)

Objective: To convey the knowledge of basics of different non conventional energy systems in detail so that it helps them in understanding the need and role of Non-Conventional Energy sources particularly when the conventional sources are meager in nature.

Module 1: Introduction (5 hours)

- a) Fossil fuel based systems: Impact of fossil fuel based systems. Non-conventional energy – Seasonal variations and availability. Renewable energy – sources and features. Hybrid energy systems Distributed energy systems and dispersed generation (DG)
- b) Traditional Energy Systems: Sources. Features and characteristics. Applications: Transport – bullock cart, horse carriage, camels; Agriculture – ox plough, water lifting devices; Human power – bicycle, cycle rickshaw etc.; House hold – cooking (bio mass), lighting etc.

Module 2: (11 hours)

- a) Solar Thermal Systems: Solar radiation spectrum. Radiation measurement. Technologies. Applications: Heating, Cooling, Drying, Distillation, Power generation
- b) Solar Photovoltaic System: Operating principles. Photovoltaic cell concepts. Cell, module, array. Series and parallel connections. Maximum power point tracking. Applications: Battery charging, Pumping, Lighting, and Peltier cooling.

Module 3: (7 hours)

- a) Microhydel: Operating principles. Components of a microhydel power plant. Types and characteristics of turbines. Selection and modification. Load balancing.
- b) Wind: Wind patterns and wind data. Site selection. Types of windmills. Characteristics of wind generators. Load matching.

Module 4: (6 hours)

- a) Biomass: Operating principles. Combustion and fermentation. Anaerobic digester. Wood gassifier. Pyrolysis. Applications: Biogas, Wood stoves, Bio diesel, Combustion engine.
- b) Wave Energy Systems: Shoreline systems. Near shore systems. Off shore systems.

Module 5: (7 hours)

- a) Costing: Life cycle costing (LCC). Solar thermal system LCC. Solar PV system LCC. Microhydel LCC. Wind system LCC. Biomass system LCC
- b) Hybrid Systems: Need for Hybrid Systems. Range and type of Hybrid systems. Case studies of Diesel-PV, Wind-PV, Microhydel-PV, Biomass-Diesel systems, electric and hybrid electric vehicles

Course outcomes: After completing the course successfully the students will be able to-

1. Compare the various fossil fuel sources with respect to their impact on the environment.
2. Analyze harnessing of solar energy.
3. Analyze harnessing of microhydel and wind energy
4. Analyze harnessing of Biomass and wave energy
5. To study and compare energy storage systems.

INTRODUCTION TO POWER PLANT (3 credits-45 hours)(L-T-P: 3-0-0)

Objective: To provide a comprehensive understanding of conventional and non-conventional power generation systems, their principles, components, performance evaluation, and energy scenario in India.

Module I (5 hours)

Introduction to different power plants, unconventional and non conventional power plants, Load duration curves, Location of power Plants, Power plant economics and their various terminology, Indian energy scenario.

Module II (15 hours)

Introduction to Carnot cycle Rankine cycle, Typical layout of steam power plant, Efficiencies in steam power plant, Different types of fuel and their properties, coal handling, ash handling of steam generation, Draught system, Natural Draught, Mechanical Draught. Pollution control technologies for coal.

Module III (13 hours)

a) Introduction to , Brayton cycle , Classification of different gas turbine power plants, Reheat, Intercooling and regeneration cycle, components of gas turbine plants, combined cycle power plants
b) Introduction to diesel cycle , working diesel engine, , Advantages and disadvantages of diesel engine power plant, General layout, Performance characteristics, Supercharging.

Module IV (12 hours)

a) Introduction, Classification of hydro-electric power plant, Site selection, Elements of hydro-electric power plant, Advantages of hydro-electric power plant, Classification of hydraulic turbines and its selection,
b) Introduction to nuclear engineering, Types of nuclear reactors, Pressurized water reactor, Boiling water reactor, CANDU reactor, Gas-cooled reactor, Liquid metal fast breeder reactor, India's nuclear power programme. Waste disposal for nuclear materials, Safety measures for nuclear power plants.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall the basic concepts, classifications, and layouts of various power plants including steam, gas, diesel, hydroelectric, and nuclear plants, as well as their operating cycles and component and various terminology use in economy of power plant(Remembering)

CO2: Explain the working principles, performance parameters, fuel properties, pollution control methods, and site selection criteria of different conventional and non-conventional power generation systems.(Understanding)

CO3: Solve load curve related problems and Apply thermodynamic cycles and plant performance analysis to evaluate the efficiency, of different power generation plants. (Applying)

Alternative NPTEL/SWAYAM Course:

Sr. No	NPTEL/SWAYAM COURSE NAME	Name of Instructor	Hosting Institute
1	https://nptel.ac.in/courses/112107291 Power Plant Engineering	Prof. Ravi Kumar	IIT Roorkee

Emerging Materials**(3 credits-45 hours)(L-T-P: 3-0-0)**

Objective: To provide foundational knowledge of materials science, including crystal structures, mechanical properties, and phase diagrams. It aims to explore the properties, applications, and heat treatment of metals, alloys, polymers, ceramics, and composites. Additionally, it introduces advanced materials and their electrical, magnetic, and smart material applications.

Module I Engineering Materials and Classification (10 hours)

Metals, plastics, ceramics and composites; Relevant properties (physical, mechanical, thermal, electrical, chemical), cost; Range of applications; Material designation and standards; Ashby diagrams; Selection criteria and process.

Module II Mechanical Properties and Testing (10 hours)

Tensile, compression, torsion, fatigue, fracture and wear tests; Young's modulus; Relations between true and engineering stress-strain curves; Generalized Hooke's law; Yielding and yield strength; ductility, resilience, toughness and elastic recovery; Hardness measurement their relation to strength; SN curve, endurance and fatigue limits; Introduction to non-destructive testing (NDT).

Module III Metal and Alloys (10 hours)

Iron and steel; Stainless steel and tool steels; Copper & its alloys – brass, bronze & cupro-nickel; Aluminium & Al-Cu-Mg alloys; Nickel based superalloys & Titanium alloys; Phase diagrams and interpretation of microstructure; Iron-iron-carbide phase diagram and cooling (TTT) diagrams.

Module IV Heat Treatment (10 hours)

Heat treatment of Steel; Annealing, tempering, normalizing, spheroidising, austempering, martempering, case hardening, carburizing, nitriding, cyaniding, carbo-nitriding, flame and induction hardening, vacuum and plasma hardening

Module V Polymers, Ceramics and Composites (10 hours)

Polymers – Classification and applications; Polymerization techniques; Ceramics – Oxide ceramics, ceramic insulators, bio-ceramics and Glasses; Composites – Reinforcement, matrix, metal matrix composites, ceramic composites, polymer composites; Other advanced materials – biomaterials, optical materials, high temperature materials, energy materials, and nanomaterials.

Module VI Electrical and Magnetic Materials(10 hours)

Conducting and resisting materials – types, properties and applications; Semiconducting materials – properties and applications; Magnetic materials – Soft and hard magnetic materials and applications; Superconductors and dielectric materials – properties and applications; Smart materials; Sensors and actuators; Piezoelectric, magnetostrictive and electrostrictive materials.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall fundamental concepts of crystal structures, defects, mechanical properties, and the classification of materials such as metals, ceramics, polymers, and composites.(Remembering)

CO2: Explain the microstructural evolution during phase transformations, heat treatment processes, and the relationships between material properties and their applications.(Understanding)

CO3: Analyze mechanical property measurements and phase diagrams to predict material behaviour under various loading and environmental conditions.(Applying)

CO4: Apply knowledge of advanced materials and their properties in designing solutions for engineering applications, including smart materials, biomaterials, and energy-efficient (Applying)

Major project I

(2 Credit– 60 hours) (L-T-P: 0-0-4)

Objective:

Process:

1. Literature Review
2. Synopsis Presentation
3. Progress Presentation
4. Model/Prototype/ Software analysis Project Execution
5. Final Presentation and Demonstration of the Project

Course Outcomes

After completing the course successfully the students will be able to-

1. Apply practical knowledge within the chosen area of technology for project development. (Applying)
2. Demonstrate the skills to carry out research work independently. (Understanding)

3. Plan for executing projects with a comprehensive and systematic approach. (Applying)
4. Take part in development of technical projects as an individual or in a team. (Analyzing)
5. Develop effective communication skills for presentation of project related activities. (Creating)

Scilab for Mechanical engineers

Objective: This course aims to equip mechanical engineering students with the essential skills to leverage SCILAB's powerful capabilities. By mastering the fundamental syntax, data manipulation techniques, and numerical methods, students will be empowered to solve complex engineering problems with efficiency and accuracy.

Module I: Introduction to SCILAB (8 hours)

Introduction to SCILAB and its working environment, Scripting and debugging techniques. Vectors and Matrices, Array operations, Function call, plots, Errors in Numerical computation.

Module II: Linear Algebra and Differential Equations using SCILAB (12 hours)

Basics of Linear Algebra, Gauss elimination and back substitution, LU decomposition and partial pivoting, Gauss Seidel method. Linear least square regression, nonlinear and functional regression. Differentiation of single variable, first order and second order ODEs and PDEs, SCILAB code applications.

Module III: Numerical Methods using SCILAB (10 hours)

Different numerical solutions of problems using Newton Raphson method, Euler's method, Runge-Kutta method. Fixed point iteration of single variable, Numerical integration.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Apply built-in functions and user-defined scripts to solve engineering problems numerically.

CO 2: Evaluate data effectively with various plotting tools and techniques.

CO 3: Analyze and interpret engineering data using statistical methods.

Additive Manufacturing (3 credits-45 hours)(L-T-P: 3-0-0)

Objectives: This course provides an introduction to Additive Manufacturing (AM), covering its evolution, terminology, and classification of processes. Students will explore the principles and working mechanisms of key AM technologies. The course emphasizes identifying suitable materials and AM methods for diverse design and manufacturing needs, while illustrating the general process flow, encompassing pre-processing, printing, and post-processing stages. Additionally, students will learn to apply basic selection criteria to align AM processes with real-world industrial applications, preparing them to leverage AM technologies effectively.

Module 1: INTRODUCTION TO ADDITIVE MANUFACTURING (9 hours)

Overview of AM: Definition, evolution, and Industry 4.0 integration. AM vs. Subtractive (CNC) & Traditional Manufacturing: Key differences, economic and sustainability aspects. AM Process Chain: From CAD to final part, Types of materials for AM, Advantages, Limitations and Benefits of AM.

Module 2: EXTRUSION AND POWDER BED FUSION AM PROCESSES (9 hours)

Basic Principles of AM, Process parameters, working principle, Applications, Vat Photopolymerization Processes, Stereolithography Apparatus (SLA), Solid ground curing (SGC). Laminated Object Manufacturing (LOM), Fused Deposition Modeling (FDM), Bio extrusion, Selective laser Sintering (SLS), Electron Beam melting (EBM).

Module 3: DIRECTED ENERGY DEPOSITION & HYBRID AM (9 hours)

Process parameters of Laser Engineered Net Shaping (LENS), Direct Metal Deposition (DMD), Friction stir AM (FSAM), Electron Beam Based Metal Deposition, construction, working principles, products, materials, advantages, limitations and applications - Functional effects and defects in AM.

Module 4: POST PROCESSING OF AM PARTS AND PROCESS (9 hours)

Post Processing of AM Parts: Support Material Removal, Surface Texture Improvement, Accuracy Improvement, Aesthetic Improvement, Preparation for use as a Pattern, Property Enhancements using Non-thermal and Thermal Techniques. Guidelines for Process Selection, Selection Methods for a Part, Challenges of Selection.

Module 5: RECENT ADVANCEMENTS AND APPLICATIONS OF AM (9 hours)

Hybrid AM: Ultrasonic AM (UAM), Cold Spraying AM (CSAM), Wire Arc Additive Manufacturing (WAAM), construction, working principles, advantages, limitations and applications

AM Applications: Application of AM parts as Visualization Tools, Aerospace applications, Automotive applications, Bio-Medical Applications, Construction Industry and Retail applications.

Course Outcomes:

On successful completion of the course, the student will be able to:

1. Explain the basic principles of additive manufacturing. (Understand)
2. Apply the working principles of additive manufacturing processes to select appropriate techniques for specific applications. (Apply)
3. Analyze the process parameters, functional effects, and defects in directed energy deposition and hybrid additive manufacturing processes to optimize part quality. (Analyze)
4. Evaluate the post-processing techniques and recent advancements in additive manufacturing to enhance part accuracy. (Evaluate)

POWER PLANT ENGINEERING
(3 credits-45 hours)(L-T-P: 3-0-0)

Objective: To provide a comprehensive understanding of conventional and non-conventional power generation systems, their working principles, components, performance evaluation, and prospects in India.

Module I (5 hours)

Introduction to different power plants, conventional and non conventional power plants, Location of power Plants, Power plant economics, Load duration curves and Indian energy scenario.

Module II (15 hours)

Introduction to Rankine cycle, Typical layout of steam power plant, Efficiencies in steam power plant, Co-generation of power and process heat, Combined cycle power generation, Different types of fuel and their properties, coal handling, ash handling of steam generation, Draught system, Natural Draught, Mechanical Draught. Pollution control technologies for coal. Performance of steam power plant

Module III (10 hours)

- a) Introduction, Classification of different gas turbine power plants, Analysis of closed cycle and open cycle constant pressure gas turbine plant, Reheat, Intercooling and regeneration cycle, components of gas turbine plants, combined cycle power plants, gas turbine fuels and gas turbine materials. Performance of gas turbine power plant, Advantages and disadvantages of gas turbine power plant.
- b) Introduction, Application of diesel engines in power field, Advantages and disadvantages of diesel engine power plant, General layout, Performance characteristics of diesel power plant, Supercharging.

Module IV (10 hours)

- a) Introduction, Classification of hydro-electric power plant, Site selection, Elements of hydro-electric power plant, Advantages of hydro-electric power plant, Classification of hydraulic turbines and its selection, Hydrographs, Flow duration curves. Selection of water turbine for hydroelectric power plant. Introduction to micro hydel power plant.
- b) Introduction to nuclear engineering, Types of nuclear reactors, Pressurized water reactor, Boiling water reactor, CANDU reactor, Gas-cooled reactor, Liquid metal fast breeder reactor, India's nuclear power programme. Waste disposal for nuclear materials, Safety measures for nuclear power plants.

Module V (5 hours)

Prospect of renewable energy source: solar energy, Wind energy, Bio-mass energy, Geo-thermal energy, Tidal energy and Thermal energy storage systems, Origin and their types; Working principles.

Course Outcomes

After completing the course successfully the students will be able to-

CO1: Recall the classifications, components, layouts, and operating principles of conventional and non-conventional power plants, including steam, gas, diesel, hydroelectric, nuclear, basic terminology used in economy of power plant and indian energy sources.(remembering)

CO2: Explain the thermodynamic cycles, fuel handling systems, environmental impacts, and performance characteristics of various power plants along with their advantages, disadvantages, and suitability based on site and energy requirements.(understanding)

CO3: Solve load curve related problems and Apply thermodynamic cycles and plant performance analysis to evaluate the efficiency of different power generation plants. (Applying)

CO4: Analyze performance curves of various power plants, selection of water turbine for hydroelectric power plant economic analysis of power plant (Analysing)

Electric Vehicle Technology
(3 credits-45 hours)(3L: 0T:0P)

Objective: This course provides an introduction to the dynamic behaviour and performance characteristics of electric vehicles. It includes study of traction motors, battery systems, drive cycles, and vehicle control strategies. After completing this course, students will be able to understand how electric vehicle components interact to influence motion, stability, and efficiency. With the increasing shift toward sustainable transportation, this course prepares students to contribute to the design, analysis, and improvement of advanced electric mobility systems.

Module I: Introduction to Electric Vehicle (15 hours)

History and benefits of Electric vehicles, Components of an EV, Comparison of IC engine vehicles and Electric vehicles, Vehicle layout and configuration, Types of electric vehicle, Types of Motors used in EV, Torque speed characteristics, Battery management systems, charging techniques and standards.

Module II: Fundamentals of Vehicle Dynamics (15 hours)

Design of Transmission system of EVs, Power train of HEV and EV.
Modelling and analysis of suspension systems, Braking and Steering systems for EVs, Stability and Control of EVs, Vehicle ride, Tire forces and Tire modelling of EVs.
Multi motor in wheel EVs, Safety of EVs.

Module III: Power Electronics and Control (15 hours)

Wiring Harness and architecture, HV and LV Harness design.

Basics of Induction motor, Open Loop v/f control, Basic pulse width modulation techniques, Vector control of IM drives.

Power converter design and PWM techniques, Modelling of PMSM drives, Vector Control of PMSM drives.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Understand the architecture and the components, types, benefits, and configurations of electric vehicles.

CO 2: Analyze the fundamentals of vehicle dynamics.

CO 3: Apply principles of power electronics and control to electric vehicle systems.

CO 4: Design and interpret wiring architecture and control strategies for electric vehicle propulsion and safety systems using modern engineering tools.

Renewable Energy Engineering (3 credits-45 hours)(L-T-P: 3-0-0)

Course objectives:

To facilitate the students to achieve a clear conceptual understanding of technical and commercial aspects of Wind, Solar, Biomass and Alternative Sources of Energy.

To enable the students to develop managerial skills to assess feasibility of alternative approaches and drive strategies regarding Wind, Solar, Biomass and Alternative Sources of Energy.

Module I INTRODUCTION (9 hours)

Global and national energy scenarios, concept of energy services, patterns of energy supply, energy resource availability, cultural, economic, and national security aspects of energy consumption, forms and characteristics of renewable energy sources, energy classification, source and utilization, thermodynamic power cycles and binary cycles.

Module II SOLAR ENERGY & BIOMASS ENERGY (9 hours)

Solar radiation, flat plate collectors, solar concentration, thermal applications of solar energy, photovoltaic technology and applications, energy storage. Energy from biomass, thermo-chemical, biochemical conversion to fuels, biogas, and its applications.

Module III WIND ENERGY (9 hours)

Wind characteristics, resource assessment, horizontal and vertical axis wind turbines, electricity generation and water pumping, Micro/Mini hydropower system, water pumping and conversion to electricity, hydraulic pump.

Module IV HYDROGEN & FUEL CELLS (9 hours):

Introduction to Fuel cell Technology, Various types of fuel cell systems, Low & high temperature fuel cells, Fuel cell thermodynamics, Fuel cell efficiency. Introduction to hydrogen economy, production, storage, and transportation systems, hydrogen from fossil fuels, transmission and infrastructure requirements, safety and environmental impacts, economics of transition to hydrogen systems.

Module V OTHER RENEWABLE SOURCES (9 hours)

Ocean thermal energy conversion, Geothermal, Tidal, Wave energy, MHD, environmental issues of energy sources.

Course outcomes:

After the completion of the course, the students will be able to:

Understand the fundamentals, availability, economics, and characteristics of the basic renewable energy sources.

Understand the fundamentals of solar energy and biomass energy.

Understand the fundamentals of wind energy.

Understand the fundamentals of hydrogen and fuel cells.

Understand the fundamentals of various renewable energy sources like geothermal, tidal, wave, etc.,

Major project II/ Internship

The major project phase II involves the students in realising their goal towards fulfilling the identified problem from the first phase of the major project. Accordingly students will design/ fabricate/analyse whichever is/are needed. The complete report of the work in proper format is prepared and finally the work is evaluated. The modality and components of the internal assessment and their weightages shall be notified at the beginning of each semester.

COURSE/LEARNING OUTCOMES

At the end of Project Phase II students will be able to

CO 1: Find potential gaps and needs related to mechanical engineering through study of existing literature. (Remembering)

CO 2: Interpret the potential gaps in mechanical engineering through literature review. (Understanding)

CO 3: Develop a feasibility study on the proposed topic. (Applying)

CO 4: Discover the problem statement. (Analysing)

CO 5: Assess the proposed topic by application of basic principles of mechanical engineering. (Evaluating)

CO 6: Evaluate and validate their respective results and propose further scope for advancement in that particular domain. (Evaluating)

CO 7: Compile their results using various engineering application tools. (Creating)

CO 8: Construct the mechanical engineering component using resources available. (Wherever applicable). (Creating)

CO 9: Build reports of the work. (Creating)

Honours Courses

Hydraulics Machine

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: The course familiarizes students with basic facts relating to working principles of hydraulic machines and equipment used in all industrial fields. It deals with pumps, hydraulic turbines and fluid mechanisms such as hydraulic elements, hydraulic transmissions and couplings.

Module I: Impact of free jets (8 hours)

Force exerted on stationary flat plate held normal to jet and inclined to jet, force exerted on curved plate, force exerted on moving flat plate normal to jet and moving inclined to the direction of the jet, jet propulsion of jet.

Module II: Hydraulic Turbines (12 hours)

Definition of fluid machine and energy transfer machines, Review of classification of hydraulic turbines, Impulse and reaction turbines, work done and efficiency of Pelton wheel, Francis turbine, propeller turbine and Kaplan turbine, theory of draft tube, Concept of specific speed, unit quantities of hydraulics turbine, performance characteristics of hydraulic turbines, cavitation in the turbine, governing of turbines.

Module III: Centrifugal pumps (10 hours)

Introduction to Rotodynamic pump, Review of classification of centrifugal pumps, working principles and head of centrifugal pumps, losses and efficiencies of centrifugal pumps, effect of variation of discharge on efficiency, multi stage centrifugal pumps, Concept of specific speed, characteristics performance of centrifugal pumps, Net Positive Suction Head, cavitation and priming of centrifugal pumps.

Module IV: Reciprocating pumps (10 hours)

Introduction to positive displacement pump, Review of classification of reciprocating pumps, working principles of reciprocating pumps, discharge, work done, power for reciprocating pumps, single acting and double acting reciprocating pumps, slip of reciprocating pump, effect of acceleration of piston on velocity and pressure in the suction and delivery pipes, indicator diagram and their effect on acceleration and, friction of suction and delivery pipes, air vessels and its effect on work done for reciprocating pump

Module V: Miscellaneous hydraulic machines (5 hours)

Working principle of hydraulic accumulator, hydraulic intensifier, hydraulic press, hydraulic crane, hydraulic lift, hydraulic ram, hydraulic coupling, hydraulic torque converter, jet pump, submersible pump, gear pump.

Virtual Lab

- 1.Characteristic curves of Pelton wheel
- 2.Conducting experiments and drawing the characteristics curves of Francis turbine
- 3.Characteristic curves of Kaplan turbine
- 4.Characteristic curves of reciprocating pump
- 5.Drawing the characteristic curves of Gear pump
- 6.Performance Characteristics of Centrifugal Pump
- 7.Performance Characteristics of Hydraulic Ram
- 8.Double Acting Reciprocating Pump

Course Outcomes

After completing the course successfully the students will be able to-

At the end of the course students will be able to:

CO1: Classify various types of hydraulic machines, hydraulic turbines, pumps and various other hydraulic machines (*Remembering*)

CO2: Explain working principles of various hydraulics machines, impact of jet, theory of draft tube, Concept of specific speed, performance characteristics of hydraulic machines, cavitation in the turbine, pumps, governing of turbines, multistage pumps (*Understanding*)

CO3: Explain effect of acceleration of piston on velocity and pressure in the suction and delivery pipes, indicator diagram and their effect on acceleration and, friction of suction and delivery pipes, air vessels and its effect on work done for reciprocating pump(*Understanding*)

CO3: Solve problems of work done and various efficiencies of turbines, pumps, hydraulic machines and impact of jet . (*Applying*)

CO4: Analysis unit quantities of hydraulic turbines and centrifugal pumps (*Analysis*)

Suggested Readings

Advanced Engineering Thermodynamics (3 Credits – 45 hours) (L-T-P: 3-0-0)

Course Objective:

To provide students with the skills to apply advanced thermodynamic concepts, such as exergy analysis and combustion theory, to improve the performance and sustainability of real-world engineering systems.

Module I: Fundamental Concepts, Property Relations and Real Gases (12 hours)

First and Second Law for open and closed systems; entropy generation; Maxwell relations; Clapeyron equation; Joule-Thomson coefficient; introduction to real-gas behaviour and equations of state (van der Waals); use of thermodynamic property tables and charts.

Module II: Exergy Analysis and Thermodynamic Optimization (11 hours)

Concept of exergy (availability); exergy balance and exergy destruction; second-law efficiency; exergy analysis of simple engineering components; Entropy generation minimization principle; thermodynamic optimization of a heat exchanger and a simple heat engine; Gouy-Stodola theorem.

Module III: Mixtures and Psychrometrics (11 hours)

Ideal gas mixtures; Gibbs phase rule; fundamentals of psychrometrics; use of psychrometric charts for basic air-conditioning processes (heating, cooling, dehumidification, humidification).

Module IV: Thermodynamics of Reactive Systems and Combustion (11 hours)

Heats of formation and combustion; first-law analysis of reacting systems; adiabatic flame temperature; introduction to chemical equilibrium; overview of combustion concepts (premixed and diffusion flames, flame speed, ignition).

COURSE/LEARNING OUTCOMES

After completing the course successfully, the students will be able to –

- CO1: Analyze thermodynamic systems using fundamental laws and property relations.
- CO2: Apply exergy analysis and entropy generation minimization to optimize engineering systems.
- CO3: Evaluate properties of gas mixtures and analyze air-conditioning processes using psychrometrics.
- CO4: Perform first-law analysis for reactive systems and characterize basic combustion processes.

Fluid Power Control

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: *The course familiarizes students with basic facts relating to working principles of hydraulic and pneumatic equipment used in all industrial fields. It deals with fluid power system, hydraulic transmissions and actuators, control valves and safety and maintenance of those systems*

Module I: Introduction to fluid power systems (7 hours)

Introduction to fluid power systems Fluid power system: components, advantages and applications. Transmission of power at static and dynamic states. Pascal's law and its applications. Fluids for hydraulic system: types, properties, and selection. Additives, effect of temperature and pressure on hydraulic fluid. Seals, sealing materials, compatibility of seal with fluids. Types of pipes, hoses, and quick acting couplings. Pressure drop in hoses/pipes

Module II: Pumps and actuators (10 hours)

Pumps and actuators Pumps: Classification of pumps, Pumping theory of positive displacement pumps, construction and working of Gear pumps, Vane pumps, Piston pumps,. Accumulators: Types, and applications of accumulators. Types of Intensifiers, Actuators: Classification cylinder and hydraulic motors, Hydraulic cylinders, single and double acting cylinder, Construction and working of rotary actuators such as gear, vane, piston motors, and Hydraulic Motor. Symbolic representation of hydraulic actuators

Module III: Components and hydraulic circuit design Components (10 hours)

Components and hydraulic circuit design Components: Classification of control valves, Directional Control Valves-symbolic representation, Pressure control valves - types, Control Valves -compensated and non-compensated, needle valve, Hydraulic Circuit Design: Control of single and Double -acting hydraulic cylinder, regenerative circuit, pump unloading circuit, speed control of hydraulic cylinder Pilot pressure operated circuits.

Module IV: Pneumatic power systems and Pneumatic control circuits (13 hours)

Introduction to Pneumatic systems: Pneumatic power system, advantages, limitations, applications, Characteristics of compressed air and air compressors. Structure of pneumatic control System, fluid conditioners-dryers and FRL unit. Pneumatic Actuators: Linear cylinder – types of cylinders, working, and end position cushioning, seals, mounting arrangements, and applications, symbols. Pneumatic Control Valves: DCV such as poppet, spool, suspended seat type slide valve, pressure control valves, flow control valves, types

and construction, use of memory valve, Quick exhaust valve, time delay valve, shuttle valve, twin pressure valve, symbols. Simple Pneumatic Control: Direct and indirect actuation pneumatic cylinders, speed control of cylinders - supply air throttling and exhaust air throttling.

Module V: Safety and Maintenance (5 hours)

Hydraulic safety, Hydraulic maintenance principles, Fluid contamination and filtration, The effects of contamination on hydraulic components, Maintenance suggestions, System testing procedures, System testing methods

After completing the course successfully the students will be able to-

At the end of the course students will be able to:

CO1: Classify various types of fluids for hydraulic system, types of pipes and hoses, types of hydraulic and pneumatic pumps and actuators, pressure control valves, symbolic representation of hydraulic actuators (*Remembering*)

CO2: Explain working principles of hydraulic pumps, actuators, cylinders, hydraulic motor, hydraulic circuit design Components, valves, safety and maintenance, (*Understanding*) ,

CO3: Explain working pneumatic power system, pneumatic control system, pneumatic actuators, pneumatic control valves (*Understanding*)

CO4: Apply how a hydraulic/pneumatic circuit will work to accomplish the function. (*Applying*)

CO3: Solve problems of work done and various efficiencies of turbines, pumps, hydraulic machines and impact of jet . (*Applying*)

CO4: Design an appropriate hydraulic or pneumatic circuit or combination circuit like electro-hydraulics, electro-pneumatics for a given application. (*Analysis*)

Convective Heat Transfer Analysis

(3 Credits – 45 hours) (L-T-P: 3-0-0)

Objective: To equip students with the skills to solve engineering problems in convective heat transfer by applying fundamental principles and standard correlations for internal, external, and natural flow scenarios.

Module I: Foundations and External Forced Convection (14 hours)

Introduction and applications of convective heat transfer; governing equations: derivation of continuity, momentum, and energy equations; the boundary layer concept: hydrodynamic and thermal boundary layers; similarity solutions: concepts and key results from the Blasius and Pohlhausen solutions; the Reynolds-Colburn analogy for momentum and heat transfer; laminar boundary layer over a flat plate: constant wall temperature and heat flux; introduction to turbulent boundary layers and the effect of Prandtl number.

Module II: Internal Flow Convective Heat Transfer (14 hours)

Internal flow fundamentals: hydrodynamic and thermal entry lengths; the concept of bulk mean temperature and energy balance; fully developed laminar flow: velocity and temperature profiles; heat transfer analysis

for classic cases: pipe flow with constant wall heat flux and constant wall temperature; introduction to turbulent internal flows and empirical correlations (e.g., Dittus-Boelter); application to non-circular ducts using the hydraulic diameter.

Module III: Natural and Mixed Convection (12 hours)

Fundamentals of natural convection: buoyancy and the Grashof number; scale analysis for natural convection flows; natural convection boundary layers on vertical and horizontal surfaces; integral method for natural convection over a vertical plate; introduction to natural convection in enclosures; overview of mixed convection and the Richardson number; application of common correlations for engineering geometries.

Module IV: Boiling, Condensation, and Conjugate Effects (5 hours)

Fundamentals of boiling heat transfer: pool boiling curve and regimes; fundamentals of condensation: Nusselt's theory for film condensation; introduction to conjugate heat transfer: coupled conduction and convection.

COURSE/LEARNING OUTCOMES

After completing the course successfully, the students will be able to –

- CO1:** Analyze external forced convection using boundary layer theory, similarity solutions, and analogies to calculate heat transfer and shear stress.
- CO2:** Evaluate internal convective heat transfer by analyzing entry lengths, fully developed flow, and applying correlations for ducts and pipes.
- CO3:** Solve natural and mixed convection problems using scale analysis, the integral method, and standard correlations.
- CO4:** Analyze phase-change heat transfer using the pool boiling curve and Nusselt's theory, and assess conjugate heat transfer effects.

 P.H. Oosthuizen and D. Naylor, Introduction to Convective Heat Transfer Analysis, McGraw-Hill, 1999.

Alternative Energy Sources (3Credits-45 hours)(L-3: T-0: P-0)

Objective: To provide students with a comprehensive understanding of alternative and renewable energy sources, their technologies, applications, and sustainability considerations in the Indian and global context.

Module 1: Introduction to Alternative Energy Sources (8 Hours)

Energy scenario: global and Indian context, Limitations of conventional energy sources, Need for alternative/renewable energy, Classification of alternative energy sources, Sustainability, energy security, and environmental impacts, Policy framework and national missions (NEMMP, National Solar Mission, etc.)

Module 2: Solar Energy Technologies (10 Hours)

Principles of solar radiation: solar geometry, extraterrestrial & terrestrial radiation, Measurement of solar radiation; instruments and data,

Solar thermal systems: Flat plate collectors, evacuated tube collectors, Concentrating collectors (parabolic trough, dish, heliostat fields), Solar water heating, solar cooking, solar industrial heating,

Solar photovoltaic (PV) systems: V cell materials, I–V characteristics, PV modules, arrays, efficiency, Balance of system (inverters, batteries, controllers), Stand-alone and grid-connected PV systems, Recent advancements: BIPV, solar tracking, floating solar

Module 3: Wind, Hydro, and Geothermal Energy (9 Hours)

Wind Energy: Wind characteristics and resource assessment, Types of wind turbines, power and torque characteristics, Components: rotor, gearbox, generator, yaw, pitch, Wind farm design and layout, Challenges: intermittency, noise, environmental issues

Hydro Energy: Small hydro and micro-hydel systems, Site selection and components, Types of turbines (Pelton, Francis, Kaplan), Mini/micro hydro applications for rural electrification

Geothermal Energy: Origin and types of geothermal resources, Geothermal power plants: dry steam, flash steam, binary cycle, Geothermal heating/cooling systems, Environmental considerations

Module 4: Biomass, Biofuels, and Waste-to-Energy (9 Hours)

Biomass Energy: Types of biomass and characteristics, Thermochemical conversion: combustion, gasification, pyrolysis, Biochemical conversion: anaerobic digestion, biogas plants

Biofuels: Biodiesel production: transesterification, Bioethanol, biobutanol from biomass, Algal biofuels and advanced biofuels

Waste-to-Energy Technologies: Municipal solid waste energy recovery, Refuse-derived fuel (RDF), Incineration, gasification, plasma arc conversion

Sustainability & Policy: Biomass resource assessment, Environmental and socio-economic aspects

Module 5: Emerging Technologies, Energy Storage & Hybrid Systems (9 Hours)

Emerging Alternative Energy Technologies: Ocean energy: tidal, wave, OTEC, Hydrogen energy: production (electrolysis, thermochemical), storage, fuel cells, Green hydrogen and fuel cell electric vehicles (FCEVs)

Energy Storage: Battery storage systems (Li-ion, flow batteries, NaS, advanced chemistries), Mechanical storage: pumped hydro, flywheel, compressed air energy storage (CAES), Thermal energy storage: sensible, latent, thermochemical

Hybrid Renewable Energy Systems: Solar–wind hybrid systems, Solar–biomass hybrid, Microgrids, smart grids, and distributed generation

Case Studies & Future Trends: Global innovations, India's alternate energy roadmap and policies

Course Outcomes:

After completion of the subject the students will be able to-

CO1 :Explain the need, scope, and types of alternative energy sources.

CO2 :Analyze solar thermal and photovoltaic systems for various applications.

CO3 :Understand wind, hydro, geothermal energy technologies and their operation.

CO4 :Describe biomass, biofuel, and waste-to-energy conversion methods.

CO5 :Evaluate emerging technologies, storage systems, and hybrid renewable energy solutions.

Energy Conservation and Waste Heat Recovery

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: To provide students with a comprehensive understanding of energy management, conservation practices, and waste heat recovery technologies in industrial and commercial settings. It focuses on analyzing thermal and electrical systems for energy efficiency, conducting energy audits, designing waste heat recovery solutions, and applying emerging technologies and policies to promote sustainable, low-carbon, and environmentally responsible energy use.

Module 1: Introduction to Energy Conservation (9 Hours)

Energy scenario: Global and Indian energy demand, supply gap, challenges.

Types of energy: Conventional and renewable energy resources.

Principles of energy conservation: Need, objectives, and benefits in industrial and commercial sectors.

Energy audit: Types (preliminary and detailed), steps, tools, and instruments.

Energy performance indicators: Benchmarking, energy intensity, specific energy consumption.
Basics of energy economics: Payback period, NPV, IRR, life-cycle costing.

Module 2: Energy Conservation in Thermal Systems (9 Hours)

Boilers: Types, efficiency, performance evaluation, energy-saving opportunities.
Steam systems: Steam traps, condensate recovery, insulation, piping design for conservation.
Furnaces: Types, efficiency, heat distribution, losses, and best practices.
Kilns, dryers, and ovens: Operating principles and energy optimization.
Thermal insulation: Types, materials, selection, economic thickness of insulation (EOT).
Case studies on thermal energy savings.

Module 3: Energy Conservation in Electrical Systems (9 Hours)

Electric motors: Types, efficiency classes, load analysis, improving motor performance.
Power factor improvement: Capacitors, automatic power factor controllers, economic benefits.
Transformers: Losses, efficiency enhancement techniques.
Lighting systems: LED technologies, daylight integration, lighting audit.
Compressed air systems: Leak reduction, pressure control, energy-efficient compressors.
HVAC systems: Energy-efficient design, variable speed drives, building energy management.
Case studies on electrical energy conservation.

Module 4: Waste Heat Recovery Systems (9 Hours)

Introduction to waste heat: Sources of waste heat in industry, temperature levels, classification.
Waste heat quantification: Calculation of heat losses, efficiency assessment.
Heat exchangers: Types, design considerations, performance and applications.
Regenerators and recuperators: Working principles and industrial uses.
Waste heat recovery equipment: Economizers, Heat pumps, Heat wheels, Waste heat boilers, Organic Rankine Cycle (ORC)
Applications in cement, steel, glass, and power plants.
Environmental benefits of WHR.

Module 5: Emerging Technologies, Policies, and Case Studies (9 Hours)

Cogeneration and tri-generation: Principles, types (topping/bottoming cycles), efficiency benefits.
Combined heat and power (CHP) systems: Industrial relevance, performance metrics.
Advanced WHR technologies: Thermoelectric generators, Phase Change Materials (PCM), absorption chillers.
Green buildings and energy conservation building code (ECBC).
National and international energy policies: BEE, PAT scheme, ISO 50001 – Energy Management Systems.
Sustainability and climate resilience: Energy efficiency for low-carbon development.

Course Outcomes:

After completion of the subject the students will be able to-

- CO1:** Understand energy scenarios, principles of conservation, and conduct energy audits.
- CO2:** Identify and implement energy-saving measures in thermal and electrical systems.
- CO3:** Design and evaluate waste heat recovery systems for improved energy efficiency.
- CO4:** Apply emerging technologies and policies to promote sustainable, low-carbon energy use.

DYNAMICS OF ELECTRIC VEHICLES

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: *This course provides an introduction to the dynamic behaviour and performance characteristics of electric vehicles. It includes study of traction motors, battery systems, drive cycles, and vehicle control strategies. After completing this course, students will be able to understand how electric vehicle components interact to influence motion, stability, and efficiency. With the increasing shift toward sustainable transportation, this course prepares students to contribute to the design, analysis, and improvement of advanced electric mobility systems.*

Module I: Introduction to Electric Vehicle (15 hours)

History and benefits of Electric vehicles, Components of an EV, Comparison of IC engine vehicles and Electric vehicles, Vehicle layout and configuration, Types of electric vehicle, Types of Motors used in EV, Torque speed characteristics, Battery management systems, charging techniques and standards.

Module II: Fundamentals of Vehicle Dynamics (15 hours)

Design of Transmission system of EVs, Power train of HEV and EV.

Modelling and analysis of suspension systems, Braking and Steering systems for EVs, Stability and Control of EVs, Vehicle ride, Tire forces and Tire modelling of EVs.

Multi motor in wheel EVs, Safety of EVs.

Module III: Power Electronics and Control (15 hours)

Wiring Harness and architecture, HV and LV Harness design.

Basics of Induction motor, Open Loop v/f control, Basic pulse width modulation techniques, Vector control of IM drives.

Power converter design and PWM techniques, Modelling of PMSM drives, Vector Control of PMSM drives.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Understand the architecture the components, types, benefits, and configurations of electric vehicle.

CO 2: Analyze the fundamentals of vehicle dynamics.

CO 3: Apply principles of power electronics and control to electric vehicle systems.

CO 4: Design and interpret wiring architecture and control strategies for electric vehicle propulsion and safety systems using modern engineering tools.

ROTOR DYNAMICS

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: *This course introduces the fundamental principles and dynamic behaviour of rotating machinery. It covers rotor vibration mechanisms, bearing characteristics, balancing methods, instability phenomena, FEM-based analysis, and condition monitoring techniques. By the end of the course, students will understand how mechanical, structural, and diagnostic factors interact to influence the stability, performance, and health of rotor systems.*

Module I: Fundamentals of Rotor Dynamics (15 hours)

Single Mass Rotors: Modelling, equation of motion, critical speed theory. Gyroscopic Effects in Rotors: Gyroscopic couples, whirling, forward/backward whirl. Torsional Vibrations: Torsional modelling, multi-degree systems, resonance. Transverse Vibrations: Bending modes, shaft flexibility, Campbell diagrams.

Module II: Bearings, Balancing & Rotor Instability (15 hours)

Fluid-film bearings, rolling element bearings, stiffness & damping. Experimental identification of stiffness, damping, cross-coupled terms. Balancing of Rotors: Static & dynamic balancing. Instability in Rotors: Oil-whirl, oil-whip, hysteretic instability, destabilizing cross-coupling.

Module III: Modelling, Analysis & Condition Monitoring (15 hours)

FEM Analysis of Rotors: Shaft element formulation, disk modelling, gyroscopic effects, critical speed prediction. Measurement & Signal Processing Techniques: Accelerometers, proximity probes, FFT, envelope analysis. Condition Monitoring of Rotors: Vibration signatures, fault diagnosis like misalignment, unbalance, rub, and looseness, Health monitoring.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Explain the fundamental principles governing rotor vibrations, gyroscopic effects, and vibration modes in rotating systems.

CO 2: Analyze rotor behavior using torsional/transverse vibration models and evaluate rotor stability under various operating conditions.

CO 3: Apply balancing techniques, bearing dynamic coefficients, and FEM procedures to model and solve rotor dynamic problems.

CO 4: Evaluate and interpret vibration measurements using advanced signal processing techniques for rotor health assessment and condition monitoring.

Suggested readings:

1. Dara Childs, Turbomachinery Rotordynamics: Phenomena, Modeling, and Analysis, Texas A&M University.
2. J. S Rao, Rotor Dynamics, New Age International, 1996.
3. G. Genta, Dynamics of Rotating systems, Springer, 2005.
4. R Subbiah, J. E. Littleton, Rotor and Structural Dynamics of Turbomachinery, Springer, 2018.

DESIGN OF MEDICAL DEVICES (3Credits-45 hours)(L-3: T-0: P-0)

Objective: *This course covers the complete lifecycle of medical device innovation, from identifying clinical needs to regulatory compliance and commercialization. It explores design controls, risk management, bio-materials, and validation strategies. Students will learn to translate engineering concepts into safe, compliant medical products, preparing them to solve real-world clinical challenges in the MedTech industry.*

Module I: Clinical Needs, Regulations and Design Controls (10 hours)

Introduction to Medical Device Industry, Needs Finding and Concept generation-observation and problem identification. Introduction to Regulatory frameworks and standards: FDA, ISO and Design controls, Introduction to Intellectual Property: patents, trademarks and trade secrets.

Module II: Concept Generation, Risk and Human Factors (12 hours)

Ideation and Concept screening: SCAMPER, Morphological charts, Pugh Matrix. Risk Management: Hazard analysis, failure mode and effects analysis. Risk assessment: Severity and probability. Risk mitigation strategies. Human factors engineering: Usability standards, User Interface design for medical environment, Reduction of error. Design for Assembly and Design for Manufacturing, Ethics in medical device design.

Module III: Prototyping, Materials and Manufacturing (12 hours)

Biomaterials and their compatibility: Metals, polymers, ceramics. ISO standard biological evaluations: Cytotoxicity, Hemocompatibility, Sensitization. Surface modification and sterilization compatibility. Rapid Prototyping Techniques: 3D printing in medical applications. Laser cutting, CNC machining and soft tooling. PCB design basics. Manufacturing: Injection molding, Cleanroom standards and sterilization methods.

Module IV: Testing, Validation and Clinical Translation (11 hours)

Verification: Engineering testing, tensile electrical safety, fatigue. Validation: Simulation. Clinical Trials Strategy: Good clinical practice, phases of clinical trials. Reimbursement and business models: CPT and DRG codes. Value proposition for hospital procurement, Go-to-market strategies, Post-market surveillance requirements.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Formulate a specific, validated clinical need statement by filtering observations and identifying stakeholders.

CO 2: Apply regulatory frameworks and design controls to categorize devices and plan the development pathway.

CO 3: Analyze device safety by executing a Risk Management plan (FMEA) and identifying failure modes.

CO 4: Select and justify appropriate biomaterials and manufacturing processes based on biocompatibility and cost constraints.

Suggested readings:

1. Zenios, Makower and Yock, Biodesign – The process of innovating medical technologies, Cambridge University Press, 2009.
2. Peter Ogradnik, Medical Device Design Innovation from Concept to Market, Elsevier, 2013.
3. Jagdish Chaturvedi, Inventing medical devices: A perspective from India, Create Space Independent Publishing Platform, 1st edition, 2015.
4. Gail Baura, Medical Device Technologies: A Systems Based Overview Using Engineering, Elsevier science, 2012.

**ADVANCED MECHANICS OF SOLIDS
(3Credits-45 hours)(L-3: T-0: P-0)**

Objective: This course provides an advanced understanding of deformation, stress analysis, and constitutive behaviour of solid materials using rigorous elasticity and continuum mechanics principles. It equips students with mathematical and analytical tools necessary to model complex stress-strain fields, evaluate structural behaviour under sophisticated loading, and solve boundary value problems involving bending,

torsion, curved members, and elastic foundations. By completing this course, students will be able to apply higher-level theoretical frameworks to analyze and design advanced structural components with enhanced precision.

Module I: Fundamentals of Stress, Strain & Mathematical Tools (15 Hours)

Introduction to Mechanics of Materials: Review of basic mechanics concepts. General approach to solving boundary value problems. Introduction to tensors: Stress and strain tensors. Gradient, divergence, and basic vector operators. Kinematics of Deformation: Motion and displacement fields, linearized strain measures, principal strains, strain transformation, compatibility conditions. Traction and Stress Concepts: Traction, Cauchy's stress theorem, octahedral shear stress and engineering stress.

Module II: Constitutive Relations & Basic Elasticity Solutions (15 Hours)

Equilibrium Equations: Derivation in Cartesian form, Physical interpretation. Generalized Hooke's law. Elementary Elasticity Boundary Value Problems: Displacement & stress formulation concepts. Airy's stress function. Bending of Prismatic Beams: Pure bending, symmetric vs asymmetric bending. Shear center. Shear stresses in thin-walled open sections.

Module III: Torsion, Curved Beams & Beam on Elastic Foundation (15 Hours)

Torsion of Beams: Thin-walled tubes & membrane analogy, warping effects. Bending of Curved Beams: Winkler-Bach formula, elasticity solution for simple curved beam cases. Beam on Elastic Foundation: Governing equation derivation, solution to beam on an elastic foundation subjected to a point load at the center, moment at the center.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Explain fundamental concepts of stress, strain, material behavior, and deformation in elastic solids.

CO 2: Apply equilibrium equations, constitutive laws, and mathematical tools to analyze stresses and strains in basic structural components.

CO 3: Analyze bending, torsion, and complex loading conditions in prismatic and curved beams using appropriate elasticity methods.

CO 4: Evaluate structural responses and develop simplified elasticity-based models for engineering problems.

Suggested readings:

1. L.S. Srinath, "Advanced Mechanics of Solids" Tata McGraw Hill, 2007.
2. M.H. Sadd, "Elasticity: Theory, Applications and Numerics", Academic Press, 2006..
3. A. C. Ugural and S. K. Fenster, Advanced Strength and Applied Elasticity, Pearson, 2012.
4. S. P. Timoshenko and J. N. Goodier, Theory of Elasticity, McGraw-Hill, 1970.

Finite Element Methods in Mechanical Engineering (3Credits-45 hours)(L-3: T-0: P-0)

Objective: To introduce the fundamental concepts and theoretical basis of the Finite Element Method (FEM) as a powerful numerical technique for solving engineering problems, and to enable students to formulate and solve one-dimensional and two-dimensional structural problems using FEM.

Module 1: Mathematical Foundations and Basic Concepts (10 Hours)

Introduction to FEM: The need for numerical methods, advantages and applications of FEM in engineering.; Review of Mechanics of Solids: Basic concepts of stress and strain, stress-strain relations (constitutive equations), and strain-displacement relations.; Weighted Residual Methods: Introduction to the Weighted Residual Method (WRM), focusing on Galerkin's method as the primary formulation technique in FEM.; Variational Formulation: Concepts of Potential Energy, Principle of Minimum Potential Energy, and the Rayleigh-Ritz method for approximate solutions.

Module 2: One-Dimensional (1D) FEM Analysis (10 Hours)

Discretization and Shape Functions: Concept of discretization, different types of 1D elements. Coordinates (local and global) and the derivation of shape functions (linear and quadratic) for 1D elements.; Element Formulation: Derivation of the element stiffness matrix and element load vector using the Potential Energy and Galerkin's approaches for a general 1D bar element.; Assembly and Solution: Assembly of the Global Stiffness Matrix and Global Load Vector. Application of Boundary Conditions (e.g., displacement and force), and solving the resulting system of linear algebraic equations; Applications: Solving 1D bar problems and 1D heat conduction problems.

Module 3: Truss and Beam Elements (10 Hours)

Plane Truss Analysis: Formulation of the element stiffness matrix for a Plane Truss element in local coordinates.; Coordinate Transformation: Introduction to Local and Global Coordinate Systems and the use of the Transformation Matrix to transform the element stiffness matrix from local to global coordinates.; Solution of Truss Problems: Assembly and solution of Plane Truss problems (both determinate and indeterminate) including the effect of temperature change and initial strain.; Beam Element: Introduction to the Euler-Bernoulli beam theory. Derivation of the shape functions and the element stiffness matrix for a 1D beam element.

Module 4: Two-Dimensional (2D) FEM and Applications (10 Hours)

2D Plane Stress/Strain: Introduction to Plane Stress and Plane Strain conditions.; Element Types: Derivation of Shape Functions and the stiffness matrix for the Constant Strain Triangle (CST) element (the most basic 2D element). Introduction to the Four-Noded Quadrilateral element.; Higher-Order Elements and Numerical Integration: Brief introduction to Isoparametric Elements and the concept of Numerical Integration (e.g., Gauss Quadrature) for evaluating element matrices.; Field Problems and Post-Processing: Introduction to solving steady-state Heat Conduction problems in 2D. Brief discussion on Preprocessing (mesh generation) and Post-processing (result visualization and interpretation).

COURSE OUTCOME

Upon successful completion of this course, students will be able to:

CO1	Formulate the governing differential equations of a physical problem using the variational and weighted residual (Galerkin's) approaches.
CO2	Derive the element stiffness matrix and load vector for one-dimensional bar and truss elements using the Principle of Minimum Potential Energy.
CO3	Solve static 1D structural problems (bars and trusses) by assembling the global system of equations and imposing boundary conditions.
CO4	Apply the concept of shape functions and stiffness formulation to the basic two-dimensional Constant Strain Triangle (CST) element.

CO5	Interpret the results of FEM analysis (displacements, stresses, reactions) and relate them to the fundamental principles of solid mechanics.

NON-LINEAR VIBRATIONS**(3Credits-45 hours)(L-3: T-0: P-0)**

Objective: *This course introduces the behavior of mechanical systems under nonlinear vibration, covering modeling techniques, nonlinear governing equations, approximate analytical methods, stability and bifurcation analysis, and numerical tools. It enables students to understand, analyze, and predict complex nonlinear responses in real-world engineering systems, preparing them to apply advanced vibration theories to design, diagnostics, and modern mechanical applications.*

Module I: Fundamentals of Nonlinear Vibrations (12 Hours)

Mechanical vibration: linear vs. nonlinear systems, types of forces & responses. Conservative and non-conservative systems. Equilibrium points & qualitative analysis: potential wells, center, focus, saddle. Common nonlinear phenomena: multiple responses, bifurcations, jump phenomena.

Module II: Nonlinear System Modelling & Governing Equations (12 Hours)

Derivation of nonlinear equations of motion: Force & moment approach, Lagrange principle, Extended Hamilton's principle, Multibody approach. Linearization techniques. Galerkin's method for continuous systems. Ordering techniques, scaling parameters, book-keeping parameter. Common nonlinear equations: Duffing, Van der Pol, Mathieu, Hill.

Module III: Approximate & Perturbation Methods (9 Hours)

Straightforward expansions & nonuniformity. Harmonic balance method, Linstedt–Poincaré method, Method of Averaging, Method of Multiple Scales, Method of Normal Forms. Incremental Harmonic Balance. Modified Linstedt–Poincaré method.

Module IV: Stability Analysis, Numerical Techniques & Applications (12 Hours)

Lyapunov stability criteria. Stability analysis from perturbed & reduced equations. Bifurcation of fixed-point responses: pitchfork, saddle-node, trans-critical. Hopf bifurcation. Stability & bifurcation of periodic responses, monodromy matrix, Poincaré section. Numerical methods: Runge-Kutta, Wilson-Beta. Frequency response curves; polynomial & algebraic solution methods. Basin of attraction (point-to-point & cell-to-cell mapping). Lyapunov exponents, FFT analysis, fractal dimensions. Applications: Duffing oscillator, Van der Pol oscillator. Multi DOF non linear systems.

Course Outcomes:

After completion of the subject the students will be able to-

CO 1: Explain the fundamental characteristics of nonlinear vibratory systems, including equilibrium behaviour, nonlinear responses, and bifurcation phenomena.

CO 2: Derive and construct nonlinear equations of motion for mechanical and continuous systems using energy principles and modelling techniques.

CO 3: Apply approximate and perturbation methods to investigate nonlinear vibration responses, including resonance, jump, and parametric excitation.

CO 4: Evaluate stability, bifurcation patterns, and numerical simulations of nonlinear systems and interpret results for engineering applications.

Suggested readings:

2. A. H. Nayfeh and D. T. Mook, Nonlinear Oscillations, Wiley, 1995.
3. J. S. Rao, Nonlinear Vibrations, New Age International, 2012.
4. D. J. Inman, Engineering Vibrations, Pearson, 2013.
5. G. Genta, Vibration Dynamics and Control, Springer, 2008.

Welding Technology

(3Credits-45 hours)(L-3: T-0: P-0)

Objectives: To familiarize the students with the fundamentals of arc welding processes, weld joint design, metallurgical aspects in welding of steel, and assessing the quality and suitability of weld joints., To equip the students' technological input for handling the problems in welding of selected metals and alloys.

Module 1: (6 Hours)

- a) Introduction: Evolution of welding; classification of welding processes; heat sources and shielding methods.
- b) Physics of Welding Arc: Welding arc; voltage distribution along the arc; thermionic and non-thermionic cathodes; theories of cathode and anode mechanism; arc characteristics and its relationship with power source; arc efficiency; heat generation; effect of type of shielding gas on arc; isotherms of arcs.
- c) Welding Power Sources: Conventional welding power sources; constructional features; static and dynamic characteristics; duty cycle; influence of inductance on arc and power source characteristics; internal and external regulation; specific power source requirements; special welding power sources.

Module 2: Arc Welding Processes (6 Hours)

Consumable electrode welding processes. Manual metal arc (MMA) welding; Gas metal arc welding; pulsed MIG welding; Submerged arc welding, Significance of flux-metal combination; Electroslag welding; heat generation; principle; Gas tungsten arc welding; selection of polarity, Plasma arc welding; transferred and nontransferred plasma arc welding; selection of gases; welding parameters; keyhole technique.

Module 3: Heat flow in welding (8 Hours)

Effect of welding parameter on heat distribution; calculation of peak temperatures; thermal cycles; cooling rate and solidification; Residual stresses and their distribution in welds; influence of residual stresses in static and dynamic loading, distortion.

Module 4: Design of weld joints (8 Hours)

Introduction to design; engineering properties of steels; Type of welds and weld joints; description of welds: terminology, definitions and weld symbols; edge preparation; sizing of welds in structure; Design for Static loading, Weld Calculations in lap, butt and fillet welds; design for fatigue loading, Introduction to Fatigue; nature of the fatigue process; fatigue strength; factors affecting fatigue life; improvement methods for fatigue strength; reliability analysis and safety factors applied to fatigue design.

Module 5: Testing and inspection of weld joints (6 Hours)

Chemical tests; Metallographic tests; Hardness tests; Mechanical test for groove and fillet welds-full section, reduced section and all-weld- metal tensile tests, root, face and side bend tests, fillet weld break tests,

creep and fatigue testing. Non-Destructive Testing of Weldments; Visual inspection; Dye-penetrant inspection; Magnetic particle inspection; Ultrasonic inspection principle of ultrasonic testing, Radiographic inspection –principle of radiography, X-ray tubes, gamma-ray sources, defect discernibility; Eddy current inspection; Leak tests: N.D.T. Standard procedure for specification and qualification of welding procedure.

Module 6: Weldability of metals (8 Hours)

Solidification of weld metal; heat affected zone (HAZ), factors affecting properties of HAZ; gas-metal, slag-metal and solid state reactions in welding and their influence on soundness of weld joint; lamellar tearing and hydrogen damage; weldability; definition, factor affecting the weldability of steel Carbon equivalent. weldability of steel, cast iron and aluminium alloys of commercial importance, failure analysis of welded joints.

Suggested Readings

1. The Metallurgy of Welding, 6th Edition, Lancaster, William Andrew Publishing, NY.
2. Principles of Welding (Processes, Physics, Chemistry and Metallurgy), Robert and Messler, Wiley Interscience Publishers.
3. Welding Hand Book Vol. 5; 7th edition, AWS, 1984.
4. Welding METALLURGY, S Kou, John Wiley, USA, 2003.
5. NPTEL LINK: <https://nptel.ac.in/courses/112/107/112107090/>
6. NPTEL LINK: <https://nptel.ac.in/courses/112/103/112103263/>
7. NPTEL LINK: <https://nptel.ac.in/courses/112/107/112107090/>

Course Outcomes:

After completing the course the student will be able

CO1: To define the welding process.

CO2: To classify the different types of welding.

CO3: To identify suitable processes for producing quality weldments based on materials and applications.

CO4: To inspect the quality of weldments and suggest methods of producing quality joints.

CO5: To compare the selection and design of appropriate consumables for welding involving different types of materials.

CO6: To an environment for developing and adopting in energy saving and eco-friendly techniques in welding industries.

Mechanical Micromachining

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: To introduce the fundamental physical principles governing manufacturing at the micro-scale, enable students to analyze the mechanics of material removal in mechanical micromachining processes, and describe the associated tooling, machine systems, and metrology used in fabricating micro-components.

Module 1: Fundamentals and Scaling Effects (10 Hours)

Introduction to Micro-Manufacturing: Definition, necessity, historical perspective, and scope of micro-products. Overview of micro-manufacturing methods (subtractive, additive, and hybrid).; Scaling Laws: Understanding the role of scale (component size: 1–1000 μm). Analysis of how physical parameters scale down: comparison of surface forces vs. volume forces, inertia, surface tension, friction, and thermal effects; Difference between Macro and Micro Machining: Comparison based on process mechanics (chip formation, ductility), machine components, overall machine structure, and operating environment.; Classification of Micro-Manufacturing: Differentiation between non-lithography-based (Mechanical) and lithography-based (MEMS) processes.

Module 2: Micro-Cutting Mechanics and Process Phenomena (10 Hours)

Micro-Machining Mechanism: Mechanics of micro-cutting, elastic deformation vs. plastic deformation, and ductile regime cutting.; Minimum Chip Thickness (MCT): Concept, influence of tool edge radius, and its significance in determining the material removal threshold.; Process Anomalies: Detailed study of Burr formation (types and control), Built-Up Edge (BUE) (formation and consequences), and their effects on

precision.; Surface Quality: Surface roughness generation mechanisms in micro-cutting. Role of cutting fluids and their effectiveness at the micro-scale.; Material Considerations: Influence of workpiece grain size relative to chip thickness.

Module 3: Micromachining Systems and Tooling (10 Hours)

Micro Tooling: Requirements of micro cutting tools (size, material, precision). Fabrication of Micro Cutting Tools (Focused Ion Beam, Wire EDM, Laser-based methods).; Micro Machine Structure: Structural requirements for high precision and stiffness. Design considerations for controlling thermal drift and vibration.; Miniature Machine Tools: Introduction to specialized miniature and desktop machine tools. Kinematic design and challenges in miniaturization.; Actuators and Drives: High-speed spindles (air bearings, magnetic bearings) and high-resolution motion control systems (piezoelectric actuators, linear motors). Importance of Spindle Run-out.

Module 4: Diamond Turning, Metrology, and Applications (10 Hours)

Diamond Turning: Detailed study of the Single Point Diamond Turning (SPDT) process for generating smooth, complex surfaces (e.g., optics). Machine configurations, mechanism, and applications (optical components, molds).; Metrology for Micromachining: Challenges in micro-metrology. Measurement of micro-features, surface roughness, and form errors.; Measurement Techniques: Introduction to necessary measurement tools: Atomic Force Microscopy (AFM), Scanning Electron Microscopy (SEM), and optical interferometry.; Applications and Future Trends: Case studies in various fields: Optics (free-form optics, microlens arrays), Biomedical (micro-implants, micro-fluidics), Automotive (injection nozzles), and future development trends.

Textbooks

- V. K. Jain, *Introduction to Micromachining* (2nd Edition), Narosa Publishing House. (Core textbook based on NPTEL recommendation)
 K. Cheng and D. Huo, *Micro-Cutting: Fundamentals and Applications*, Wiley.
 D. A. Dornfeld and D. E. Lee, *Precision Manufacturing*, Springer US.

Course Outcomes (COs)

Upon successful completion of this course, students will be able to:

CO1	Analyze the behavior of scaling laws (e.g., thermal, inertial) and differentiate between macro- and micro-machining mechanics.
CO2	Predict and explain the effects of minimum chip thickness, burr formation, and BUE on the quality of a micro-machined surface.
CO3	Describe the architecture, functional components, and tooling requirements for high-precision micro-machine tools.
CO4	Apply the principles of Single Point Diamond Turning (SPDT) and select appropriate metrology techniques (e.g., AFM, SEM) for inspecting micro-components.

Manufacturing Guidelines for Product Design
(3Credits-45 hours)(L-3: T-0: P-0)

Objective: *To enable students to understand the relationship between product design and manufacturing processes, and to develop the ability to design components and assemblies that are efficient to produce, assemble, and inspect by applying principles of DFM, DFA, and process-capability-based design.*

Module I (10 hours):

Introduction to product design and manufacturing: product life-cycle; traditional vs integrated design-manufacturing thinking; process capabilities; overview of manufacturing processes and their limitations; material selection principles.

Module II (10 hours):

Robust design and design for “X” (DFX) concepts; design for manufacturability and assembly (DFMA); ergonomics in product design; design for manual assembly.

Module III (10 hours):

Process-specific design guidelines: casting (sand, die), injection molding and extrusion, sheet-metal working, machining, powder metallurgy.

Module IV (10 hours):

Joining and assembly design: design for adhesive bonding, welding, brazing/soldering, mechanical fastening; design guidelines for plastics joining (induction, ultrasonic, spin, vibration welding); hole-making guidelines.

Module V (Optional / Project Module – integrated within the 40 hours):

Design for environment; product architecture; rapid prototyping (SLA, SLS, etc.); sustainability and manufacturing perspective in product design; concurrent design-manufacture approach.

Learning Outcomes (Course Outcomes)

After completing the course successfully the students will be able to-

CO 1: Explain how manufacturing processes influence product design and apply design-for-manufacturability (DFM) & design-for-assembly (DFA) principles.

CO 2: Develop design guidelines for different manufacturing processes (casting, machining, molding, joining) to minimize cost and increase quality.

CO3: Evaluate design alternatives from a manufacturing and environmental perspective, using process capability, robustness, and sustainable design thinking.

Design for Manufacturability Handbook by James G. Bralla, *McGraw-Hill*

Integrated Product and Process Design and Development, Edward B. Magrab et al. *CRC Press*

Advanced Manufacturing Methods
(3Credits-45 hours)(L-3: T-0: P-0)

Objective: To make the learner familiar with various advanced manufacturing processes; their need and capabilities. To make them aware about the modern trends in the field of manufacturing.

Module I : Introduction (3 hours)

Introduction to Modern Manufacturing Methods, their needs in today's manufacturing scenario, identification and characteristics of these processes, conventional versus modern manufacturing methods.

Module II: Mechanical Processes (8 hours)

Abrasive jet machining, Water jet machining, Abrasive water jet machining, Abrasive flow machining, Ultrasonic machining, Ultrasonic welding, their working principles, equipments, process capabilities, applications, advantages and limitations.

Module III: Chemical and Electrochemical Processes (8 hours)

Chemical machining, Photo chemical machining, Electrochemical machining, drilling, grinding, deburring, their working principles, equipments, process capabilities, applications, advantages and limitations.

Module IV: Electrothermal Processes (8 hours)

Electrodischarge machining (EDM), Electrodischarge wire cutting or wire EDM, Electrodischarge grinding, Electrochemical discharge grinding, their working principles, equipment, process capabilities, applications, advantages and limitations. Electron Beam Machining, Electron Beam welding, Plasma arc cutting, Ion beam machining.

Module V: Laser Processing (8 hours)

Process principle, type of laser, equipment, and laser processes: drilling, cutting, machining, welding, heat treating, cladding; applications, advantages and limitations.

Module VI: Introduction to some emerging trends in manufacturing (5 hours)

Micromanufacturing, manufacturing processes lead towards micro-manufacturing, micro electro mechanical systems (MEMS), LIGA, Rapid prototyping, 3D printing, concept of nanotechnology and nano-processing techniques.

COURSE/LEARNING OUTCOMES

After completing the course successfully the students will be able to-

CO1: Define and characterise advanced manufacturing and machining processes, their evolution and usefulness of them & compare with conventional manufacturing. Acquire fundamental knowledge about some emerging trends like rapid prototyping, 3D printing, micro-manufacturing etc.

CO2: Know the working and process capabilities of Mechanical processes like Abrasive jet machining, Water jet machining, Abrasive water jet machining, Abrasive flow machining, Ultrasonic machining etc.

CO3: Know the working and process capabilities of Chemical and Electrochemical Processes like chemical machining, Photo chemical machining, Electro-chemical machining etc.

CO4: Know the working and process capabilities of Electro-thermal Processes like

Surface Engineering

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: The course is designed to have systematic and comprehensive understanding on various aspects related with surface engineering of metallic components for enhanced tribological life.

Module 1: Introduction (9 hours)

Purpose and need of surface engineering, Surface sub-surface regions, Classification of surface modification techniques, Scope of surface engineering, Role of surface properties on friction and wear

Module 2: Wear mechanisms (10 hours)

- a) Advantages and limitations of surface engineering, Materials properties and its effect on performance of components, Fundamentals of wear mechanism: Adhesive wear, Fundamentals of wear mechanism: Abrasive wear, Fundamentals of wear mechanism: Surface fatigue wear.
- b) Fundamentals of wear mechanism: Corrosion wear, Fundamentals of wear mechanism: Cavitation wear, Fundamentals of wear mechanism: Erosion wear and Fretting wear, Fundamentals of wear mechanism: Diffusive wear and Seizure, Evaluation of damage on wear surfaces

Module 3: Materials for controlling wear (9 hours)

- a) Material properties for controlling wear: Material properties for specific type of wear, Structure and wear relationship for materials of commercial importance, New coating system: Functionally Graded Thermal Barrier Coatings (FGM), Thermal Barrier Coatings (TBCs), Guidelines for selection of materials for engineering the surface.

Module 4: Processes for controlling wear: Structure and Composition Modification (11 hours)

- a) Fundamental approaches of structural modification, Candidate materials for structural modification, Processes: Localised plastic deformation Processes: Localised plastic deformation, Shot peening, Burnishing
- b) Transformation hardening, Laser Hardening Processes, Induction hardening. Advantages, limitations and application, Fundamental approach of changing chemical composition, Candidate material for controlling wear.
- c) Carburizing and plasma carburizing, Carbo-nitriding and Cyaniding, Nitriding and plasma nitriding, Chromizing and Aluminizing V. Boronizing
- d) Laser Plasma TIG alloying, Vapor deposition and Ion implantation, Chemical vapour deposition (CVD) and Ion beam assisted CVD, Physical vapour deposition, Advantages, limitations and application

Module 5: Processes for Controlling Wear (8 hours)

- a) Coatings and Overlays: Fundamentals of approach, Heat input, and dilution, Welding based methods, Laser cladding Thermal spray based methods.
- b) Coatings and Characterization: Electrolysis based methods, Advantages, limitations and application Purpose, Characterization of soundness, Thickness measurement, Surface roughness measurement
- c) Characterization of Engineered Surfaces: Mechanical properties, Chemical properties, Metallurgical properties, Wear properties.

Course outcomes:

After completing the course successfully the students will be able to-

1. Define and the different types of surface engineering, and wear mechanisms. .
2. Classify and compare the surface engineering methodologies.
3. Analyze the processes for controlling wear.
4. Identify the suitable surface engineering technique as per the requirement.
5. Find methods to improve the surface characteristics.

**Mechanical Micromachining
(3Credits-45 hours)(L-3: T-0: P-0)**

Objective: To introduce the **fundamental physical principles** governing manufacturing at the micro-scale, enable students to **analyze the mechanics** of material removal in mechanical micromachining processes, and describe the associated **tooling, machine systems, and metrology** used in fabricating micro-components.

Module 1: Fundamentals and Scaling Effects (10 Hours)

Introduction to Micro-Manufacturing: Definition, necessity, historical perspective, and scope of micro-products. Overview of micro-manufacturing methods (subtractive, additive, and hybrid).; **Scaling Laws:** Understanding the role of scale (component size: 1–1000 μm). Analysis of how physical parameters scale down: comparison of surface forces vs. volume forces, inertia, surface tension, friction, and thermal effects; **Difference between Macro and Micro Machining:** Comparison based on process mechanics (chip formation, ductility), machine components, overall machine structure, and operating environment.; **Classification of Micro-Manufacturing:** Differentiation between non-lithography-based (Mechanical) and lithography-based (MEMS) processes.

Module 2: Micro-Cutting Mechanics and Process Phenomena (10 Hours)

Micro-Machining Mechanism: Mechanics of micro-cutting, elastic deformation vs. plastic deformation, and ductile regime cutting.; **Minimum Chip Thickness (MCT):** Concept, influence of tool edge radius, and its significance in determining the material removal threshold.; **Process Anomalies:** Detailed study of **Burr formation** (types and control), **Built-Up Edge (BUE)** (formation and consequences), and their effects on precision.; **Surface Quality:** Surface roughness generation mechanisms in micro-cutting. Role of cutting fluids and their effectiveness at the micro-scale.; **Material Considerations:** Influence of **workpiece grain size** relative to chip thickness.

Module 3: Micromachining Systems and Tooling (10 Hours)

Micro Tooling: Requirements of micro cutting tools (size, material, precision). **Fabrication of Micro Cutting Tools** (Focused Ion Beam, Wire EDM, Laser-based methods).; **Micro Machine Structure:** Structural requirements for high precision and stiffness. Design considerations for controlling thermal drift and vibration.; **Miniature Machine Tools:** Introduction to specialized miniature and desktop machine tools. Kinematic design and challenges in miniaturization.; **Actuators and Drives:** High-speed spindles (air bearings, magnetic bearings) and high-resolution motion control systems (piezoelectric actuators, linear motors). Importance of **Spindle Run-out**.

Module 4: Diamond Turning, Metrology, and Applications (10 Hours)

Diamond Turning: Detailed study of the **Single Point Diamond Turning (SPDT)** process for generating smooth, complex surfaces (e.g., optics). Machine configurations, mechanism, and applications (optical components, molds).; **Metrology for Micromachining:** Challenges in micro-metrology. Measurement of micro-features, surface roughness, and form errors.; **Measurement Techniques:** Introduction to necessary measurement tools: **Atomic Force Microscopy (AFM)**, **Scanning Electron Microscopy (SEM)**, and optical interferometry.; **Applications and Future Trends:** Case studies in various fields: **Optics** (free-form optics, microlens arrays), **Biomedical** (micro-implants, micro-fluidics), **Automotive** (injection nozzles), and future development trends.

Textbooks

V. K. Jain, *Introduction to Micromachining* (2nd Edition), Narosa Publishing House. (Core textbook based on NPTEL recommendation)

K. Cheng and D. Huo, *Micro-Cutting: Fundamentals and Applications*, Wiley.

D. A. Dornfeld and D. E. Lee, *Precision Manufacturing*, Springer US.

Course Outcomes (COs)

Upon successful completion of this course, students will be able to:

CO1	Analyze the behavior of scaling laws (e.g., thermal, inertial) and differentiate between macro- and micro-machining mechanics.
CO2	Predict and explain the effects of minimum chip thickness, burr formation, and BUE on the quality of a micro-machined surface.
CO3	Describe the architecture, functional components, and tooling requirements for high-precision micro-machine tools.
CO4	Apply the principles of Single Point Diamond Turning (SPDT) and select appropriate metrology techniques (e.g., AFM, SEM) for inspecting micro-components.

Minor Courses

ENGINEERING MECHANICS

(3 Credits – 45 hours) (L-T-P: 2-1-0)

Objective: To provide foundational knowledge of statics, dynamics, and mechanics of rigid bodies, including force systems, friction, and equilibrium analysis. It aims to develop skills in analysing Truss, motion, energy principles, and vibrations in mechanical systems. Additionally, it introduces the application of virtual work, stability, and dynamics of rigid and particle systems in engineering contexts.

Module I (9 hours)

- Force Systems Basic concepts, Particle equilibrium in 2-D and 3-D; Rigid Body equilibrium; System of Forces, Coplanar Concurrent Forces, Components in Space – Resultant- Moment of Forces and its Application; Couples and Resultant of Force System, Equilibrium of System of Forces, Free body diagrams, Equations of Equilibrium of Coplanar Systems and Spatial Systems; Static Indeterminacy.
- Friction: Types of friction, Limiting friction, Laws of Friction, Static and Dynamic Friction; Motion of Bodies, wedge friction, screw jack and differential screw jack.

Module II (9 hours)

Equilibrium in three dimensions; Method of Sections; Method of Joints; How to determine if a member is in tension or compression; Simple Trusses; Zero force members; Beams and types of beams; Frames and Machines.

Module III (9 hours)

Centroid of simple figures from first principle, centroid of composite sections; Centre of Gravity and its implications; Area moment of inertia- Definition, Moment of inertia of plane sections from first principles, Theorems of moment of inertia, Moment of inertia of standard sections and composite sections; Mass moment inertia of circular plate, Cylinder, Cone.

Module IV (10 hours)

- Particle dynamics- Rectilinear motion; Plane curvilinear motion (rectangular, path, and polar coordinates). 3-D curvilinear motion; Relative and constrained motion; Newton's 2nd law (rectangular, path, and polar coordinates). Work, kinetic energy, power, potential energy. Impulse-momentum (linear, angular); Impact (Direct and oblique).
- Introduction to Kinetics of Rigid Bodies- Basic terms, general principles in dynamics; Types of motion, Instantaneous centre of rotation in plane motion and simple problems; D'Alembert's principle and its applications in plane motion and connected bodies; Work energy principle and its application in plane motion of connected bodies; Kinetics of rigid body rotation.

Module V (7 hours)

Basic terminology, free and forced vibrations, resonance and its effects; Degree of freedom; Derivation for frequency and amplitude of free vibrations without damping and single degree of freedom system, simple problems, types of pendulum, use of simple, compound and torsion pendulums.

Course Outcomes

After completing the course successfully the students will be able to-

CO1 : Identify and recall the basic principles of engineering mechanics, including force systems, friction, equilibrium, motion, vibrations, and the fundamental governing laws and equations. (Remembering)

CO2 : Interpret and explain the concepts of 3D equilibrium, centroid, moment of inertia, virtual work, and energy methods, and illustrate their relevance in engineering problem-solving. (Understanding)

CO3 : Use the principles of mechanics to solve engineering problems involving force analysis, trusses, beams, particle motion, and vibration systems. (Applying)

CO4 : Evaluate and analyze complex mechanical systems considering stability, motion, and energy interactions through techniques such as D'Alembert's principle, work-energy methods, method of joints, method of sections, and rigid-body dynamics. (Analyzing)

FLUID MECHANICS AND FLUID MACHINES (Minor)

(3Credits – 45hours) (L-T-P: 3-0-0)

Objective: To introduce fundamental concepts of fluid properties, pressure measurement, and fluid forces, teach principles of fluid static and dynamics including flow types, boundary layers, and dimensional analysis, and explore the working principles, pumps, and turbines.

Module I (13 hours)

Definition of fluid, Units and dimensions-Properties of fluids, Pascal law, Pressure measurement manometer, types of manometer and its application, Newton's law of viscosity, Forces on submerged plane and curved surfaces, buoyant force, metacentre, centre of buoyancy, equilibrium of floating and submerged body. Types of fluid flow: steady, unsteady, uniform, non-uniform, laminar, turbulent, compressible, incompressible, rotational, irrotational, one, two, three dimensional flows, velocity, acceleration, Velocity potential function, Stream function. Bernoulli's equation and its applications to Venturimeter, Orificemeter and Pitot tube.

Module II (10 hours)

Introduction to laminar flow, Reynolds No, laminar flow through circular pipe and parallel plate. Turbulent flow: Reynold's experiment, laws of fluid friction, shear stress, types of boundary, Prandtl length concept, velocity distribution, mean velocity, velocity profile, Darcy Weisbach equation, friction factor.

Module III(6 hours)

Concept of boundary layer, laminar boundary layer, turbulent boundary layer, Laminar sub layer, Boundary layer thickness, displacement thickness, momentum thickness, energy thickness. Flow around submerged bodies- Streamlined and Bluff bodies.

Module IV (4 hours)

Introduction dimensional analysis. Need for dimensional analysis, Buckingham's pi theorem and its application.

Module V (12 hours)

Introduction to Fluid machines, types of fluid machines, classification of pumps, Centrifugal pumps, working principle, work done by the impeller, Reciprocating pump – working principle, types of reciprocating pump, Work done and power of reciprocating pump. Classification of water turbines, heads and efficiencies, velocity triangles- Pelton wheel, Francis turbine and Kaplan turbines.

Virtual Lab

Verification of Bernoulli's equation
Determination of coefficient of discharge of Venturimeter
Characteristic curves of Pelton wheel
Characteristic curves of Francis turbine
Characteristic curves of Reciprocating pump

Course Outcomes

After completing the course successfully the students will be able to-

At the end of the course students will be able to:

CO1: Define types of fluid and flow, the properties of fluids, basic law of fluid mechanics, basic fundamental theories of fluid mechanics, types of turbines, pumps and various hydraulic equipment, function and characteristic of hydraulics machines. (*Remembering*)

CO2: Explain different types of fluids, types of fluid flow, fundamental law of fluid mechanics, basic fundamental theories of fluid mechanics, various fluid mechanic equipment and hydraulics machines (*Understanding*)

CO3: Solve problems of fundamental law of fluid mechanics and work done and various efficiencies of turbines, pumps and hydraulic machines. (*Applying*)

Mapping of CO with PO & PSO**Suggested Readings**

BASIC THERMODYNAMICS**(3Credits-45 hours)(L-3: T-0: P-0)**

Objective: To provide an in-depth understanding of thermodynamic principles, including the laws of thermodynamics, entropy, and thermodynamic properties of substances. It aims to develop knowledge on air standard cycles and internal combustion engines, along with their performance and efficiency.

Module I: Fundamentals of Thermodynamics (10 Hours)

Thermodynamic systems and control volumes; properties, states, and processes; exact and inexact differentials; thermodynamic definition of work and displacement work; path dependence of work; thermodynamic equilibrium. Temperature, thermal equilibrium, Zeroth Law, temperature scales, and common thermometers. Definition of heat; examples of heat and work interactions.

First Law of Thermodynamics for cyclic and non-cyclic processes; limitations of the First Law; internal energy and enthalpy.

Module II: First and Second Laws for Flow and Non-Flow Processes (10 Hours)

General energy equation for a control volume; steady-state and steady-flow processes; applications to common flow devices; unsteady flow processes.

Second Law of Thermodynamics: heat engines and refrigerators; efficiency and COP; Kelvin–Planck and Clausius statements; reversible and irreversible processes; Carnot cycle and Carnot theorems.

Clausius theorem, entropy definition, Clausius inequality, and principle of entropy increase; entropy changes in various processes.

Module III: Properties of Pure Substances and Ideal Gases (10 Hours)

Pure substances: p-v, p-T, p-v-T, T-s, and h-s (Mollier) diagrams; dryness fraction; thermodynamic property charts. Equation of state of ideal gases; specific heats; internal energy, enthalpy, and entropy relations for ideal gases. Equations of state, compressibility factor and charts; gas mixtures—Dalton's Law, mixture properties, internal energy, enthalpy, and specific heats of mixtures.

Module IV: Thermodynamic Cycles and IC Engines (10 Hours)

Air-standard cycle assumptions; working and efficiency of Otto, Diesel, Dual, IC engines: definition, classification, performance parameters; construction and working principles of 2-stroke and 4-stroke engines; petrol and diesel engines; comparison of petrol and diesel engines.

Course Outcomes:

After completing the course successfully the students will be able to-

CO1: Explain the fundamental concepts of thermodynamic systems, properties, energy interactions, and the First and Second Laws of Thermodynamics.

CO2: Apply the principles of thermodynamics to analyze flow and non-flow processes, evaluate entropy changes, and interpret thermodynamic property diagrams and charts.

CO3: Analyze ideal gas behavior, gas mixtures, thermodynamic cycles, and internal combustion engines to determine performance parameters and compare cycle efficiencies.

Suggested Readings

1. Sonntag, R. E, Borgnakke, C. and Van Wylen, G. J., Fundamentals of Thermodynamics, John Wiley and Sons
2. Nag, P.K, Engineering Thermodynamics, Tata McGraw-Hill Publishing Co. Ltd,
3. Cengel, Boles, Thermodynamics An Engineering Approach, McGraw-Hill Publishing Co. Ltd
4. <https://archive.nptel.ac.in/courses/112/106/112106310/> (Engineering Thermodynamics)

Theory of Machines

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: To introduce students to the fundamental principles of **Kinematics and Dynamics of Machinery**, enabling them to identify, analyze, and understand the motion and force transmission characteristics of basic machine elements and common mechanisms.

Module 1: Fundamentals of Mechanisms (10 Hours)

Introduction: Definition of **Link, Kinematic Pair, Kinematic Chain, Mechanism, and Machine**. Differentiating between a mechanism and a machine.

Kinematic Pairs: Classification based on the type of relative motion and nature of contact ; lower and higher pairs.

Degrees of Freedom (DOF): Concept of **Mobility. Grubler's Criterion** (without detailed derivation) for calculating the DOF of planar mechanisms.

Kinematic Chains and Inversions: **Four-bar chain** and its common inversions. **Single Slider Crank Chain** and its inversions. **Double Slider Crank Chain** and its inversions

Steering Gear mechanism fundamentals

Module 2: Velocity and Acceleration Analysis (10 Hours)

Kinematic Analysis: Need for velocity and acceleration analysis.

Velocity Analysis (Graphical): **Relative Velocity Method** applied to the four-bar mechanism and the slider-crank mechanism. Concept of **Instantaneous Centre of Velocity (IC)** and the **Aronhold-Kennedy Theorem of Three Centres**.

Acceleration Analysis (Graphical): Components of acceleration: tangential, radial (centripetal), and **Coriolis** acceleration (qualitative understanding and application). Relative Acceleration Method applied to the four-bar mechanism.

Module 3: Power Transmission and Control Elements (10 Hours)

Gears and Gear Trains: Kinematics of gears. **Law of Gearing** (qualitative). Standard terminology; Classification of gears (Spur, Helical, Bevel, Worm); **Gear Trains:** Simple, compound, and **epicyclic (planetary) gear trains**. Calculation of **Velocity Ratio** for simple and compound gear trains, and basic analysis of epicyclic trains using the tabular method.

Cams and Followers: Classification of cams and followers. Standard types of follower motion (Uniform Velocity, Simple Harmonic Motion). Drawing the **Displacement Diagram** for various motions

Clutches and Brakes: Basic working principle and classification of clutches (single plate, centrifugal). Basic working principle and classification of brakes (block, internal expanding shoe).

Module 4: Dynamics of Machines (10 Hours)

Dynamics Introduction: Flywheel: Function and location. Calculation of **Mass Moment of Inertia** of a flywheel **Turning Moment Diagram (TMD)** for single-cylinder I.C. engine. **Fluctuation of Energy** and **Coefficient of Fluctuation of Speed.**;

Governors: Function of a governor. Classification: **Centrifugal Governors** (Watt, Porter, Proell). Simple problems on Porter Governor (defining height and speed change). Differentiating between a **Governor** and a **Flywheel.**;

Balancing of Rotating Masses: Concept of **Static and Dynamic Balancing**. Balancing of a single rotating mass by a single mass in the same plane and in a different plane.

Textbooks

S. S. Rattan, *Theory of Machines*, McGraw Hill Education.

Ghosh and Mallik, *Theory of Mechanisms and Machines*, East West Press Pvt. Ltd.

V.P Singh, *Theory of Machines*, Dhanpat Rai Publisher

R. S. Khurmi and J. K. Gupta, *Theory of Machines*, S. Chand Publishing.

Course Outcomes (COs)

Upon successful completion of this course, students will be able to:

CO1	Determine the Degrees of Freedom (DOF) of planar mechanisms and classify them based on their kinematic pairs and inversions.
CO2	Analyze the velocity of various points on a planar mechanism using the graphical Instantaneous Centre and Relative Velocity methods.
CO3	Calculate the velocity ratio and torque ratio for basic simple and epicyclic gear trains ; explain working of cam and follower, brake, clutch
CO4	Explain the function and operating principles of flywheels and centrifugal governors in controlling machine speed fluctuations and do balancing of rotational mass for a given situation

STRENGTH OF MATERIALS

3Credits-45 hours)(L-3: T-0: P-0)

Objective: To develop an understanding of the behaviour of solid materials under various types of loads by studying stress–strain relations, beam bending, torsion, deflection, and pressure vessel analysis, enabling students to apply fundamental mechanics principles to the design and analysis of structural and machine components.

Module I – Introduction to Stress, Strain and Deformation (8 Hours)

Deformation in solids; Hooke's law; stress and strain under tension, compression and shear; elastic constants and their relations; linear, shear and volumetric strains; principal stresses and principal planes; Mohr's circle for stress analysis.

Module II – Shear Force & Bending Moment in Beams (8 Hours)

Beams and types of supports; transverse loading on beams including point and distributed loads; shear force and bending moment diagrams for simply supported, cantilever and overhanging beams; theory of bending; bending stress distribution and neutral axis; shear stress distribution in beams.

Module III – Moment of Inertia & Beam Deflection (8 Hours)

Moment of inertia of sections and polar moment of inertia; deflection of beams using the double integration method; computation of slopes and deflections; Maxwell's reciprocal theorems.

Module IV – Torsion and Helical Springs (8 Hours)

Torsion of circular and hollow shafts; stresses, angle of twist and deformation; stepped and compound shafts; shafts fixed at both ends; stresses and deflection in helical springs.

Module V – Thin Shells (8 Hours)

Axial and hoop stresses in thin cylinders under internal pressure; deformation of thin-walled pressure vessels; thick cylinders and Lamé's theory; stress distribution and deformation in thick cylinders; spherical shells subjected to internal pressure.

Course outcomes:

After completing the course successfully the students will be able to-

CO1: Apply fundamental concepts of stress, strain, and material properties to analyze deformation and stress states in structural and mechanical components.

CO2: Determine shear forces, bending moments, stresses, torsion effects, and deflections in beams, shafts, springs, and pressure vessels using relevant theories and analytical methods.

CO3: Evaluate the strength and stability of engineering components under different loading conditions to support safe and effective design decisions.

Suggested Readings

1. Egor P. Popov, Engineering Mechanics of Solids, Prentice Hall of India, New Delhi, 2001.
2. R. Subramanian, Strength of Materials, Oxford University Press, 2007.
3. Ferdinand P. Beer, Russell Johnson Jr and John J. Dewole, Mechanics of Materials, Tata McGraw Hill Publishing Co. Ltd., New Delhi 2005.
4. https://onlinecourses.nptel.ac.in/noc19_ce18/

MANUFACTURING PROCESSES

(3Credits-45 hours)(L-3: T-0: P-0)

Objective: To provide students with a broad understanding of how engineering materials are shaped, machined, formed, and joined using various manufacturing processes, and to equip them with the knowledge needed to select and analyse appropriate processes for producing quality components.

Module I (10 hours)

Casting and moulding: Metal casting processes and equipment, Heat transfer and solidification, shrinkage, riser design, casting defects and residual stresses, Introduction to bulk and sheet metal forming, plastic deformation and yield criteria; fundamentals of hot and cold working processes; forging, rolling, extrusion, drawing and sheet forming (shearing, deep drawing, bending) principles of powder metallurgy.

Module II (10 hours)

Metal cutting: Single and multi-point cutting; Orthogonal cutting, various force components: Chip formation, Tool wear and tool life, Surface finish and integrity, Machinability, Cutting tool materials, Cutting fluids, Coating; Turning, Drilling, Milling and finishing processes, Introduction to CNC machining.

Module III (10 hours)

Additive manufacturing: Rapid prototyping and rapid tooling, Joining/fastening processes: Physics of welding, brazing and soldering; design considerations in welding, Solid and liquid state joining processes; Adhesive bonding.

Module IV (10 hours)

AJM, WJM, AWJM, USM-principles and key process parameters; EDM and Wire EDM-MRR, surface finish, tool wear, dielectric and power circuits; ECM-process parameters and MRR; LBM, PAM, and EBM—fundamentals and applications.

COURSE/LEARNING OUTCOMES

After completing the course successfully the students will be able to-

CO1: Describe the principles and operations of casting, forming, machining, joining, and additive manufacturing processes used in engineering production.

CO2: Apply the fundamental principles of casting, forming, machining, joining, and additive manufacturing to explain how engineering components are produced.

CO3: Select suitable manufacturing processes for specific applications based on accuracy, productivity, material characteristics, and design requirements.

SCHOOL OF TECHNOLOGY

DEPARTMENT OF COMPUTER APPLICATIONS

PROGRAMME: FIVE-YEAR BCA-MCA INTEGRATED PROGRAMME

DEGREE: INTEGRATED MASTER OF COMPUTER APPLICATIONS (iMCA)

VISION OF THE DEPARTMENT

Imparting knowledge of Computer Applications to mould individuals into IT professionals, researchers and entrepreneurs who are innovative, versatile and committed to society.

MISSION OF THE DEPARTMENT

1. To prepare students for professional career and higher studies by providing conducive teaching, learning and research environment.
2. To produce skilled individuals and entrepreneurs in emerging areas of technologies by academia-industry collaboration.
3. To instill in individuals a sense of commitment to work for the betterment of society using technology.

Program Outcomes (POs)

Upon successful completion of the IMCA programme, graduates will be able to:

PO1 – Computational Knowledge: Apply knowledge of computing fundamentals, mathematics, and advanced computer science concepts to model, analyze, and solve complex computing problems.

PO2 – Problem Analysis: Identify, formulate, and analyze complex computing and real-world problems using mathematical reasoning, research methods, and analytical skills.

PO3 – Design & Development of Solutions: Design, develop, and evaluate software solutions, systems, and processes that meet user needs, performance requirements, and societal considerations.

PO4 – Research and Innovation: Use research methodologies including literature review, experiment design, data analysis, and interpretation to generate innovative solutions and contribute to knowledge creation.

PO5 – Modern Tool Usage: Select, adapt, and apply modern computing tools, programming frameworks, and emerging technologies for solving complex tasks with an understanding of their limitations.

PO6 – Professional Ethics: Apply ethical principles, professional standards, and cybersecurity best practices while addressing legal, social, and environmental issues in computing.

PO7 – Communication and Presentation Skills: Communicate effectively with technical and non-technical audiences, prepare clear documentation, and deliver impactful presentations and reports.

PO8 – Individual & Team Work: Function effectively as an individual contributor, member, or leader in diverse professional teams, demonstrating collaboration and responsibility.

PO9 – Project Management & Entrepreneurship: Demonstrate knowledge of project management principles and entrepreneurial skills to plan, execute, and manage software projects and innovative ventures.

PO10 – Lifelong Learning: Recognize the need for continuous learning and adapt to technological advancements, industry trends, and professional development opportunities.

Program Specific Outcomes (PSOs)

PSO1 – Software System Design & Development: Design, implement, test, and deploy full-fledged software applications—including web, mobile, and enterprise systems using modern development frameworks, programming paradigms, and DevOps practices.

PSO2 – Intelligent Computing & Data-Driven Decision-Making: Apply data science, artificial intelligence, and machine learning techniques to extract insights, build predictive models, and design intelligent solutions for real-world applications.

PSO3 – Secure & Ethical Computing Practices: Apply security principles, ethical guidelines, and cybersecurity tools to protect systems, networks, data, and applications from threats and vulnerabilities.

BHARATIYA BHASHA INTEGRATION (NEP 2020):

In alignment with NEP 2020 recommendations promoting Bharatiya Bhashas, the laboratory courses support the

use of **Assamese, Hindi, and/or English** for programming comments, documentation, interface labels, and student submissions wherever pedagogically appropriate.

After successful completion of the first three years of the Integrated MCA programme, students shall be automatically promoted to the MCA component of the programme. However, students who wish to exit the programme after completing the three-year curriculum will be awarded the BCA degree, as per the approved exit policy.

LIST OF COURSES – INTEGRATED MCA

1.1	Mathematical Foundation of Computer Science I
1.2	Computer Architecture
1.3	Computer Architecture Lab
1.4	Problem Solving Techniques
1.5	Problem Solving Techniques Lab
1.6	Indian Knowledge System
1.7	Environmental Studies
1.8	General English – I
1.9	Communicative Hindi-I / Communicative Assamese-I / French Beginner Level I / Introduction to German Language – I
2.1	Mathematical Foundation of Computer Science II
2.2	Data Structures
2.3	Data Structures Lab
2.4	Operating Systems
2.5	Operating Systems Lab
2.6	Object-Oriented Programming using Java

2.7	Object-Oriented Programming using Java Lab
2.8	Web Technologies
2.9	Web Technologies Lab
2.10	Understanding India
2.11	Communicative Hindi-II / Communicative Assamese-II / French Beginner Level II / Introduction to German Language – II
3.1	Probability and Statistics
3.2	Database Management System
3.3	Database Management System Lab
3.4	Software Engineering
3.5	Python Programming
3.6	Python Programming Lab
3.7	Health and Wellness, Yoga Education, and Sports and Fitness
3.8	Service Learning Theory
3.9A	UI/UX Engineering and Component Design Systems
3.10A	UI/UX Engineering and Component Design Systems Lab
3.9B	Feature Engineering
3.10B	Feature Engineering Lab
3.9C	Introduction to Cybersecurity
3.10C	Cybersecurity Fundamentals Lab
4.1	Entrepreneurship and Startup Ecosystem
4.2	Computer Networks
4.3	Computer Networks Lab
4.4	Design and Analysis of Algorithm
4.5	Introduction to Artificial Intelligence
4.6	Introduction to Artificial Intelligence Lab
4.7	Design Thinking and Innovation
4.8	Service Learning Practice
4.9A	Server-Side Web Development using Django
4.10A	Server-Side Web Development using Django Lab
4.9B	Machine Learning
4.10B	Machine Learning Lab
4.9C	Network Security
4.10C	Network Security & Packet Analysis Lab
5.1	Quantitative Techniques
5.2	Industry Internship
5.3	Mini Project
5.4A	ReactJS Fundamentals
5.5A	ReactJS Fundamentals Lab
5.6A	Microservices & API Engineering
5.7A	Microservices & API Engineering Lab
5.8A	Advanced Data Management Systems
5.9A	Advanced Data Management Systems Lab
5.4B	Neural Network
5.5B	Neural Network Lab
5.6B	Digital Image Processing
5.7B	Digital Image Processing Lab

5.8B	Natural Language Processing
5.9B	Natural Language Processing Lab
5.4C	Ethical Hacking & Penetration Testing
5.5C	Ethical Hacking & Kali Linux Lab
5.6C	Cryptography & Secure Communication
5.7C	Cryptography Algorithms Implementation Lab
5.8C	Security Operations & Incident Response Management
5.9C	Security Operations Center Tools & Incident Response Lab
6.1	Generative AI
6.2	Generative AI Lab
6.3	Soft Skills
6.4	Minor Project
6.5A	Server-Side Development with Node.js and NestJS
6.6A	Server-Side Development with Node.js and NestJS Lab
6.7A	DevOps and Automation Engineering
6.8A	DevOps and Automation Engineering Lab
6.5B	Deep Learning for Computer Vision
6.6B	Deep Learning for Computer Vision Lab
6.7B	Predictive Analysis
6.8B	Predictive Analysis Lab
6.5C	Cloud & Web Application Security
6.6C	Cloud Security & Web Application Testing Lab
6.7C	Digital Forensics and Cyber Investigations
6.8C	Digital Forensics Analysis Lab

A: Specialization-I, B: Specialization-II, C: Specialization-III

DETAILED SYLLABUS**SEMESTER – I****CAMF101T: Mathematical Foundation of Computer Science – I
(3 credits - 45 hours) (L-T-P: 3-0-0)****Course Objective:**

The objective of this course is to introduce students to the fundamental mathematical concepts, structures, and reasoning techniques that form the theoretical foundation of computer science. It aims to develop their ability to apply logic, set theory, relations, functions, combinatorics, and graph theory in solving computational problems. The course also seeks to strengthen students' analytical thinking and problem-solving skills, enabling them to model, analyze, and reason about algorithms, data structures, and various aspects of computer system design.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1:** Provide a basic understanding of fundamental mathematical concepts such as sets, functions, matrix algebra, and discrete mathematics. (Understanding, Remembering)
- CO2:** Enable the students to use mathematical models and techniques to analyze and understand problems in computer science. (Applying, Analyzing)
- CO3:** Demonstrate how the mathematical principles give succinct abstraction of computer science problems and help them to efficiently analyze. (Analyzing, Creating)

Course Content:**MODULE I: Set, Relation and Function (12 Hours)**

Set, Set Operations, Properties of Set operations, Subset, Venn Diagrams, Cartesian Products. Relations on a Set, Properties of Relations, Representing Relations using matrices and digraphs, Types of Relations, Equivalence Relation, Equivalence relation and partition on set, Closures of Relations, Warshall's algorithm.

Functions, properties of functions (domain, range), composition of functions, surjective (onto), injective (one-to-one) and bijective functions, inverse of functions.

Some useful functions for Computer Science: Exponential and Logarithmic functions, Polynomial functions, Ceiling and Floor functions.

MODULE II: Counting and Recurrence Relation (10 Hours)

Basics of counting, Pigeonhole principle, permutation, combination, Binomial coefficients, Binomial theorem.

Recurrence relations, modelling recurrence relations with examples, like Fibonacci numbers, the tower of Hanoi problem. Solving linear recurrence relation with constant coefficients using characteristic equation roots method.

MODULE III: Elementary Graph Theory (11 Hours)

Basic terminologies of graphs, connected and disconnected graphs, subgraph, paths and cycles, complete graphs, digraphs, weighted graphs, Euler and Hamiltonian graphs.

Trees, properties of trees, concept of spanning tree. Planar graphs. Definitions and basic results on the topics mentioned.

MODULE IV: Matrix Algebra: (12 Hours)

Types of matrices, algebra of matrices—addition, subtraction, and multiplication of matrices, determinant of a matrix, symmetric and skew-symmetric matrices, orthogonal matrix, rank of a matrix, inverse of a matrix, applications of matrices to solve system of linear equations, Eigen values and Eigen vectors, Caley-Hamilton theorem.

Mapping of COs to Modules

Course Outcomes	Module I	Module II	Module III	Module IV
CO1	H	M	M	H
CO2	M	H	H	H
CO3	M	H	H	M

CACA102T: Computer Architecture
(3 credits - 45 hours) (L-T-P: 3-0-0)
Course Objective:

The course aims to provide foundational understanding of digital electronics and number systems, enable students to design and analyze combinational and sequential circuits, Introduce the organization and functioning of basic computers and CPUs, and develop conceptual clarity on memory organization and parallel processing techniques.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1: Explain the basics of Digital Electronics and Binary Number System (*Understanding*)
 CO2: Learn the designing and implementation of combinational circuit. (*Applying, Creating*)
 CO3: Learn the designing and implementation of sequential circuit. (*Applying, Creating*)
 CO4: Describe the organization and functioning of basic computers. (*Understanding, Analyzing*)
 CO5: Explain the concept of parallel processing and memory organization (*Understanding, Applying*)

Course Content:**MODULE I: Digital Principles and Number Systems (12 Hours)**

Digital Principles: Definition for Digital signals, Digital logic, Digital computers, Von Neumann Architecture, Boolean Laws and Theorems, K-Map: Truth Tables to K-Map, 2, 3 and 4 variable K Map, K-Map Simplifications, Don't Care Conditions, SOP and POS.

Number Systems: Decimal, Binary, Octal, Hexadecimal, Number System Conversions, Binary Arithmetic, Addition and subtraction of BCD, Octal Arithmetic, Hexadecimal Arithmetic, Binary Codes, Decimal Codes, Error detecting and correcting codes, ASCII, EBCDIC, Excess- 3 Code, The Gray Code.

MODULE II: Combinational and Sequential Circuits and Registers (11 Hours)

Combinational Circuits: Half Adder and Full Adder, Subtractor, Decoders, Encoder, Multiplexer, Demultiplexer

Sequential Circuits: Flip-Flops- SR Flip- Flop, D Flip-Flop, J-K Flip-Flop, T Flip-Flop.

Register: 4- bit register with parallel load, Shift Registers- Bidirectional shift register with parallel load
Binary Counters-4 bit synchronous and Asynchronous binary counter.

MODULE III: Basic Computer Organization and Design and CPU (12 Hours)

Basic Computer Organization and Design: Instruction Codes, Computer Registers, Computer Instructions, Timing and Control, Instruction Cycle, Memory-Reference Instructions, Input- Output Interrupt, Complete Computer Description, Design of Basic Computer, Design of Accumulator logic. **Central Processing Unit:** Introduction, General Register Organization, Stack Organization, Instruction Formats, Addressing Modes, Data Transfer and Manipulation, Program Control, Reduced Instruction Set Computer (RISC), RISC Vs CISC.

MODULE IV: Pipeline and Vector Processing and Memory Organization (10 Hours)

Pipeline and Vector Processing: Parallel Processing, Pipelining, Arithmetic Pipeline, Instruction Pipeline, RISC Pipeline. Input-Output Organization: Peripheral Devices, Input-Output Interface, Asynchronous data transfer, Modes of Transfer, Priority Interrupt, Direct memory Access, Input-Output Processor (IOP).

Memory Organization: Memory Hierarchy, Main Memory, Auxiliary memory, Associate Memory, Cache Memory, Virtual Memory, Memory Management Hardware.

Text Books:

1. Donald P Leach, Albert Paul Malvino, Goutam Saha- "Digital Principles & Applications", Tata McGraw Hill Education Private Limited, 2011 Edition.
2. M. Morris Mano- "Computer System Architecture", Pearson/Phi, Third Edition.

Reference Books:

1. William Stallings- "Computer Organization and Architecture", Pearson/PHI, Sixth Edition.
2. Andrew S. Tanenbaum- "Structured Computer Organization", PHI /Pearson 4th Edition,
3. M. V. Subramanyam, "Switching Theory and Logic Design", Laxmi Publications (P) Ltd.
4. Ikvinderpal Singh, Computer Organization Architecture, Khanna Book Publishing.

Mapping of COs to Modules

Course Outcomes	Module I	Module II	Module III	Module IV
CO1	H	M	L	
CO2	L	H	M	
CO3	L	M	H	
CO4		L	M	H
CO5			L	H

CACA103P: Computer Architecture Lab

(2 credit - 60 hours) (L-T-P: 0-0-2)

Course Objective:

The course aims to provide hands-on experience in digital logic circuit design, verification of fundamental logic gates and sequential circuits, as well as practical knowledge of computer hardware organization and troubleshooting. It helps students gain competency in both theoretical concepts of computer architecture and practical system-level skills including assembly, installation, and configuration.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1: Design, implement, and test combinational and sequential logic circuits using basic logic gates, flip-flops, counters, adders, decoders, and multiplexers. (Applying, Creating)
- CO2: Apply Boolean algebra and coding techniques (BCD, Gray, Excess-3) to realize digital functions and verify their truth tables. (Applying, Analyzing)
- CO3: Demonstrate knowledge of computer hardware components, perform system assembly, installation, configuration, and troubleshoot common hardware/software issues. (Applying, Evaluating)

MODULE I:

Verify logic behaviour of AND, OR, NAND, NOR, EX-OR, EX-NOR, Invert and Buffer gates

To study and verify NAND as a Universal Gate

To verify De- Morgan's theorem for 2 variables

Design and test of an S-R flip-flop using NAND/NOR gate

Convert BCD to Excess-3 code using NAND gate

To Convert Binary to Grey Code

Verification of Truth Tables of J-K Flip-Flop using NAND/NOR gate

Realize Decoder and Encoder circuit using Basic Gates

Design and implement the 4:1 MUX using gates

Implementation of 4-Bit Parallel Adder Using 7483 IC

Design and verify operation of half adder and full adder

Design and verify operation of half subtractor

Design and implement a 4-bit shift register using Flip flops

Implement Boolean function using logic gates in both SOP and POS

Design and implement a 4-bit synchronous counter

Design and verify 4-bit asynchronous counter

MODULE II:

Familiarize the computer system layout: marking positions of SMPS, motherboard, FDD, HDD, CD, DVD and add on cards

Identify the Computer Name and Hardware Specification (RAM capacity, Processor type, HDD, 32 bit/ 64 bit)

Identify and troubleshoot the problems of RAM, SMPS and motherboard

Configure BIOS settings- disable and enable USB and LAN

Adding additional RAM to the system. (Expanding RAM size)

To Study mother board layout of a system

Demonstrate the assembly of a PC

Demonstration of various ports: CPU, VGA port, PS/2 (keyboard, mouse), USB, LAN, Speaker, Audio

Install and configure windows OS

To study the installation of Printer and trouble shooting

Textbook

1. Morris Mano, *Digital Logic and Computer Design*, Prentice Hall of India
2. Carl Hamacher, Zvonko Vranesic, Safwat Zaky, *Computer Organization*, McGraw Hill
3. B. Govindarajalu, *Computer Architecture and Organization: Design Principles and Applications*, Tata McGraw Hill
4. Thomas C. Bartee, *Digital Computer Fundamentals*, Tata McGraw Hill

Mapping of COs to Modules

Course Outcomes	Module I	Module II
CO1	H	
CO2	H	
CO3		H

CAPS104T: Problem Solving Techniques
(3 credits - 45 hours) (L-T-P: 3-0-0)

Course Objective:

The objective of this course is to equip students with the skills and strategies required for effective problem analysis, algorithm design, and program development. It aims to introduce the fundamentals of computer systems, problem-solving methodologies, and programming language concepts, with a focus on structured programming using C. Students will learn to translate problem requirements into precise specifications, design solutions using structured constructs, implement algorithms in C, and apply debugging and testing techniques to ensure program correctness and efficiency.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1: Understand basic terminology of computers, problem solving, programming Languages and their evolution (Understanding)
- CO2: Create specification from problem requirements by asking questions to disambiguate the requirement statement. (Creating)
- CO3: Design the solution from specification of a problem and write pseudo code of the algorithm using basic building blocks or structured programming constructs (Sequence, Selection and Repetition statement). (Creating)
- CO4: Translate an algorithm into a C computer program (Creating)
- CO5: Testing and analysing programs using debugging tools. (Analyzing)

Course Content:

MODULE I: (11 Hours)

Problems And Problem Instances, Generalization and Special Cases, Types of Computational Problems, Classification of Problems, Analysis of Problems, Solution Approaches, Algorithm Development, Analysis of Algorithm, Efficiency, Correctness, Role of Data Structures in Problem Solving, Problem-Solving Steps (Understand the Problem, Plan, Execute, And Review), Breaking the Problem into Subproblems, Input/Output Specification, Input Validation, Pre and Post Conditions.

MODULE II: (12 Hours)

Structured Programming Concepts: Sequence (Input/Output/Assignment), Selection (If, If-Else) And Repetition (For, While, Do-While) Statements, Control Structure Stacking and Nesting.

Different Kinds of Repetitions: Entry Controlled, Exit Controlled, Counter Controlled, Definite, Indefinite and Sentinel-Controlled Repetitions.

Pseudocode and Flowcharts. Definition And Characteristics of Algorithms, Standard Algorithm Format.

Problems Involving Iteration and Nesting: Displaying Different Patterns and Shapes Using Symbols and Numbers, Generating Arithmetic and Geometric Progression, Fibonacci and Other Sequences, Approximate Values For π , $\sin(x)$, $\cos(x)$, Etc. Using Taylor Series. Different Kinds of Data in The Real World and How They are Represented in The Computer Memory.

Representation of Integers: Signed Magnitude Form, 1's Complement And 2's Complement. Representation of Real Numbers: IEEE 754 Floating Point Representation. Representation of Characters: ASCII, UNICODE.

C Language: Introduction To Programming Languages, Different Generations of Programming Languages. Typed Vs Typeless Programming Languages, History of C Language, An Empty C Program. C Language Counterparts for Input (scanf()), Output (printf()) Statements, Assignment, Arithmetic, Relational and Logical Operators. If, If-Else Statements, For, While, Do-While Statements.

Data Types, Translating Pseudocode/Algorithm to C Program. Incremental Compilation and Testing of The C Program. Simple Problems Involving Input, Output, Assignment Statement, Selection and Repetition. Good Coding Practices.

MODULE III: (10 Hours)

Problems on Numbers: Extracting Digits of a Number (Left to Right and Right to Left), Palindrome, Prime Number, Prime Factors, Amicable Number, Perfect Number, Armstrong Number, Factorial, Converting

Number from One Base to Another. Statistics (Maximum, Minimum, Sum and Average) on a Sequence of Numbers which are Read using Sentinel- Controlled Repetition using only a few Variables.

C Language: else-if Ladder, switch Case, Increment/Decrement Operators, break and continue Statements.

MODULE IV: (12 Hours)

Modular Programming, Top-Down and Bottom-Up Approaches to Problem Solving. Recursion. Problems on Arrays: Reading and Writing of Array Elements, Maximum, Minimum, Sum, Average, Median and Mode. Sequential And Binary Search. Any one Sorting Algorithm. Matrix Operations.

C Language: Function Definition and Declaration (Prototype), Role of Return Statement, One Dimensional and Two-Dimensional Arrays. String Functions. Other Operators, Operator Precedence and Associativity. Debugging.

Text Books

1. Venkatesh, Nagaraju Y, Practical C Programming for Problem Solving, Khanna Book Publishing Company, 2024.
2. AICTE's Programming for Problem Solving (with Lab Manual), Khanna Book Publishing Company, 2024.
3. Harvey Deitel and Paul Deitel, C How to Program, 9th edition, Pearson India, 2015.
4. R G Dromey, How to Solve It by Computer.

Reference Books

CO2	H	H	M	M
CO3	M	H	H	H
CO4		H	H	H
CO5		M	H	H

CAPS105P: Problem Solving Techniques Lab

(2 credits – 60 Hours) (L-T-P: 0-0-2)

Course Objective:

The objective of this course is to provide students with practical experience in applying problem-solving strategies, algorithmic thinking, and structured programming concepts to develop efficient solutions using the C programming language. Through a variety of programming exercises, students will strengthen their skills in control structures, modular programming, recursion, and data manipulation, as well as in implementing mathematical, logical, and pattern-based problems. The lab also aims to enhance students' ability to test, debug, and optimize programs while fostering computational thinking and creativity in approaching real-world problems.

Course Outcomes:

After successful completion of this course, students will be able to:

CO1: Develop algorithms for solving computational and mathematical problems using systematic problem-solving strategies. (*Applying*)

CO2: Implement algorithms in C using appropriate programming constructs such as sequence, selection,

repetition, and modularization. *(Creating)*

CO3: Apply recursion and modular programming techniques to design efficient and reusable solutions. *(Creating)*

CO4: Test, debug, and validate C programs to ensure correctness, reliability, and efficiency. *(Analyzing)*

CO5: Translate real-world problem statements into functional C programs with appropriate input/output handling and code documentation. *(Applying)*

Course Content:

MODULE I:

Converting degrees Celsius to Fahrenheit and vice versa

Display three input numbers in sorted (non-decreasing) order

Given a positive integer value n ($n \geq 0$) display number, square and cube of numbers from 1 to n in a tabular format?

Given an input positive integer number, display odd numbers from in the range $[1, n]$

Display the following patterns of n rows ($n > 0$), for the below examples $n = 5$

Hollow square pattern:	Triangle Patterns with numbers:	Square with diagonals:	Diamond Pattern
##### # # # # # # #####	1 121 12321 1234321 123454321	* *	* *** ***** *** *

Display first mathematical tables, each table up to 10 rows? Generalise this to display first n ($n > 0$) mathematical tables up to m ($m > 0$) rows

Given the first term (a), difference/multiplier (d) and number of terms ($n > 0$), display the first n terms of the arithmetic/geometric progression

Display following patterns of n rows ($n > 0$), For the below examples $n = 5$? For each pattern write a separate algorithm/program

\$	\$	12345	12345
\$\$	\$\$	1234	1234
\$\$\$	\$\$\$	123	123
\$\$\$\$	\$\$\$\$	12	12
\$\$\$\$\$	\$\$\$\$\$	1	1

Display the first n ($n > 0$) terms of the fibonacci sequence

Display the first n ($n > 0$) terms of the Tribonacci sequence

Given two positive integer numbers $n1$ and $n2$ check if the numbers are consecutive numbers of the fibonacci sequence

Compute approximate value of π considering first n ($n > 0$) terms of the Taylor series for π

Compute approximate value of e^x considering first n ($n > 0$) terms of the Taylor series for e^x

Compute approximate value of $\sin(x)/\cos(x)$ considering first n ($n > 0$) terms of the Taylor series for $\sin(x)/\cos(x)$

MODULE II:

Extract digits of an integer number (left to right and right to left)

Given a sequence of digits form the number composed of the digits. Use sentinel-controlled repetition to read the digits followed by -1. For example, for the input 2 7 3 2 9 -1 the output number is 27329

Check if a given positive integer number is a palindrome or not

Compute character grade from the marks ($0 \leq \text{marks} \leq 100$) of a subject. Grading Scheme: 80-100: A, 60 - 79: B, 50 - 59: C, 40-49: D, 0-39: F. Solve this using both else-if ladder and switch case?

Compute the sum of a sequence of numbers entered using sentinel-controlled repetition

Extract digits of an integer number (left to right and right to left)

Check if a given positive integer number is a prime number or not

Compute prime factors of a positive integer number

Check if two positive integer numbers are amicable numbers or not

Check if a given positive integer number is a perfect number or not

Check if a given positive integer number Armstrong number or not

Converting a positive integer number ($n > 0$) from one base (inputBase) to another base (outputBase) ($2 \leq \text{input Base}$, $\text{outputBase} \leq 10$). Input number should be validated before converting to make sure the number uses only digits allowed in the input base

Write a program to display a number in text form. For example: If the number is 5432 the output should be "FIVE FOUR THREE TWO"

Using the grading scheme described in the question 4 (MODULE III), Compute how many students awarded each grade and display the frequency as a bar chart (horizontal) using single "*" for each student. Use sentinel-controlled repetition (-1 as sentinel value) in reading the students marks. Use else-if ladder/switch case to compute the grade and the corresponding frequency.

Compute Body mass index (BMI), where

$\text{BMI} = \text{weight\_inKGs} / \text{Height\_inMeters} * \text{Height\_inMeters}$

Both weight and height values are positive real numbers. Your program should display BMI value followed by whether the person is Underweight, Normal, Overweight or Obese using the below ranges:

BMI Values

Underweight: less than 18.5

Normal: ≥ 18.5 and < 25

Overweight: ≥ 25 and < 30

Obese: ≥ 30

MODULE III:

Design a modularized algorithm/program to check if a given positive integer number is a circular prime or not

Design a modularized algorithm/program to compute a maximum of 8 numbers

Design a modular algorithm/program which reads an array of n integer elements and outputs mean (average), range (max-min) and mode (most frequent elements)

Design a modular algorithm/program which reads an array of n integer elements and outputs median

Implement your own string length and string reversal functions

Design algorithm/program to perform matrix operations addition, subtraction and transpose

Write a recursive program to count the number of digits of a positive integer number

Recursive solutions for the following problems:

Factorial of a number

Display digits of a number from left to right (and right to left)

Compute x^y using only multiplication

Mapping of COs to Modules

Course Outcomes	Module I	Module II	Module III
CO1	H	M	H
CO2	H	H	H
CO3		M	H
CO4	M	H	H
CO5	M	H	H

AIK107T: Indian Knowledge System
(2 Credits - 30 Hours) (L-T-P: 2-0-0)

Course Objectives

- * To introduce fundamentals of Ancient Indian Educations to understand the pattern and purpose of studying vedas, vedangas, upangas, upveda, purana & Itihasa
- * To help students to trace, identify and develop the ancient knowledge systems.
- * To help to understand the apparently rational, verifiable and universal solution from ancient Indian knowledge system for the holistic development of physical, mental and spiritual wellbeing
- * To build in the learners a deep-rooted pride in Indian knowledge, committed to universal human right, well-being and sustainable development.

Course Outcomes

After completing the course, the students will be able to:

- CO1:** Identify the foundational elements of Bhāratiya civilization, including its knowledge systems, educational institutions, and philosophical traditions. (*Understanding*)
- CO2:** Apply traditional Indian approaches to language, logic, measurement systems, and physical reality to modern interdisciplinary contexts. (*Applying*)
- CO3:** Analyse the contributions of key scholars and literary figures in the development of Indian arts, sciences, and philosophy. (*Analysing*)
- CO4:** Evaluate the scientific principles and technological innovations from ancient India in the areas of mathematics, astronomy, medicine, and environmental studies. (*Evaluating*)

Detailed Syllabus

Module-I: Foundations of Indian Knowledge Systems and Civilisational Heritage

Bhāratiya Civilization and Development of Knowledge System (4 hours)

Genesis of the land, Antiquity of civilization, On the Trail of the Lost River, Discovery of the Saraswatī River, the Saraswatī-Sindhu Civilization, Traditional Knowledge System, The Vedas, Main Schools of Philosophy, Ancient Education System, the Takṣaśilā University, the Nālandā University, Alumni, Knowledge Export from Bhārata.

Arts, Literature, and Scholars (3 hours)

Art, Music, and Dance, Naṭarāja– A Masterpiece of Indian Art, Literature, Life and works of Agastya, Lopāmudrā, Vālmīki, Patañjali, Vedavyāsa, Yājñavalkya, Gārgī, Maitreyī, Bodhāyana, Caraka, Suśruta, Jīvaka, Nāgārjuna, Kaṇāda, Patañjali, Kauṭīlya, Pāṇini, Āryabhaṭa, Varāhamihira, Ādi Śaṅkarācārya, Bhāskarācārya, Mādhavācārya.

Science, Astronomy, and Mathematics (5 hours)

Concept of Matter, Life and Universe, Gravity, Sage Agastya's Model of Battery, Velocity of Light, Vimāna: Aeronautics, Vedic Cosmology and Modern Concepts, Bhāratiya Kāla-gaṇanā, Kerala School for Mathematics and Astronomy, History and Culture of Astronomy, Sun, Earth, Moon, and Eclipses, Earth is Spherical and Rotation of Earth, Archaeoastronomy; Concepts of Zero and Pi, Number System, Pythagoras Theorem, and Vedic Mathematics.

Life, Environment, and Health (3 hours)

Ethnic Studies, Life Science in Plants, Anatomy, Physiology, Agriculture, Ecology and Environment, Āyurveda, Integrated Approach to Healthcare, Medicine, Microbiology, Medicine, Surgery, and Yoga, etc.

Module-II: Scientific Traditions and Technological Innovations in Indian Knowledge Systems

Foundation concept for Science & Technology (7 hours)

Linguistics & Phonetics in Sanskrit (panini's), Computational concepts in Astadhyayi Importance of Verbs, Role of Sanskrit in Natural Language Processing, Number System and Units of Measurement, concept of zero and its importance, Large numbers & their representation, Place Value of Numerals, Decimal System, Measurements for time, distance and weight, Unique approaches to represent numbers (Bhūta Saṃkhyā

System, Kaṭapayādi System), Pingala and the Binary system, Knowledge Pyramid, Prameya – A Vaiśeṣikan approach to physical reality, constituents of the physical reality, Pramāṇa, Saṃśaya.

Indian Science & Technology in IKS (8 hours)

Pre-Harappan and Sindhu Valley Civilization, Laboratory and Apparatus, Juices, Dyes, Paints and Cements, Glass and Pottery, Engineering Science and Technology in the Vedic Age and Post-Vedic Records. Indian Science and Technology Heritage, sixty-four art forms and occupational skills (64 Kalas). Metals and Metalworking technology: Copper, Gold, Zinc, Mercury, Lead, Silver, Iron & Steel. Dyes and Painting Technology, Town & Planning Architecture in India, Temple Architecture, Vastu Sastra.

CAGE106T: GENERAL ENGLISH - I **(2 credit: 30 hours) (L-T-P: 1-1-0)**

Course Objective:

The course aims to strengthen the foundational skills of English language learning by developing competence in listening, speaking, reading, and writing. It focuses on improving vocabulary, grammar, writing style, and oral communication through structured modules, practice sessions, and applied tasks, thereby enabling learners to enhance both academic and Discipline Specific communication skills.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1: Provide learning environment to practice listening, speaking, reading and writing skills. (*Applying, Analyzing*)
- CO2: Assist students to carry on the tasks and activities through guided instructions and materials. (*Understanding, Applying*)
- CO3: Effectively integrate English language learning with employability skills and training. (*Applying, Evaluating*)
- CO4: Provide hands-on experience through case-studies, mini-projects, group and individual presentations. (*Creating, Evaluating*)

Course Content:**Module I: Vocabulary Building (5 Hours)**

The concept of Word Formation, Root words from foreign languages and their use in English, Acquaintance with prefixes and suffixes from foreign languages in English to form derivatives, Synonyms, antonyms, and standard abbreviations.

Module II: Basic Writing Skills (6 Hours)

Sentence Structures, Use of phrases and clauses in sentences, Importance of proper punctuation, Creating coherence, Organizing principles of paragraphs in documents, Techniques for writing precisely

Module III: Identifying Common Errors in Writing (5 Hours)

Subject-verb agreement, Noun-pronoun agreement, Misplaced modifiers, Articles, Prepositions, Redundancies

Module IV: Nature and Style of sensible Writing (6 Hours)

Describing, Defining, Classifying, providing examples or evidence, writing introduction and conclusion, Module V: Writing Practices, Comprehension, Précis Writing, Essay Writing

Module V: Oral Communication (This Module involves interactive practice sessions in Language Lab) (8 Hours)

Listening Comprehension, Pronunciation, Intonation, Stress and Rhythm, Common Everyday Situations: Conversations and Dialogues, Communication at Workplace, Interviews, Formal Presentations

CBES101T: ENVIRONMENTAL STUDIES
(1 credit: 15 hours) (L-T-P: 1:0:0)

Course Objective:

The course aims to create awareness and a holistic understanding of the environment by introducing students to its multidisciplinary nature, natural resources, ecosystems, biodiversity, environmental pollution, and social issues. It seeks to instill ecological literacy, promote sustainable practices, and develop a sense of responsibility among learners to evaluate and address environmental challenges at both local and global scales.

Course Outcomes:

After successful completion of this course, students will be able to:

- CO1: Recall the multidisciplinary nature of environmental studies. (*Remembering*)
- CO2: Explain ecological processes of natural resources. (*Understanding*)
- CO3: Categorize different types of natural resources. (*Analysing*)
- CO4: Evaluate the global scale of environmental pollution. (*Evaluating*)

Module I: The Multidisciplinary Nature of Environmental Studies (1 Hour)

Definition, scope and importance, need for public awareness.

Module II: Natural Resources (2 Hours)

- a. Different types of natural resources and associated problems - forest resources, water resources, mineral resources, food resources, energy resources and land resources.
- b. Conservation of natural resources.

Module III: Ecosystems (2 Hours)

- a. Concept of an ecosystem, structure and function of an ecosystem, producers, consumers and decomposers, energy flow in the ecosystem, food chains, food webs.
- b. Structure of following ecosystems - forest ecosystem, grassland ecosystem, desert ecosystem, aquatic ecosystems.

Module IV: Biodiversity and Its Conservation (2 Hours)

Types of biodiversity – genetic, species and ecosystem, value of biodiversity, global biodiversity, India as a mega-diversity nation, threats to biodiversity, conservation of biodiversity - in-situ and ex-situ conservation.

Module V: Environmental Pollution (3 Hours)

- a. Definition, causes, effects and control measures of - air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, nuclear hazards and e-pollution.
- b. Solid waste management.
- c. Disaster management.

Module VI: Social Issues and the Environment (3 Hours)

- a. From unsustainable to sustainable development, urban problems related to energy, water conservation, rain water harvesting, climate change, global warming, acid rain, ozone layer depletion.
- b. Environment protection act.
- c. Introduction to environmental impact assessment.

Module VII: Human Population and the Environment (2 Hours)

Population growth and sex ratio; Population explosion - family welfare programme; Environment and human health; HIV/AIDS; Role of information technology in environment and human health.

Suggested Readings

AECH100T: COMMUNICATIVE HINDI - I**(2 credits – 30 hours) (L-T-P: 2-0-0)****Course Outcomes**

After successful completion of this course, students will be able to:

- CO1: Grasp the basic script of Devnagari for communicative usage (Remembering)
- CO2: Learn the vocabulary, grammar and sentence formation for day-to-day communication in Hindi (Understanding)
- CO3: Use the vocabulary, idiom and proverbs in communicative Hindi writing (Applying)
- CO4: Understand Hindi used in common public places & offices as National Language (Applying)

Course Content**Module I: Introduction to Hindi language and pronunciation**

Introduction to evolution of Hindi as National language of connectivity

Introduction to Hindi alphabet (Devanagari script) - vowels and consonants with their pronunciation

Basic greetings and expressions

- ✓ हिंदी भाषा का राष्ट्रीय भाषा के रूप में उत्थान: परिचयात्मक विश्लेषण
- ✓ हिंदी बारह बड़ी (देवनागरी लिपि) का ज्ञान – स्वर, व्यंजन एवं उनका उच्चारण
- ✓ सामान्य शब्दभंडार एवं उद्बोधन ज्ञान

Module II: Vocabulary building and basic sentence formation

Vocabulary building for daily use

Basic sentence formation using simple verbs and nouns

Introduction to daily inter personal communications / asking questions/ daily use conversations

- ✓ दैनिक प्रयोग की शब्दावली एवं शब्दकोष का ज्ञान
- ✓ संज्ञा एवं क्रिया के उपयोग से सामान्य वाक्यों की संरचना
- ✓ दैनिक उपयोगी सम्बोधन, स्व-सम्बोधन, प्रश्न इत्यादि पूछना एवं सामान्य बोलचाल सम्बन्धी ज्ञान

Module III: Basic level conversational practice and grammar

Introduction to Hindi grammar: noun, pronoun, adjective, verb, adverb

Sentence formation using different tenses: present, past, future

Use of prepositions and conjunctions in sentences

Role-play exercises for different situations: shopping, ordering food, asking for directions, etc.

Group discussion and conversation practice for grammar, sentence formation and effective communication in Hindi

- ✓ हिंदी व्याकरण – संज्ञा, सर्वनाम, विशेषण, क्रिया, क्रिया-विशेषण इत्यादि
- ✓ विभिन्न काल सम्बन्धी वाक्य संरचना – वर्तमान, भविष्य एवं भूत काल
- ✓ संबंध सूचक अव्यय / पूर्वसर्ग / शब्द एवं समुच्चयबोधक / संयोजक शब्द – वाक्य संरचना में उनका उपयोग

- ✓ अभिनय-नाटक / वार्तालाप गतिविधि / नाटक रचना के माध्यम से विभिन्न दैनिक परिस्थितियों के वार्तालाप का ज्ञान – दैनिक खान-पान सम्बन्धी, खरीददारी सम्बन्धी, पता-ठिकाना / दिशा सम्बन्धी इत्यादि
- ✓ सामूहिक परिचर्चा एवं वार्तालाप के माध्यम से व्याकरण के उपयोग, वाक्य संरचना एवं प्रभावी वार्तालाप का ज्ञान तथा अभ्यास

Module IV: Intermediate level vocabulary and grammar

- a. Vocabulary building for intermediate level topics: travel, health, environment, etc.
- b. Intermediate level sentence formation: complex sentences, conditional sentences, etc.
- c. Idioms & proverbs and their usage in communication
 - ✓ माध्यमिक स्तर के वार्तालाप हेतु शब्दावली निर्माण जैसे यात्रा, स्वास्थ्य, वातावरण इत्यादि क्षेत्रों में उपयोगी शब्दावली का ज्ञान
 - ✓ माध्यमिक स्तर के वार्तालाप हेतु वाक्य संरचना का ज्ञान: संयुक्त वाक्य, उपबंध वाची वाक्य इत्यादि
 - ✓ दैनिक वार्तालाप तथा उपयोग में आने वाली कहावतों एवं मुहावरों का ज्ञान

Module V: Advanced level conversation and writing practice

Advanced conversation practice on different Discipline Specific topics

Writing practice: Paragraph writing, message writing, letter writing, essay writing, etc.

- ✓ विभिन्न कार्यकारी क्षेत्रों से सम्बंधित उच्च स्तरीय वार्तालाप का ज्ञान एवं अभ्यास
- ✓ लेखन अभ्यास: पत्र लेखन, सन्देश, निबंध, अनुच्छेद / वाक्यखंड लेखन इत्यादि

AECA100T: COMMUNICATIVE ASSAMESE I

(2 Credits: 30 hours) (L-T-P: 2-0-0)

Course Objectives

To give basic idea about the Assamese Language alphabets, wordings and also to make them learn about sentence formation, tense and writing skills of Assamese

Course Outcomes

After successful completion of this course, students will be able to:

- CO1: Understand the basic concept of Assamese language. (*Understanding*)
- CO2: Remembering the conversational language. (*Remembering*)

CO3: Analyse the reading skills of Assamese. (*Analysing*)

CO4: Apply the writing skills in daily life activities. (*Applying*)

Module I: Introduction to Assamese language and pronunciation (8 Hours)

History and geography of Assam; Introduction to Assamese alphabet and pronunciation of vowels and consonants; Basic greetings and expressions

Module II: Vocabulary building and basic sentence formation (8 Hours)

Vocabulary building for daily use; Basic sentence formation using simple verbs and nouns; Introducing oneself and asking questions

Module III: Grammar Basics and Conversational Practice (6 Hours)

Introduction to Assamese grammar: noun, pronoun, adjective, verb, adverb; Sentence formation using different tenses: present, past, future; Use of prepositions and conjunctions

Role-play exercises for different situations: shopping, ordering food, asking for directions, etc.; Group discussion and conversation practice

Module IV: Intermediate level vocabulary and basic writing practice (8 Hours)

Vocabulary building for intermediate level topics: travel, health, environment, etc.; Intermediate level sentence formation: complex sentences, conditional sentences, etc.

Use of idioms and proverbs; Advanced conversation practice on different topics; Writing practice: letter writing, essay writing, etc.

Project Phase-I: Group discussion, project identification; Case study along with group discussion

- ৪) অসমীয়া বাক্যৰ লেখক সতানাত্ৰ বৰা।
- ৫) অসমীয়া কুইজ পাঠ- কুৰ্বেৰ পৰিচালন।
- ৬) অকন হাইন- কুৰ্বেৰ পৰিচালন, শ্ৰী বাবুল শৰ্মা।

AEFR100T: FRENCH BEGINNER LEVEL I

(2 credits – 30 hours) (L-T-P: 2-0-0)

Course Objective

French Beginner level I is a course of 30 learning hours designed to help learners to acquire basic speaking, listening, writing and reading skills in French. The course introduces pronunciation, common vocabulary and basic grammar to learners with no previous knowledge of French language. This knowledge prepares students to effectively communicate in French on topics related to everyday situations. Students practice listening and speaking in real-life situations, learn to read short and practical texts in French, and gain an insight into francophone cultures. By the end of the session, learners are expected to be able to engage in some general, everyday types of conversation.

Course Outcomes

After successful completion of this course, students will be able to:

- CO1: Recall, name and identify the vocabulary and phrases related to who, when, where and other key question words, explain and interpret their meanings and select appropriate response. (*Remembering, Analyzing, Evaluating*)
- CO2: Use the vocabulary and sentence structures learned to converse and discuss on a range of topics related to everyday situations. (*Understanding, Applying*)
- CO3: Demonstrate a basic understanding of francophone countries' cultures, describe and summarize basic cultural values. (*Applying, Understanding, Evaluating*)

- CO4: Analyse cultural differences and choose appropriate ways to interact with speakers from Franco-phone countries. (*Analysing, Evaluating*)
- CO5: Design and compose meaningful situational dialogues and perform them; invent skits by using the language skills learned. (*Creating*)

Course Content:

Module I: Introduction to French phonetics and pronunciation drills (8 hours)

Phonetic alphabet; Vowels, semi-vowels and consonants; Silent letters; Pronunciation rules

Module II: Everyday common phrases and basic sentence structures (16 hours)

Greeting; Self-introduction (nationality, profession, age, family); Making requests
Talking about one's likes and dislikes; Making invitation; Describing personnel

Module III: Introduction to Francophone cultures (6 hours)

French and its speakers; Pop culture: music, movies, TV, dramas; Lifestyles

Suggested Readings

AEGR100T: Introduction to German Language I (2 credits – 30 hours) (L-T-P: 2-0-0)

Course Objective

The course aims at covering the basics of German language. It also covers a few basic grammar topics and an application of grammar in day-to-day life that is in reading, writing, listening, and speaking. On the completion of the first semester, one can understand and use familiar, everyday expressions and very simple sentences, can introduce him/her and others as well as ask others about themselves – e.g., where they live, who they know and what they own – and can respond to questions of this nature.

Course Outcomes

After successful completion of this course, students will be able to:

- CO1: Demonstrate the ability to use basic German vocabulary and grammar (personal pronouns, articles, verbs, negation, and prepositions) for everyday communication. (*Understanding, Applying*)
- CO2: Engage in simple conversations by introducing oneself, discussing family, occupations, hobbies, food, travel, and time-related contexts in German. (*Applying, Analysing*)
- CO3: Interpret and construct short dialogues and written expressions using correct sentence structures (nominative/accusative, possessive articles, expressions of time) to communicate effectively in familiar situations. (*Applying, Creating*)

Course Content

	Topic	Grammar
1	Greetings	Personal pronouns and verbs in the present tense
2	Introduce yourself/countries/occupations/Family	Artikel: der/die/das
3	The alphabet and the numbers	Verbs
4	Languages and countries	The negation
5	People and hobbies	Expression of time (am, um, von..bis)
6	In the city	Possessive Artikel
7	Food and drink and in the restaurant	Nominative and Accusative sentences, verbs and prepositions
8	Time and season	

Suggested Reading

Netzwerk Deutsch als Fremdsprache A1, Textbook + Workbook by Stephanie Dengler

SEMESTER –II**CAMF111T: Mathematical Foundation of Computer Science – II**

(3 credits - 45 hours) (L-T-P: 3-0-0)

Course Objective:

The course aims to provide students with a strong mathematical foundation essential for advanced studies in computer science. It focuses on developing rigorous analytical and logical reasoning skills, enabling students to construct valid arguments and proofs. Through exposure to key topics such as logic, algebraic structures, numerical methods, and optimization techniques, the course builds the ability to apply mathematical concepts to computational and real-world problem-solving scenarios. By integrating theoretical understanding with practical applications, it prepares students to model, analyze, and optimize complex systems in the field of computer science.

Course Outcomes

After successful completion of this course, students will be able to:

- CO1: Construct valid arguments and proofs using appropriate logical and mathematical reasoning. *(Creating)*
- CO2: Apply fundamental mathematical techniques to understand and implement advanced computational methods, including numerical and optimization algorithms. *(Applying)*
- CO3: Employ effective problem-solving strategies to address both theoretical and practical challenges in computer science. *(Applying, Analyzing)*

Course Content:

Module I: Logic and Methods of Proofs (14 Hours)

Propositions, logical operations (basic connectives), compound statements, construction of truth table, quantifiers, conditional statements, tautology, contradiction, contingency, logical equivalence. Conjunctive Normal Forms (CNF) and Disjunctive Normal Forms (DNF).

Methods of proofs: Rules of inference for propositional logic, modus ponens, modus tollens, syllogism, proof by contradiction, Mathematical Induction.

Module II: Algebraic Structures: (8 Hours)

Semi-group, Monoid, Group, Subgroup, Cyclic group.

Module III: Numerical Methods: (12 Hours)

Concept and importance of errors in numerical methods.

Solution of algebraic and transcendental equations: Bisection method and Newton-Raphson methods.

Numerical Interpolation: Newton's Forward and Newton's Backward interpolation formula and Lagrange's formula.

Numerical Integration: Trapezoidal rule and Simpson's 1/3 rule

Only formula and problem solving for all the topics mentioned above.

Module IV: Optimization Techniques: (11 Hours)

Linear programming: Introduction, LP formulation, Graphical method for solving LPs with two variables, Special cases in graphical methods, Simplex method, Duality.

Transportation problem: Definition, Linear form, North-west corner method, least cost method, Vogel's approximation method for finding feasible solution, MODI method for finding optimum solution.

CADS112T: Data Structures

(3 credits - 45 hours) (L-T-P: 3-0-0)

Course Objective:

The objective of this course is to develop a strong foundation in the concepts, design, and implementation of fundamental data structures. Students will learn how various linear and nonlinear data structures operate, how they are stored and manipulated in memory, and how they support efficient algorithmic problem-solving. The course emphasizes analytical thinking, algorithmic efficiency, and hands-on implementation using the C programming language, enabling students to choose and apply appropriate data structures for solving computational problems effectively.

Course Outcomes:

After successful completion of this course, students will be able to:

CO1: Understand the fundamental concepts, operations, and applications of various data structures.

(Understanding)

CO2: Apply suitable data structures and algorithmic techniques to solve computational problems. (Applying)

CO3: Implement linear and nonlinear data structures using the C programming language. (Applying)

Prerequisite:

Programming Fundamentals: Understanding the basic syntax and semantics of C programming language.

Problem-Solving Skills: Ability to break down a problem into smaller steps and devise a step-by-step solution and familiarity with simple algorithms.

Course Content:

Module I: (12 Hours)

Introduction and Overview: Definition, Classification and Operations of Data Structures. Algorithms: Complexity, Time-Space Tradeoff

Arrays: Definition and Classification of Arrays, Representation of Linear Arrays in Memory, Operations on Linear Arrays: Traversing, Inserting, Deleting, Searching, Sorting and Merging. Searching: Linear Search and Binary Search, Comparison of Methods. Sorting: Bubble Sort, Selection Sort, and Insertion Sort. Two-Dimensional Arrays, Representation of Two- Dimensional Arrays in Memory, Matrices and Sparse Matrices, Multi-Dimensional Arrays.

Module II: (10 Hours)

Linked Lists: Definition, Comparison with Arrays, Representation, Types of Linked lists, Traversing, Inserting, Deleting and Searching in Singly Linked List, Doubly Linked List and Circular Linked List. Applications of Linked Lists: Addition of Polynomials.

Hashing and Collision: Hashing, Hash Tables, Types of Hash Functions, Collision, Collision Resolution with Open Addressing and Chaining

Module III: (12 Hours)

Stacks: Definition, Representation of Stacks using Arrays and Linked List, Operations on Stacks using Arrays and Linked List, Application of Stacks: Arithmetic Expressions, Polish Notation, Conversion of Infix Expression to Postfix Expression, Evaluation of Postfix Expression.

Recursion: Definition, Recursive Notation, Runtime Stack, Applications of Recursion: Factorial of Number, GCD, Fibonacci Series and Towers of Hanoi.

Queues: Definition, Representation of Queues using Array and Linked List, Types of Queue: Simple Queue, Circular Queue, Double-Ended queue, Priority Queue, Operations on Simple Queues and Circular Queues using Array and Linked List, Applications of Queues.

Module IV: (11 Hours)

Graphs: Definition, Terminology, Representation, Traversal.

Trees: Definition, Terminology, Binary Trees, Traversal of Binary Tree, Binary Search Tree, Inserting, Deleting and Searching in Binary Search Tree, Height Balanced Trees: AVL Trees, Insertion and Deletion in AVL Tree.

CADS113P: Data Structures Lab
(1 credit - 30 hours) (L-T-P: 0-0-1)

Course Objective:

The objective of this lab course is to enable students to apply and implement fundamental data structures using the C programming language. Through hands-on exercises, students will develop practical skills in designing, coding, debugging, and analyzing data structure operations. The lab reinforces concepts learned in theory and prepares students to choose appropriate data structures for effective problem-solving in real-world applications.

Course Outcomes:

After successful completion of the lab course, students will be able to:

CO1: Implement basic and advanced operations on linear and nonlinear data structures using C. (Applying)

CO2: Analyze the behavior and performance of data structure operations through practical experimentation. (Analyzing)

CO3: Develop efficient solutions to computational problems by selecting and integrating appropriate data structures. (Applying/Creating)

List of Lab Programs:

Module I: Array and Matrix Operations: (10 Hours)

Insertion and deletion in arrays; Linear search and binary search; Bubble sort and selection; Merging of arrays; Addition, subtraction, and multiplication of matrices

Module II: Linked List Implementations (10 Hours)

Singly Linked List - Insertion: beginning, end, specific position; Deletion: beginning, end

Doubly Linked List – Create, Search

Circular Linked List – Create, Delete from end

Module III: Stacks and Queues (5 Hours)

Stacks - Implement stack using array; Implement stack using linked list

Queues - Simple queue using array; Circular queue using array

Module IV: Trees and Binary Search Trees (5 Hours)

Traversals: preorder, inorder, postorder

CAOS114T: Operating Systems

(3 credits - 45 hours) (L-T-P: 3-0-0)

Course Objective:

The primary objective of this course is to introduce students to the fundamental concepts, design principles, and functioning of modern operating systems. The course aims to build a strong understanding of process management, CPU scheduling, memory management, I/O handling, synchronization, and file systems, enabling students to analyze, compare, and apply operating system functionalities effectively.

Course Outcomes:

At the end of the course, students will be able to:

CO1: Explain the fundamentals of the operating system. (*Understanding*)

CO2: Comprehend multithreaded programming, CPU scheduling, process management, process synchronization, memory, deadlocks, and storage management. (*Understanding, Applying*)

CO3: Compare the performance of CPU scheduling algorithms (*Analyzing, Evaluating*)

CO4: Identify the features of I/O and File handling methods. (*Remembering / Understanding*)

Course Content:**Module I: (10 Hours)**

Operating Systems Overview: Definition, Evaluation of O.S, Components & Services of OS, Structure, Architecture, types of Operating Systems, Batch Systems, Concepts of Multiprogramming and Time Sharing, Parallel, Distributed and real time Systems.

Operating Systems Structures: Operating system services and systems calls, system programs, operating system structure, operating systems generations.

Module II: (12 Hours)

Process Management: Process Definition, Process states, Process State transitions, Process Scheduling, Process Control Block, Threads, Concept of multithreads, Benefits of threads, Types of threads.

Process Scheduling: Definition, Scheduling objectives, Scheduling algorithms, CPU scheduling Preemptive and Non-preemptive Scheduling algorithms (FCFS, SJF and RR), Performance evaluation of the scheduling Algorithms

Module III: (10 Hours)

Process Synchronization: Introduction, Inter-process Communication, Race Conditions, Critical Section Problem, Mutual Exclusion, Semaphores, Monitors.

Deadlocks: System model, deadlock characterization, deadlock prevention, avoidance, Banker's algorithm, Deadlock detection, and recovery from deadlocks.

Module IV: (13 Hours)

Memory Management: Logical and Physical address map, Swapping, Memory allocation, MFT, MVT, Internal and External fragmentation and Compaction, Paging, Segmentation.

Virtual Memory: Demand paging, Page Replacement algorithms, Allocation of frames, thrashing.

I/O Management: Principles of I/O Hardware: Disk structure, Disk scheduling algorithms.

Text Books:

1. Ekta Walia, Operating Systems Concepts, Khanna Publishing House, 2022 (AICTE Recommended Textbook)
2. Abraham Silberschatz, Peter Baer Galvin, Greg Gagne (2006), Operating System Principles, 7th edition OR Later edition, Wiley India Private Limited, New Delhi.
3. Stallings (2006), Operating Systems, Internals and Design Principles, 5th edition, Pearson Education, India.

Reference Books:

1. Andrew S Tanenbaum, Modern Operating Systems, Third Edition, Prentice Hall India.
2. Sumitabha Das, UNIX Concepts and Applications, 4th Edition, Tata McGraw-Hill.

Mapping of COs to Modules

CAOS115P: Operating Systems Lab
(1 credit - 30 hours) (L-T-P: 0-0-1)

Course Objective:

The objective of this laboratory course is to provide hands-on experience with operating system concepts such as CPU scheduling, process synchronization, inter-process communication, deadlock avoidance, memory management, file allocation, and page replacement. Students will learn to implement core OS algorithms using C programming, enhancing their understanding of internal OS mechanisms.

Course Outcomes (COs):

At the end of the course, students will be able to:

- CO1: Implement CPU scheduling algorithms. *(Applying)*
- CO2: Understand and demonstrate solutions for critical section problems. *(Understanding, Applying)*
- CO3: Apply concepts of memory and file allocation techniques. *(Applying)*
- CO4: Implement and compare page replacement algorithms. *(Applying, Analyzing)*

Course Content:

Module I: Process Scheduling, Synchronization & IPC (15 Hours)

- Write a C program to simulate the FCFS CPU Scheduling algorithm.
- Write a C program to simulate the SJF CPU Scheduling algorithm.
- Write a C program to simulate the Round Robin (RR) CPU Scheduling algorithm.
- Write a C program to simulate Banker's Algorithm for deadlock avoidance.
- Write a C program to implement the Producer–Consumer problem using semaphores.
- Write a C program to illustrate IPC mechanism using Pipes.
- Write a C program to illustrate IPC mechanism using FIFOs.
- Write a C program to simulate the Dining Philosophers problem.

Module II: Memory Management, Page Replacement & File Allocation (15 Hours)

- Write a C program to simulate Paging memory management technique.
- Write a C program to simulate Segmentation memory management technique.
- Write a C program to simulate the Best Fit memory allocation technique.
- Write a C program to simulate the First Fit memory allocation technique.
- Write a C program to implement FIFO page replacement technique.
- Write a C program to implement Sequential file allocation method.

CAOP116T: Object Oriented Programming using Java
(2 credits - 30 hours) (L-T-P: 3-0-0)

Course Objective:

The objective of this course is to introduce students to the foundational principles of object-oriented programming, Java syntax and semantics, modular program development, and the use of JDK for creating, debugging, and executing Java applications.

Course Outcomes:

At the end of the course, students will be able to:

CO1: Describe the fundamental concepts of Object-Oriented Programming. (*Remembering, Understanding*)

CO2: Apply basic Java syntax to write simple programs. (*Applying*)

CO3: Use classes, objects, methods, and arrays to develop small modular Java programs. (*Applying*)

CO4: Set up and use the JDK environment to compile and run Java programs. (*Applying*)

Prerequisite: Knowledge of Problem Solving Techniques using C programming language

Course Content:

Module I: OOP Basics and Java Fundamentals (15 Hours)

Fundamentals of Object-Oriented Programming: Basic Concepts of Object-Oriented Programming (OOP) - objects, classes, abstraction, encapsulation, inheritance, polymorphism (overview only); Benefits and applications of OOP.

Java Basics: Java Features, Difference between Java, C and C++, Java Environment, structure of a simple Java Program, compiling & executing using command line; Java tokens - identifiers, keywords, literals, operators, separators; Variables, constants, data types, typecasting

Control Structures: Decision Making with Control Statements, Looping statements, Jump in loops, Labelled loops.

Module II: Classes, Methods, Arrays & Basic Packages (15 Hours)

Classes and Objects: Defining classes, creating objects, member methods, constructors, method overloading (only)

Arrays and Strings: 1D and 2D arrays, simple String operations

Inheritance: Simple Single Inheritance

Packages: Basics of packages, Creating user defined packages

CAOP117P: Object Oriented Programming using Java Lab
(1 credit - 30 hours) (L-T-P: 0-0-1)

Course Objective:

The objective of this lab course is to provide hands-on experience in writing, compiling, and executing Java programs while applying basic object-oriented concepts and handling simple program structures.

Course Outcomes:

At the end of the course, students will be able to:

- CO1: Apply basic Java syntax to develop simple programs. (Applying)
- CO2: Implement classes, objects, and basic OOP concepts in Java. (Applying)
- CO3: Use arrays, strings, and methods to write modular Java programs. (Applying)
- CO4: Handle simple exceptions during program execution. (Applying)

Module I: Basic Java & OOP Foundations (15 hours)

- Write a program to read two numbers and print their product.
- Write a program to print the square of a number using command-line arguments.
- Write a program to find the largest number among n numbers.
- Write a program to generate Fibonacci series and factorial (recursive & non-recursive).
- Write a program to check whether a given string is a palindrome.
- Write a program to sort a list of names in ascending order.
- Write a program to multiply two matrices.
- Write a program to read n values in an array and display them in reverse.

Module II: Classes, Inheritance & Exception Handling (15 hours)

- Program with classes AddSub (add, subtract) and derived class MulDiv (multiply, divide).
- Create a *Student* class (USN, Name, Branch, Phone, Percentage) and create n objects.
- Program with class Shape and subclass Circle overriding getArea() and getPerimeter().
- Program with Employee as base class and subclasses Manager and Programmer overriding calculateSalary().
- Program using an interface Bank with implementations SBI and PNB printing rates of interest.
- Program demonstrating divide-by-zero exception handling.
- Program that throws an UnderAge exception if age < 18 and handles it in main().

CO4	L	H

CAWT118T: Web Technologies
(2 credits - 30 hours) (L-T-P: 2-0-0)

Course Objective:

The objective of this course is to introduce students to fundamental web technologies, including HTML, CSS, JavaScript, and XML, enabling them to design and develop responsive, interactive, and modern web applications.

Course Outcomes:

At the end of the course, students will be able to:

- CO1: Understand the concepts and architecture of the WWW, markup languages, and CSS. (*Understanding*)

- CO2: Apply event handling and data validation techniques using JavaScript. (*Applying*)
 CO3: Understand client-side dynamic scripting and basic full-stack concepts. (*Understanding*)
 CO4: Develop simple, responsive, and interactive web applications. (*Applying / Creating*)

Course Content:**Module I: Basics of HTML and CSS (15 Hours)**

Basics of HTML: Introduction to Web browsers, WWW, protocols and HTML, history of HTML, basic Structures of HTML, Header Tags, body tags, Paragraph Tags; Tags for TABLE, FORM, TEXTAREA, SELECT, IMG, IFRAME FIELDSET, ANCHOR; Lists in HTML, Introduction to DIV tag, NAVBAR Design, Introduction to XHTML

Introduction to CSS: Types of CSS, Selectors, and Responsiveness of a web page; Background, text and font properties; table and list properties; Introduction to Bootstrap

Module II: JavaScript Basics and XML (15 Hours)

Introduction to JavaScript: Functions and Events, Document Object model traversing using JavaScript. Output System in JavaScript i.e. Alert, throughput, Input box, Console. Variables and Arrays in JavaScript. Date and String handling in JavaScript.

Manipulating CSS through JavaScript: Form Validation like Required validator, length validator, Pattern validator. Advanced JavaScript, Combining HTML, CSS and JavaScript events and buttons, controlling your browser

Introduction to XML: Uses, Key concepts, DTD & schemas, XSL, XSLT, and XSL Elements and transforming with XSLT.

CAWT119P: Web Technologies Lab
(1 credit - 30 hours) (L-T-P: 0-0-1)
Course Objective:

The objective of this course is to provide hands-on experience in creating static and interactive web pages using HTML, CSS, JavaScript, XML, and related web technologies. Students will learn to design responsive layouts, validate input data, work with client-side scripting, and utilize structured data formats.

Course Outcomes (COs)

At the end of the course, students will be able to:

- CO1: Design web pages using HTML and CSS. (*Applying*)
 CO2: Implement interactivity and input validation using JavaScript. (*Applying*)

CO3: Use XML, DTD, XSD, and XSLT for structured data handling. (*Understanding / Applying*)

CO4: Develop small web applications integrating HTML, CSS, JavaScript, and XML/JSON. (*Applying / Creating*)

LIST OF PROGRAMS:

Module I: HTML & CSS BASICS (15 Hours)

Create your class timetable using the HTML table tag.

Design a descriptive webpage for your college (courses, departments, library, etc.) using lists, links, and anchor tags.

Create a webpage layout using frames with rows and columns (header, left menu, right content, status bar).

Create your personal Resume using HTML text formatting, links, colours, and lists.

Design a Supermarket homepage using internal CSS.

Apply external CSS to format your timetable.

Use all CSS types (inline, internal, external) to format the college webpage designed earlier.

Create a mobile-friendly webpage for your college (responsive basic layout).

Module II: JavaScript and XML (15 Hours)

Create an HTML/JavaScript Login Page with basic validations.

Develop a Simple Calculator using JavaScript (add, subtract, multiply, divide).

Apply Regular Expressions for login form validation.

Retrieve data from a text file and display it using AJAX.

Create an XML file to store student information (Register No, Name, Mobile, DOB, Email).

Create a DTD for the XML file.

Create an XML Schema (XSD) for the XML file.

Create an XSL file to convert XML to XHTML.

Write a JavaScript program using switch case.

Write a JavaScript program using built-in objects (Date, Math, String, Array).

CBUI104T: Understanding India (1 credit - 15 hours) (L-T-P: 1-0-0)

Course Outcomes:

At the end of this course, students will be able to:

CO1: Explain the social, cultural and religious diversity of India and its impact on Indian psyche.

CO2: At the end of this course, students will be able to evaluate the political and economic system of India.

Module 1: India and its Diversity (8 hours)

Overview of India's geography, diversity, demographics and development indicators

A brief survey of India's history, highlighting key events, personalities and movements that shaped its identity and destiny

An exploration of India's rich and varied cultural heritage, including its languages, religions, arts, literature and philosophy

An overview of India's social structure, institutions, norms and values, with a focus on issues such as caste, gender, class and ethnicity

Module 2: Indian Political System (7 hours)

A study of India's political system, institutions, parties and ideologies

India's role in regional and global affairs

A review of India's economic performance; the challenges and opportunities for growth;

An overview of sectors such as agriculture, industry, services, and trade.

A discussion of India's environmental problems & the solutions for sustainable development

A discussion on India's journey towards a developed nation.

AECH101T: COMMUNICATIVE HINDI II

(2 credits – 30 hours) (L-T-P: 2-0-0)

Course Outcomes

On completion of this course successfully, students will be able to:

CO1: Conceptualize vocabulary used in professional sectors (remembering)

CO2: Apply advance level grammatical concepts in communicative usage (applying)

CO3: Understand the cultural and regional influences on communicative Hindi (understanding)

CO4: Effectively use Hindi in public, professional and social platforms

Module I: Advanced vocabulary building

Review of concepts: Review of basic level Hindi vocabulary, pronunciation and sentence formation

Review of intermediate level vocabulary, conversation and grammar

Vocabulary building for advanced topics: politics, economics, technology, etc.

Understanding and usage of synonyms, antonyms, and homonyms words

सामान्य हिंदी ज्ञान एवं अवधारणाओं की समीक्षा: शब्द कोष, उच्चारण, वाक्य संरचना इत्यादि

माध्यमिक स्तर के वार्तालाप हेतु शब्दावली, वार्तालाप व्याकरण एवं इत्यादि की समीक्षा

उच्च स्तरीय वार्तालाप हेतु शब्दकोष निर्माण जैसे राजनीति, अर्थशास्त्र, विज्ञान व तकनीकी आदि क्षेत्रों में उपयोगी शब्दावली

समानार्थी, विरुद्धार्थी एवं सामान्य शब्दों का ज्ञान एवं उपयोग

Module II: Advanced grammar concepts

Advanced sentence formation: passive voice, direct and indirect speech, etc.

Use of conjunctions, interjections, and transitional words

Figures of speech (Alankar) and their effective usage in communicative Hindi

उच्च स्तरीय वाक्य संरचना: कर्तृवाच्य और कर्मवाच्य, प्रत्यक्ष कथन और अप्रत्यक्ष कथन इत्यादि

संज्ञोक्त, विस्मयादिबोधक, सकर्मक-अकर्मक शब्दों का उपयोग

अलंकारों का ज्ञान एवं प्रभावशाली वार्तालाप में उनका प्रयोग

Module III: Conversational practice and Writing practice

Role-play exercises for advanced situations: negotiating, debating, expressing opinions, etc.

Group discussion and conversation practice

Writing practice for advanced topics: newspaper articles, book/magazine articles, reports, etc.;

rhetorical usage in Hindi writing

अभिनय-नाटक / वाद-विवाद / वार्तालाप गतिविधि / नाट्य-रचना के माध्यम से उच्च स्तरीय परिस्थितियों के वार्तालाप का ज्ञान:

वाद-विवाद, सामूहिक परिचर्चा, व्यक्तित्व अभिव्यक्ति एवं वार्तालाप अभ्यास

लेखन अभ्यास: आलेख, पत्र, समाचार, पुस्तकीय आलेख, प्रतिवेदन इत्यादि; उच्च स्तरीय लेखन कार्य में आलंकारिक / शब्दाडंबरपूर्ण भाषा का उपयोग

Module IV: Cultural and social influences on communication

Analytical understanding of Cultural and social aspects of communication in Hindi-speaking regions

Major communication styles: across generations, cultures and regions

Major Hindi Dialects of different regions of India

विभिन्न हिंदी भाषी क्षेत्र एवं वार्तालाप सम्बद्ध सामाजिक एवं सांस्कृतिक दृष्टिकोण एवं विवेचन

विभिन्न वार्तालाप पद्धतियाँ: सांस्कृतिक, क्षेत्रीय एवं पीढ़ी दर पीढ़ी परिवर्तन के सन्दर्भ में

विभिन्न भारतीय क्षेत्रों की प्रमुख हिंदी उपभाषाएँ एवं बोलियाँ

Module V: Professional communication and specialized communication

Communication in professional contexts: Vocabulary building for professional use, Writing emails, letters and memos in Hindi

Communication used in core business sectors for specific purposes: tourism, healthcare, education, etc.

Vocabulary building and sentence formation for specialized professional communication

Role-play exercises for specialized communication scenarios viz. institutional, administrative, professional, legal, corporate and business communications etc.

व्यावसायिक वार्तालाप सन्दर्भ: व्यावसायिक वार्तालाप हेतु शब्दकोश का ज्ञान, ई-मेल/पत्र, व्यावसायिक पत्र, ज्ञापन आदि

प्रमुख व्यावसायिक क्षेत्रों जैसे भ्रमण, स्वास्थ्य, शिक्षा इत्यादि क्षेत्रों में उपयोग में आने वाली शब्दावली का ज्ञान

व्यावसायिक वार्तालाप/सूचनाओं के आदान-प्रदान में उपयोगी शब्दावली, वाक्य संरचना एवं शब्दकोश का ज्ञान

अभिनय-नाटक/वार्तालाप गतिविधि/ नाटक रचना के माध्यम से विभिन्न/विशेषीकृत परिस्थितियों के वार्तालाप का ज्ञान — जैसे व्यावसायिक, प्रबंधकीय, संस्थागत, व्यावहारिक, संगठित/नियमित व्यापार सम्बन्धी एवं कानूनी वार्तालाप

Module VI: Use of Hindi in digital communication

Opportunities and Usage of Hindi language in social media and digital communication

Writing online content, public contents and professional contents in Hindi through in class activities.

सामाजिक संचार माध्यम/सोशल मीडिया, अंकीय माध्यम/डिजिटल मीडिया में हिंदी भाषा का प्रयोग एवं संभावनाएं

सीधा संचार संपर्क/ आन लाइन के सन्दर्भ में प्रारूप लेखन/कंटेंट राइटिंग, सार्वजनिक लेखन, व्यावसायिक लेखन इत्यादि का ज्ञान एवं अभ्यास

AECA101T/AECA201T: COMMUNICATIVE ASSAMESE II
(2 credits – 30 hours) (L-T-P: 2-0-0)

Course Objectives

The objective of this course is to provide Advance Writing Skill in Assamese Language, knowledge of Assamese grammar, Conversational practice, Cultural and Social Communication, Advance Grammar Concepts and finally to provide professional communication in Assamese.

Course Outcomes

CO 1: Understand the Advanced vocabulary buildings.

CO 2: Explain the Advance sentence formation in Assamese language.

CO 3: Evaluate the importance of Assamese culture professional communication.

Module I: Advanced vocabulary building (6 Hours)

- a. Review of basic Assamese pronunciation and sentence formation
- b. Review of intermediate level vocabulary and grammar
- c. Vocabulary building for advanced topics: politics, economics, technology. etc.
- d. Use of synonyms, antonyms, and homonyms

Module II: Advanced grammar concepts (8 hours)

- a. Advanced sentence formation: passive voice, direct and indirect speech, etc.
- b. Use of conjunctions, interjections, and transitional words

Module III: Conversational practice and Writing practice (8 Hours)

- a. Role-play exercises for advanced situations: negotiating, debating, expressing opinions, etc.
- b. Group discussion and conversation practice
- c. Writing practice for advanced topics: newspaper articles, reports, etc.
- d. Use of rhetorical devices in writing

Module IV: Cultural and social communication (8 hours)

- a. Cultural and social aspects of communication in Assam
- b. Differences in communication styles across generations and regions

- c. Professional communication and specialized communication
- d. Communication in professional contexts
- e. Vocabulary building for professional use
- f. Writing emails and memos in Assamese
- g. Communication for specific purposes: tourism, healthcare, education, etc.
- h. Vocabulary building and sentence formation for specialized communication Role-play exercises for specialized communication scenarios

AEFR101T: FRENCH BEGINNER LEVEL II

(2 credits – 30 hours) (L-T-P: 2-0-0)

Course objective

French Beginner level II is a course of 30 learning hours designed to help learners having completed French Beginner Level 1 to acquire more advanced language skills in French language. These skills prepare students to effectively communicate in French on topics related to various daily situations. Students enhance listening and speaking abilities in real-life situations, learn to read and write practical texts in French, and gain deeper understanding of francophone cultures. By the end of the session, learners are expected to be able to engage in a variety of simple daily conversations, read and write short paragraphs in French.

Course Outcomes

On completion of this course, students will be able to:

- CO1: Recall, name and identify the vocabulary and phrases related to who, when, where and other key question words, explain and interpret their meanings and select appropriate response. (Remembering, analyzing, evaluating)
- CO2: Use the vocabulary and sentence structures learned to converse and discuss on a range of topics related to everyday situations. (Understanding, applying)
- CO3: Demonstrate a deeper understanding of francophone countries' cultures, describe and summarize basic cultural values. (Applying, understanding, evaluating)
- CO4: Analyse cultural differences and choose appropriate ways to interact with speakers from Francophone countries. (Analysing, evaluating)
- CO5: Design and compose meaningful situational dialogues and perform them; invent skits by using the language skills learned. (Creating)

Module I: Pronunciation drills (8 hours)

Liaison and enchainment; Sound discrimination; Distinction of grammatical gender; Elision

Module II: Daily conversation and grammatical structures (16 hours)

a) Shopping

Expressing wishes and needs

Asking and giving direction

Telling time

Describing intention in near-future tense

Making an appointment

Module III: Introduction to Francophone cultures (6 hours)

Tourism, Arts and literature, Lifestyles

AEGR101T/AEGR201T: INTRODUCTION TO GERMAN LANGUAGE II**(2 credits – 30 hours) (L-T-P: 2-0-0)****Course Objectives**

The course aims at covering the basics of German language. It also covers a few basic grammar topics and an application of grammar in day-to-day life that is in reading, writing, listening, and speaking. On the completion of the first semester, one can understand and use familiar, everyday expressions and very simple sentences, can introduce him/her and others as well as ask others about themselves – e.g., where they live, who they know and what they own – and can respond to questions of this nature.

Course Outcomes

Students will be able to acquire a working knowledge in basic German

Course Contents

	Topic	Grammar
1	Daily schedule and arranging appointments	Dative sentences, verbs, prepositions
2	In the office, different jobs, and leisure activity	Sentence connectives: conjunctions (und, oder, aber)
3	On the computer and emails	The group of nouns
4	Living and the home furnishings	Pronouns
5	Clothes and the shopping	Adjectives
6	Health and body parts	Modal Verbs
7	Holiday, travel, and city tour	Past Tense

Suggested Reading

Netzwerk Deutsch als Fremdsprache A1, Textbook + Workbook by Stephanie Dengler

DEPARTMENT OF MANAGEMENT
PROGRAMME: FIVE-YEAR BBA-MBA INTEGRATED PROGRAMME
DEGREE: INTEGRATED MASTER OF BUSINESS ADMINISTRATION (iMBA)

Vision:

The five year BBA-MBA Integrated curriculum strives to grow into a significant position in Management education to create graduates in the field of business and management to become future business leaders, entrepreneurs who are socially responsible professionals capable of adapting into the dynamic corporate world having a globally acceptable vision.

Mission:

To focus on imparting the highest quality education at par with international standards with a strong foundation of management concepts and its applications, for students to excel and enhance their skills in order to make them accepted worldwide as managers.

To develop a strong industry-academia interface for project based learning, internships and placements. The pedagogy designed focus on practical learning through case studies, flipped classrooms, experiential projects, presentations, group discussions, etc enabling students to apply their knowledge in real world scenarios. This hands-on approach prepares the students to understand and interpret the challenges of the business world and enhances their critical thinking, analytical and communication skills.

Programme Outcomes (PO)

On successfully completing the program the student will be able to:

PO 1. Critical Thinking, Business Analysis and Problem Solving:

Take informed actions after identifying the assumptions that frame our thinking and actions, checking out the degree to which these assumptions are accurate and valid, and looking at our ideas and decisions (intellectual, organizational, and personal) from different perspectives.

PO 2. Effective Communication:

Speak, read, write and listen clearly in person and through electronic media in English and in one Indian language, and make meaning of the world by connecting people, ideas, books, media and technology.

PO 3. Social Responsiveness and Interaction:

Developing responsiveness to contextual social issues / problems and exploring solutions. Elicit views of others, mediate disagreements and help reach conclusions in group settings.

PO 4. Ethical and responsible citizen:

Recognize different value systems including your own, understand the moral dimensions of your decisions, and accept responsibility for them. : Demonstrate empathetic social concern and equity centred national development, and the ability to act with an informed awareness of issues and participate in civic life through volunteering.

PO 5. Environment and Sustainability:

Understand the issues of environmental contexts and sustainable development.

PO 6. Leadership and Team work,

Understanding leadership roles at various levels of the organization and leading teams. Self-directed and Life-long Learning: Acquire the ability to engage in independent and life-long learning in the broadest context socio-technological changes

Program Specific Outcomes (PSO)

On the successful completion of B.B.A., the students will be able to:

PSO 1: Acquisition of Knowledge, skills and experiential learning in functional areas of management:

Comprehend the various concepts, processes and significance; to develop an insight and analytical abilities and also to develop the ability to provide solutions for effective decision making in practical business problems

PSO 2: Development of managerial skills:

Ability to visualize managerial problems and identify various alternatives to solve them To provide an opportunity for gaining practical understanding of the workplace and develop various leadership and interpersonal skills through internship training and also to make the students industry ready and to enhance critical thinking skills in understanding business challenges related to global business.

PSO 3: Entrepreneurship development skills:

To promote entrepreneurial skills by understanding the fundamentals of new business ventures. Ability to apply contemporary tools and techniques

MTMP100T: MANAGEMENT PROCESS, PRINCIPLES AND PRACTICES

(4 credits-60 Hours) (L-T-P: 4-0-0)

Objective(s): The objective of this course is to develop an understanding of the Principles and processes of management covering the basic management functions and challenges in the emerging perspective.

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: define the meaning of MPP. (Remembering)

CO2: explain the theory of planning and control. (Understanding)

CO3: determine the organisational process. (Applying)

Module I: Introduction to MPP (15 Hours)

Introduction: Concept, Nature, Process and Significance of Management; Managerial Roles (Mintzberg); Development of Management Thought- Classical, Neo -classical, Behavioural and Management Science Approach, System and Contingency Approaches.

Module II: Planning & Control (15 Hours)

Planning and Control: Concept, Process and Types; Planning Tools- Forecasting and Scheduling; Decision -making concept and process; Bounded rationality; Management by objectives; Corporate Planning- Environment analysis and Diagnosis

Module III: Organising (15 Hours)

Organising: Concept, nature, process and significance; Authority and Responsibility relationships Delegation, Decentralisation; Departmentation basis and formats (Project and Matrix); Formal and Informal Organisation; Changing patterns in Organisation structures in the Knowledge economy. Directing- Motivating and Leading People at work.

Module IV: Communication and Decision Making (15 Hours)

Role of communication; Communication media and technology, communication networks - formal vs. informal; barriers to effective communication; communication skills; persuasion in communication; active listening; participative decision making techniques; group vs. the individual; the decision making process

MTMF107T: ACCOUNTING FOR MANAGERS AND FINANCIAL MANAGEMENT

(Credits: 4- 60 hours) (L-T-P: 4-0-0)

Objective(s): To equip students with a comprehensive understanding of accounting and financial management principles, enabling them to apply financial analysis and decision-making tools for effective managerial control and strategic planning.

Course/Learning Outcomes

After learning this course, the students will be able to:

CO1: define the Fundamental accounting principles and financial management concepts. (Understanding)

CO2: identify the financial statements and interpret financial information for decision-making (Applying)

CO3: analyse the budgeting and financial control systems for effective resource management. (Analyzing)

CO4: evaluate the financial performance of a business and recommend strategies for improvement (Evaluating)

Module I: Financial Accounting

Introduction to accounting: Basic concepts, accounting principles, and the accounting cycle. Financial statements: Balance sheet, income statement, cash flow statement, and their analysis. Ratio analysis: Liquidity, profitability, solvency, and activity ratios. Inventory valuation and management: Inventory systems, valuation methods, and inventory control.

Module II: Cost Accounting

Introduction to cost accounting: Cost concepts, classification, and behavior. Cost-volume-profit analysis: Break-even point, margin of safety, and contribution margin. Job order costing and process costing: Costing systems and procedures. Activitybased costing: Concept, benefits, and implementation.

Module III: Financial Management

Financial management concepts: Goals, scope, and functions. Time value of money: Concepts, calculations, and applications. Capital budgeting: Techniques for evaluating investment proposals. Working capital management: Cash, receivables, and inventory management.

Module IV: Financial Markets and Institutions

Financial markets: Types, functions, and participants. Financial institutions: Commercial banks, investment banks, and financial intermediaries. Risk management: Types of risk, risk assessment, and risk mitigation. Financial instruments: Shares, debentures, and derivatives.

Module V: Budgeting and Financial Control

Budgeting process: Types of budgets, budgeting techniques, and zero-based budgeting. Performance evaluation: Responsibility accounting, variance analysis, and performance measurement. Financial forecasting and planning: Techniques and tools. Cash flow management: Cash budgeting and cash forecasting.

MTMM200T: MARKETING MANAGEMENT

(Credits: 4 - 60 hours) (L-T-P: 4-0-0)

Objective(s): *The Objective of the course is to introduce the students to the domain of marketing and to its practical applications.*

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: enumerate the fundamentals of marketing management. (Understanding)

CO2: assess the marketing environment. (Analyse)

CO3: analysing market segmentation. (Analysis)

CO4: examine pricing strategy and distribution channels. (Analysis)

CO5: importance of communication in marketing (Creating)

Module I: Fundamentals of Marketing (8 Hours)

Conceptual Framework of Marketing, Core Concepts of Marketing, Marketing Philosophies, Marketing Myopia, Marketing Practices developed over 21st Century; Different Contexts of Marketing Applications.

Module II: Marketing Environment (10 Hours)

Analysis of marketing environment: Macro and Micro components and their impact on marketing decisions, Macro & Micro environment of Marketing – Industry & Competitor analysis, Developing strategies.

Module III: Market Segmentation and Product Overview (13 Hours)

Consumer buying Model, Market segmentation, Targeting and Positioning, Market and Marketing research and Marketing Information System, Marketing Mix, Product mix strategies, : Product and service concept, Product Lines- Length, Breadth & depth, Product life cycle, New product Development, Brand concept, Brand Equity.

Module IV: Pricing and Distribution Strategies (14 Hours)

Pricing strategies, Price setting, Price determination. Channels of distribution: Types, Designing Distribution Channels, Managing Conflicts and Controls in Channels, Retailing, and Wholesaling, E-Retailing.

Module V: Marketing Communication Mix (15 Hours)

Marketing Communication, Integrated Marketing Communication, Promotional Mix Components- Advertising Vs Promotion, Advertising Vs Publicity, Sales Promotion, Public Relations, Personal Selling and Direct Marketing, Digital Marketing. Emerging issues in marketing, Ethical issues, Green marketing, Consumerism, CSR in marketing, Payment related issues in the cashless era.

MTOV201T: ORGANISATIONAL BEHAVIOUR

(4 credits-60 Hours) (L-T-P: 4-0-0)

Objective(s): The Objective of the course is to equip students with a comprehensive understanding of individual, group, and organizational behavior, enabling them to analyze organizational dynamics, develop effective interpersonal and leadership skills, and contribute to organizational success.

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: demonstration of fundamental concepts and theories of organizational behavior. (Understanding)
 CO2: assessing the individual and group behavior within organizational contexts (Evaluating)
 CO3: assessing the organizational behavior concepts to address real-world organizational challenges (Evaluating)
 CO4: categorise the effective interpersonal and leadership skills. (Analysis)
 CO5: evaluating the impact of organizational behavior on organizational performance (Evaluating)

Module I: Introduction (10 Hours)

Airline Industry – Scope, Types. Scheduled and Non-Scheduled Flights; Air Cargo Transport – Economic and Social impact; Regulatory Bodies; Key Performance indicators.

Module II: Fundamentals of Aviation Industry (12 Hours)

Airline Profitability, Main Industry, Characteristics of Passenger airlines, Service Industry – Characteristics.

Module III: Organisational Structure (12 Hours)

Airline Alliances, Development of commercial airlines, Deregulation – Impact of Deregulated Airline industry, Organizational Structure, Types of Airline Personnel, Flight crew and Cabin Crew Training, Organizational Culture.

Module IV: Airport and services (12 Hours)

Airports – Personnel, Processing Passengers and Freight, Airport Security, Air Navigation Services, Air Traffic Control, Airplanes – Manufacturers – Types of Aircraft.

Module V: Safety and Security (14 Hours)

Air Safety and Security, Role of Regulatory Agencies, Airside Safety, Culture of Safety, Issues in Air safety, Accident and Incident Investigation, Future of Airline Industry

Suggested Readings

Major 5: HUMAN RESOURCES MANAGEMENT

(5 credits- 75 hours) (L-T-P: 5-0-0)

Objective(s): The objective of this paper is to provide the students with a comprehensive understanding of human resource management principles and practices, enabling them to effectively manage human capital, contribute to organizational success, and foster a positive work environment.

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: define the nature and strategic role of human resource management in organizations (Remembering)

CO2: describe the human resource issues and challenges faced by organizations (Understanding)

CO3: explain the human resource management concepts and practices to solve organizational problems (Applying)

CO4: analyse the effective human resource policies and strategies (Analyzing)

CO5: evaluate the impact of human resource management on organizational performance. (Evaluating)

Module I: Human Resource Management: An Overview

Evolution of human resource management. Strategic human resource management. Human resource planning and job analysis. Recruitment and selection processes. Legal framework of human resource management

Module II: Human Resource Development

Training and development needs assessment. Training methods and techniques. Performance management and appraisal.

Career planning and development. Employee compensation and benefits

Module III: Organizational Behavior

Individual behavior in organizations: Personality, perception, attitudes, and motivation. Group dynamics and team building.

Leadership and organizational culture. Organizational change and development. Conflict management and negotiation

Module IV: Employee Relations

Employee communication and engagement. Employee welfare and safety. Industrial relations and collective bargaining. Labor laws and regulations. Grievance handling and disciplinary actions

Module V: Contemporary Issues in HRM

Global human resource management. Diversity and inclusion. Work-life balance. Organizational ethics and social responsibility. Human resource information systems (HRIS).

MTCB203T: CONSUMER BEHAVIOUR

(5 credits- 75 hours) (L-T-P: 4-0-0)

Objective(s): The objective of the course is to make the *students understand the different concepts of consumer behavior, role of social and cultural settings on consumer behavior and consumer buying process.*

Course/ Learning Outcomes:

At the end of this course students will be able to:

CO1: define the consumer behaviour. (Remembering)

CO2: explain the models of consumer decision process. (Understanding)

CO3: apply the factors influencing consumer behavior in developing marketing strategies, identify purchase decision and post purchase behaviour in varied marketing situations (Applying)

CO4: analyse market segmentation and segmentation of consumer markets, (Analysing)

CO5: assess the positioning strategies on buying behaviour. (Evaluating)

Module I: Contemporary Dimensions of Consumer Behaviour (15 Hours)

Consumer Behaviour, Consumer Decision-Making, Models of Consumer Decision –Making, Types of Consumer Buying Behaviour, Factors influencing Consumer Behaviour, Market Segmentation, Segmentation

of Consumer markets, Positioning, Differentiation and Marketing Mix, Marketing Research; Consumer Research Process, Types of Research Methods.

Module II: Implications Social and Cultural Settings on Consumer Behaviour (15 Hours)

Influence of culture and Subculture on Consumer Behaviour, Influence of Social Class on Consumer Behaviour, Social

Stratification and Marketing Strategy, Group Influence on Consumer Behaviour, Household and Family Influence on Consumer Behaviour, Socialisation of family Members, Family Purchasing Decision-Making and Consumption Related Roles, family Life Cycle.

Module III: Consumer Buying Process (15 Hours)

Stages of Consumer Buying Process, Purchase Decision and Post Purchase Behaviour, Traditional and Contemporary Models of Consumer Behaviour; Case study

Module IV: Advertising as a communication process (20 Hours)

Advertising as a tool of communication; Meaning, nature and importance of advertising; Types of advertising; Advertising objectives. Audience analysis; Setting of advertising budget: Determinants and major methods.

Major media types-their characteristics, internet as an advertising media, merits and demerits; Factors influencing media choice; media selection, media scheduling, Advertising through the Internet-media devices

Module V: Evaluating communication and sales effects (10 Hours)

Evaluating communication and sales effects; Pre- and Post-testing techniques

Suggested Readings

MTMD204T: BUSINESS MATHEMATICS & STATISTICS FOR DECISION MAKING

(4 Credits – 60 Hours) (L-T-P: 3-0-0)

Objective(s): The objective of this course is to familiarize students with the applications of mathematics and statistical techniques in business decision-making

Course/Learning Outcomes

At the end of this course students will be able to:

CO1: apply matrices in business and economic models (Applying)

CO2: illustrate the use of differentiation in business and economic models. (Applying)

CO3: identify the methods of calculating interest rates (Applying)
CO4: summarize data sets using descriptive statistics (Understanding)
CO5: analyse the relationship between two variables (Analysing)
CO6: determine the trend and seasonality in time series data (Evaluating)

Part – A: Business Mathematics

Module I: Matrices (7 Hours)

Definition of a matrix. Types of matrices; Algebra of matrices. Calculation of values of determinants up to third order; Adjoint of a matrix; Finding inverse of a matrix through adjoint; Applications of matrices to solution of simple business and economic problems

Module II: Differential Calculus (13 Hours)

Mathematical functions and their types – linear, quadratic, polynomial; Concepts of limit and continuity of a function; Concept of differentiation; Rules of differentiation – simple standard forms. Applications of differentiation – elasticity of demand and supply; Maxima and Minima of functions (involving second or third order derivatives) relating to cost, revenue and profit.

Module III: Basic Mathematics of Finance (5 Hours)

Simple and compound interest Rates of interest – nominal, effective and continuous – their interrelationships; Compounding and discounting of a sum using different types of rates

Part – B: Business Statistics Module IV: Uni-variate Analysis (15 Hours)

Measures of Central Tendency including arithmetic mean, geometric mean and harmonic mean: properties and applications; mode and median. Partition values - quartiles, deciles, and percentiles. Measures of Variation: absolute and relative. Range, quartile deviation and mean deviation; Variance and Standard deviation: calculation and properties.

Module V: Bi-variate Analysis (10 Hours)

Simple Linear Correlation Analysis: Meaning, and measurement. Karl Pearson's co-efficient and Spearman's rank correlation
Simple Linear Regression Analysis: Regression equations and estimation. Relationship between correlation and regression coefficients

Module VI: Time-based Data: Index Numbers and Time-Series Analysis (10 Hours)

Meaning and uses of index numbers; Construction of index numbers: Aggregative and average of relatives – simple and weighted, Tests of adequacy of index numbers, Construction of consumer price indices. Components of time series; additive and multiplicative models; Trend analysis: Finding trend by moving average method and Fitting of linear trend line using principle of least squares.

Major 8: MANAGERIAL ECONOMICS : (5 credits-75 Hours) (L-T-P: 5-0-0)

Objective(s): *The purpose of this course is to apply micro economic concepts and techniques in evaluating business decisions taken by firms. The emphasis is on explaining how tools of standard price theory can be employed to formulate a decision problem, evaluate alternative courses of action and finally choose among alternatives. Simple geometry and basic concepts of mathematics will be used in the course of teaching.*

Course/Learning Outcome

At the end of this course students will be able to:

CO1: explain the mechanics of supply and demand in allocating goods and services and resources (Remembering)

CO2: illustrate how changes in demand and supply affect markets (Understanding)

CO3: apply the choices made by a rational consumer (Applying)

CO4: interpret the relationships between production and costs (Evaluating)

CO5: discuss key characteristics and consequences of different forms of markets (Creating)

Module I: (20 Hours)

Demand, Supply and Market equilibrium: individual demand, market demand, individual supply, market supply, market equilibrium; Elasticity of demand and supply : Price elasticity of demand, income elasticity of demand, cross price elasticity of demand, elasticity of supply;

Theory of consumer behavior : cardinal utility theory, ordinal utility theory(indifference curves, budget line, consumer choice, price effect, substitution effect, income effect for normal, inferior and giffen goods), revealed preference theory.

Module II: (15 Hours)

Producer and optimal production choice: optimizing behavior in short run(geometry of product curves, law of diminishing marginal productivity, three stages of production), optimizing behavior in long run (isoquants, iso-cost line, optimal combination of resources) Costs and scale : traditional theory of cost (short run and long run, geometry of cost curves, envelope curves), modern theory of cost (short run and long run), economies of scale, economies of scope.

Module III: (20 Hours)

Theory of firm and market organization : perfect competition (basic features, short run equilibrium of firm/industry, long run equilibrium of firm/industry, effect of changes in demand, cost and imposition of taxes) ; monopoly (basic features, short run equilibrium, long run equilibrium, effect of changes in demand, cost and imposition of taxes, comparison with perfect competition, welfare cost of monopoly), price discrimination; monopolistic competition (basic features, demand and cost, short run equilibrium,

long run equilibrium, excess capacity) ; oligopoly (Cournot's model, kinked demand curve model, dominant price leadership model, prisoner's dilemma

Module IV :(20 Hours)

Factor Market: demand for a factor by a firm under marginal productivity theory (perfect competition in the product market, monopoly in the product market), market demand for a factor, supply of labour, market supply of labour, factor market equilibrium.

MTPO302T: PRODUCTION AND OPERATIONS MANAGEMENT

(4 credits- 60 hours) (L-T-P: 4-0-0)

Objective(s): This course aims at acquainting the students with the functions of production and operations management and basic issues and tools of managing production and operation functions of an organization. The course also intends to provide the students a system theoretic view on project management and helps develop an understanding on why today's organizations are cultivating a formal project management process to gain competitive advantage.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO1: define a production system. (Remembering)

CO2: explain the tools and techniques to measure work study, motion study. (Understanding)

CO3: demonstrate the procedure for product development and design. (Applying)

CO4: compute project completion time and Analyse and evaluate project risk management techniques. (Evaluating)

Module I: Introduction and Work Study (15 Hours)

Introduction to Production and operations management- Meaning and scope, subdivisions of work study

Method/Motion study and Work Measurement

Module II: Plant Location and layout (15 Hours)

Objectives, Locational factors, Economics of plant location

Meaning, objectives and types of plant layout and their relevance to mass, batch and job- order production systems. Systematic Layout Planning (SLP) procedure

Module III: Product design and Development and PPC (15 Hours)

Meaning of product, Product life cycle (PLC) and Product mix

Decisions to be taken during product development and design

Procedure for product development and design

Value of a product – its meaning, Value Analysis (VA) – its objectives, procedure and example, Simplification and Standardization.

Meaning and Objectives of PPC, Effects of types of production

Module IV: Project Management (15 Hours)

Project management framework, Project management processes, Cost and Time management, Project integration management, Project risk management, Project Quality management, Project communication management.

Suggested Readings

Adam, Ebert, Production and Operations Management, PHI.

R. Panneerselvam, Production and Operations Management, PHI.

MTFI304T: FINANCIAL MARKETS AND INSTITUTIONS

(4 credits – 60 Hours) (L-T-P: 4-0-0)

Objective(s): The objective of this paper is to introduce students to the different aspects and components of financial Institutions and financial markets and also to introduce them with the emerging application of technologies in the system. The study of the course will enable them to take rational decisions in the growing financial environment.

Course/Learning Outcomes

At the end of this course students will be able to:

CO1: describe the Indian banking system (Understanding)

CO2: explain the role of regulatory bodies in regulating the system (Understanding)

CO3: analyze the operative system of financial markets in India (Analyzing)

CO4: evaluate the types of debt instruments and their characteristics. (Evaluating)

CO5: elaborate the links between the theories of financial markets (Creating)

Module I: Structure of Indian Financial System (12 Hours)

An overview of the Indian financial system, financial sector reforms: context, need and objectives; major reforms in the last decade; competition; deregulation; capital requirements; issues in financial reforms and restructuring; future agenda of reforms; Regulation of Banks, NBFCs & FIs, Salient provisions of banking regulation act and RBI Act; Role of RBI as a central banker; Products offered by Banks and FIs: Retail banking and corporate banking products. Universal Banking: need, importance, trends and RBI guidelines.

Module II: Emerging Technologies in Indian Financial System (12 Hours)

Core banking solution (CBS); RTGS, IMPS and internet banking, mobile banking, NBFCs and its types; comparison between Banks and NBFCs; payment bankers such as PayTM, Google Pay etc

Module III: Introduction to Financial Markets in India (12 Hours)

Role and Importance of Financial Markets, Financial Markets: Money Market; Capital Market; Factors affecting Financial Markets, Linkages Between Economy and Financial Markets, Debt Market- role and functions of these markets, Issue of Corporate Securities: Public Issue through Prospectus, Rights Issue, On-Line IPO, Book Building of Shares, Disinvestment of PSU, Employees Stock Options, Preferential Issue of Shares,

Module IV: Secondary Market in India (12 Hours)

Introduction to Stock Markets, Regional and Modern Stock Exchanges, International Stock Exchanges, Comparison between NSE and BSE, Raising of funds in International Markets; Indian Stock Indices and their construction, Factors influencing the movement of stock markets, indicators of maturity of stock markets, Major Instruments traded in stock markets, Myths attached to Investing in Stock Markets. Trading of securities on a stock exchange; Selection of broker, capital and margin requirements of a broker, DEMAT System

Module V: Money Markets & Debt Markets in India (12 Hours)

Money Market: Meaning, role and participants in money markets, Segments of money markets, money market instruments.

Role of STCI and DFHI in money market, Debt Market: Introduction and meaning, Market for Government/Debt Securities in

India, Secondary market for government/debt securities, over subscription and devolvement of Government Securities,

Government securities issued by State Governments, Municipal Bonds, Corporate Bonds vs. Government Bonds

MTCL305T: CORPORATE AND BUSINESS LAW

(4 credits-60 Hours) (L-T-P: 4-0-0)

Objective(s): *The objective of this paper is to introduce students to the different aspects of Corporate and Business Law. To introduce them with the relevance and applications of the different laws*

Course/Learning Outcomes

At the end of this course students will be able to:

CO 1: define what a company is and how it is formed. (Remembering)

CO 2: explain the concepts related to the essential documents of companies (Understanding)

CO 3: explain the knowledge regarding administration of a company (Applying)

CO 4: Identify the legal provisions in the partnership business and its Act. (Analysing)

Module I: Introduction (12 Hours)

Introduction of Companies Act, 2013, meaning and characteristics of a company; types of companies including one person company, small company, and dormant company; association not for profit; illegal association; lifting of corporate veil; Registration and Incorporation of company, on-line filing of documents, promoters, their legal position, pre-incorporation contract; on-line registration of a company, Tribunal courts like NCLT, NCLAT etc

Module II: Documents of Companies (12 Hours)

Memorandum of association, Doctrine of ultra vires, Articles of association, Doctrine of constructive notice and indoor management, prospectus-shelf and red herring prospectus, misstatement in prospectus, book-building; issue, allotment and forfeiture of share, transmission of shares, buyback and provisions regarding buyback; issue of bonus shares.

Module III: Administration and Management of Company (12 Hours)

Classification of directors, women directors, independent director, small shareholder's director; disqualifications, director identity number (DIN); appointment; Legal positions, powers and duties; removal of directors; Key managerial personnel, managing director, manager;

Meetings: Meetings of shareholders and board of directors; Types of meetings, Convening and conduct of meetings, Requisites of a valid meeting, postal ballot, meeting through video conferencing, e-voting.

Committees of Board of Directors- Audit Committee, Nomination and Remuneration Committee, Stakeholders Relationship Committee, Corporate Social Responsibility Committee

Module IV: The Indian Contract Act, 1872 (12 Hours)

Proposal- its communication, acceptance and revocation; Agreement vis-à-vis contract, void agreement & voidable contract

Consideration – essential elements, exception to rule- No consideration no contract; privity of contract and consideration

Capacity to contract; Free consent – coercion, undue influence, misrepresentation, fraud; Mistake – of fact and of law

Legality of object – agreements opposed to public policy and in restraint of marriage, trade & legal proceedings;

Contingent contracts

Performance of contract–liability of joint promisor; Consequences of breach of contract–liquidated damages and penalty, Quasi contract; Indemnity guarantee–surety's liability

Bailment–Duties and liabilities of bailor and bailee, bailment of pledges;

Agency–types of agency, agents duty to principal and vice-versa, ratification and revocation of agent's authority

Module V: The Partnership Act, 1932 (12 Hours)

- a) Nature of Partnership; Relation of partners-inter se; Relation of partners to third parties; Incoming and outgoing partners
- b) Dissolution of Firm; Registration of Firms-effect of non-registration

MTMP306P: FIELD BASED LEARNING/MINOR PROJECT**(4 credits-60 Hours) (L-T-P: 0-0-4)**

Objective(s): The objective of the minor project is to acquaint the students with the experiential learning through field work / survey on any related areas from the field of management.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

- CO1: define the different types of research project. (Remembering)
- CO2: explain the various steps of designing research project (Understanding)
- CO3: building questionnaire and schedules (Applying)
- CO4: assessing the data for analysis (Analyzing)
- CO5: appraising the findings in the report (Evaluating)
- CO6: designing a research project report (Creating)

GUIDELINES:**Module I: INTRODUCTION**

Broad introduction to thesis topic and method. Page or two.

Research problem. State broadly, in question form. Give sub-questions. Explain carefully. In one sense, usually the problem is to expand the body of knowledge examined in the literature review.

Need for the research. Who will benefit? Discuss applied and scientific contributions.

Nominal definitions. Define central terms.

Context. Add further info to clarify the research problem.

Module II: THEORY- Literature review

Overview. Theoretical foundations

Literature. Group articles by ideas. For a given idea, first discuss common strands in the literature, then departures

Scope of the study. Theoretical assumptions; discuss limitations they impose.

Module III: METHODS. Outline in a few pages.

Introduction. General description of method and design.

Design. Experiment, quasi-experiment, survey, and so forth. Detailed description

Sample. Universe, population, element, sample design, tolerance, probability.
Measurement. Operational definitions. Include, as applicable, detailed discussion of indexes/ scales.
Specify methods used to assess validity and reliability.
Analysis. Techniques to be used; justification. Nature of relationships expected
(e.g., asymmetrical, symmetrical, reciprocal; linear).
Methodological assumptions. Discuss limitations they impose.

APPENDICES

Schedule. In Gantt Chart form.
Facilities. Faculty and staff expertise, library and computer resources, other special facilities contributing to a successful study. C. Budget.
D. Bibliographic essay. Sources searched (indexes, abstracts, bibliographies, etc.).
Strengths and weaknesses of literature.

Module IV: FININGS

A. Brief overview.
Results of application of method; any unusual situations encountered. Nature of sample.
Descriptive analysis. One-way frequency distributions on central variables.
Validity/reliability analysis.
Tests of hypotheses.

Module V: DISCUSSION

When discussing implications, deal with both the theoretical and the practical. Present only interpretations of the findings, not opinion.
Brief overview.
Discussion of results of application of method. Implications.
Discussion of descriptive analysis. Implications.
Discussion of tests of hypothesis. Implications.
Post-hoc analysis. Implications.

Module VI: CONCLUSION May include writer's opinion. A. Summary of entire thesis in a few pages.

Conclusions. Refer to lit review.
Implications. Speculate about broadest possible consequences, both theoretical and practical.
Label speculation clearly.
Limitations. Theory, method.
Suggestions for future research.

APPENDICES; Bibliographic essay; Questionnaire;Raw data

MTCF400T: CORPORATE FINANCE

(5 Credits - 75 hours) (L-T-P: 5-0-0)

Objective(s): *To acquaint students with the techniques of financial management and their applications for business decision making.*

Course/Learning Outcomes

At the end of this course students will be able to:

- CO 1: define the strategic objectives of the organisation for finance function. (Remembering)
- CO 2: explain the different sources of corporate finance (Understanding)
- CO 3: interpret the impact of risk and cost of capital impact on investment appraisal. (Applying)
- CO 4: analyze the factors impacting the cost of capital (Analyzing)
- CO 5: evaluate a corporation's capital structure (Evaluating)

Module I: Nature of Financial Management (20 Hours)

Nature of Financial Management: Finance and related disciplines; Scope of Financial Management; Profit Maximization, Wealth

Maximization - Traditional and Modern Approach; Functions of finance – Finance Decision, Investment Decision, Dividend Decision; Objectives of Financial Management; Organisation of finance function; Concept of Time Value of Money, present value, future value, and annuity.

Module II: Long -term investment decisions (20 Hours)

Long -term investment decisions: Capital Budgeting - Principles and Techniques; Nature and meaning of capital budgeting; Estimation of relevant cash flows and terminal value; Evaluation techniques - Accounting Rate of Return, Net Present Value, Internal Rate of Return & MIRR.

Concept and Measurement of Cost of Capital: Explicit and Implicit costs; Measurement of cost of capital; Cost of debt; Cost of perpetual debt; Cost of Equity Share; Cost of Preference Share; Cost of Retained Earning; Computation of overall cost of capital based on Historical and Market weights

Module III: Capital Structures (20 Hours)

Capital Structures: Approaches to Capital Structure Theories - Net Income approach, Net Operating Income approach, Modigliani-Miller (MM) approach, Dividend Policy Decision - Dividend and Capital; The irrelevance of dividends: General, MM hypothesis; Relevance of dividends: Walter's model, Gordon's model; Leverage Analysis: Operating and Financial Leverage; EBIT-EPS analysis; Combined leverage.

Module IV: Working Capital Management (15 Hours)

Working Capital Management: Management of Cash - Preparation of Cash Budgets (Receipts and Payment Method only); Cash management technique (Lock box, concentration banking), Receivables Management – Objectives; Credit Policy, Cash Discount, Debtors Outstanding and Ageing Analysis; Costs - Collection Cost, Capital Cost, Default Cost, Delinquency Cost, Inventory Management (Very Briefly) - ABC Analysis; Minimum Level; Maximum Level; Reorder Level; Safety Stock; EOQ (Basic Model), Determination of Working Capital.

MTSC401T: SUPPLY CHAIN MANAGEMENT

(5 credits – 75 Hours) (L-T-P: 5-0-0)

Objective(s): The objective of this paper is to acquaint the students with the concepts and tools of supply chain management and logistics as relevant for an international firm.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO1: define the process of supply chain management. (Remembering)

CO2: demonstrate operational purchasing methods and techniques on supplier management (Understanding)

CO3: explain the strategic importance of logistics elements (Understanding)

CO4: apply sales and operations planning, MRP and lean manufacturing concepts. (Applying) CO5: analyse creation of new value in supply chain for customers & society. (Analysing)

Module I: Basic Framework (15 Hours)

Concept of supply chain management (SCM); SCM and trade Logistics; Business view of SCM; Push and pull of SCM; Decision phases; Impellers and drivers in SCM Process views of SCM, planning and operations; Supply chain modeling; Role of Relationship marketing in SCM; managing relationships with suppliers and customers; Designing strategic distribution network; Factors influencing distribution network.

Module II: Supply Chain and Information Management Systems (15 Hours)

Purchasing Process- Strategic role of purchasing in the supply chain and total customer satisfaction; Types of purchases; Purchasing cycle; Supplier selection and evaluation; Vendor development; Importance of information management; Distribution and sharing of information; Information Technology as a platform for effective and efficient supply chain management

Module III: Logistic System (10 Hours)

Concept, objectives and scope of logistics; System elements; Inbound and Outbound logistics. Reverse inventory, Value added role of logistics, Logistics interface with manufacturer and marketing, Packing, Marking, Just in time concept; Third party logistic outsourcing—challenges and future directions

Module IV: Transportation (20 Hours)

Importance of effective transportation system; Service choices and their characteristics; inter- modal services; Transport cost characteristics and rate fixation; Carrier selection determinants and decision; Structure of Shipping: World seaborne trade; international shipping - characteristics and structure ;Liner and tramp operations; Liner freighting; Chartering-Types, principles and practices; Charter, party agreement; Development in sea transportation-Unitization, containerization, inter and multimodal transport; CFC and ICD; Indian shipping – growth, policy and problems; Ports and port trust; International Air transport: International set up for air transport: Freight rates; India's exports and imports by air – Problems and prospects; Carriage of Goods by sea, sea and combined transport.

Module V: Warehousing and Inventory Management (15 Hours)

Warehousing And Marketing Strategy; Objectives and functions of warehousing; Warehouse Strategies; Material handling equipment and material mobility Warehousing evaluation and requirements Inventory management-inventory categories, EOQ, LT, ICC; Inventory levels; Material planning and sourcing of procurement; Methods of cost reduction.

MTSM402T: SERVICES MARKETING**(Credits: 5- 75 Hours) (L-T-P: 5-0-0)**

Objective(s): The objective of this course is to make the students know the service concept, its evolution and growth. To make the students understand Marketing Mix in service marketing and its effective management and to know the service marketing techniques applied in various sectors.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO1: relate the importance of service economy and Services characteristic.

(Remembering)

CO2: explain the concept of Service Marketing Mix (Understanding)

CO3: identify the various service deliver gap and developing appropriate solutions (Applying)

CO4: analyse the reasons for service failure (Analysing)

Module I: Introduction to Service Economy (15 Hours)

Emergence of the service economy, Concept and nature of Service, Difference between goods and services, Service marketing Mix, Service Management Trinity

Module II: Service Consumer Behaviour (20 Hours)

Understanding the Service Customer as a Decision Maker, service purchase and risk association, Service Evaluation process, The Service Consumer Decision Process, and The Decision-making Process in the Service Sector, Components of Customer Expectations, Service Satisfaction, Service Quality Dimensions

Module III: Service Delivery Process (20 Hours)

Managing Service Encounters, Common Encounter Situations, Managing Service Encounters for Satisfactory Outcomes, Service

Failure, Service Recovery, Process of Service Recovery, Customer Retention and Benefits

Module IV: Delivering Quality Service (20 Hours)

Causes of Service delivery failure – Quality Gaps. The Customer Expectations *versus* Perceived Service gap. Factors and Techniques to Resolve this Gap. Customer Relationship Management. Gaps in Services – quality standards, Factors and Solutions – The Service Performance Gap – Key Factors and Strategies for Closing the Gap. External Communication to the Customers – the Promise *versus* Delivery Gap – Developing Appropriate and Effective Communication about Service Quality

Objective(s): To familiarize the students with various concept and technique that can help in effective corporate structuring in business. Focus will be on the practical application of the concepts learnt.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO1: define the concept and function of joint venture (Remembering)

CO2: explain the theories of merger and acquisition (Understanding)

CO3: identify takeover and its types (Applying)

CO4: discover the various techniques of valuation of firms during merger (Analyzing)

CO5: assess the impact of merger on shareholders and different stakeholders (Evaluating)

Module I: Joint Ventures: (15 Hours)

Joint Ventures: Concept & Meaning of Joint Ventures, Need & Types of Joint Ventures, Structures & Problems faced in Joint Ventures, some relevant case study of successful and failed joined ventures.

Module II: Mergers and Acquisitions (20 Hours)

Mergers and Acquisitions: Introduction to mergers, types of mergers, theories of mergers & acquisitions, merger strategy - growth, synergy, operating synergy, financial synergy, diversification; Cross-border mergers and acquisitions, issues and challenges in cross border M&A. Handling cross-culture and taxations issues in cross-border M&A. Analysis of Post-Merger Performance. Demerger, types of demergers, reverse merger, buyback of shares, leverage buy-out strategy, Takeover and its types, takeover strategy, takeover bids, legal framework for mergers and acquisitions, leverages and buyouts; Hostile tender offers and various anti-takeover strategies.

Module III: Mergers and Acquisitions (20 Hours)

Deal Valuation and Evaluation: Factors affecting valuation basics, methods of valuation, cash flow approaches, economic value added (EVA), sensitivity analysis, and valuation under takeover regulation, valuation for slump sale, cost-benefit analysis, and swap ratio determination.

Module IV: Post-Merger Evaluation (20 Hours)

Post-Merger Evaluation: Financial Evaluation of Mergers & Acquisitions, Impact on shareholders' Wealth; Methods of payment and financing options in mergers & acquisitions, financing decision, Merger, Acquisition and Competition law 2002, SEBI (Securities & Exchange Board of India) Takeover Code 2011 and criteria for negotiating friendly takeover.

MMTMR309T: MARKETING RESEARCH

(Credits: 4- 60 Hours) (L-T-P: 4-0-0)

Objective(s): This course is designed to provide students with the necessary skills and knowledge to determine the information necessary to address an identified research problem (basic or applied) and, using this understanding, develop and use an actionable research proposal. In this process, the students will gain an understanding of relevant approaches and elements of undertaking a research enquiry specifically to provide insights to solving a relevant problem.

COURSE/LEARNING OUTCOMES

At the end of the course students will be able to:

CO1: define marketing research (Remembering)

CO2: explain sample and sampling design (Understanding)

CO3: identify various data collecting methods and tools (Applying)

CO4: analyse data hypothesis and testing procedures (Analyzing)

Module I: Introduction of Marketing Research: (15 Hours)

Define Marketing Research, Aims and Objectives of Marketing Research. Applications of Marketing Research, Marketing Information System, Evaluation and Control of Marketing Research, Value of Information in Decision Making, Steps in Marketing Research. Research Design: Formulating the Research Problem, Choice of Research Design, Types of Research Design, Sources of Experimental Errors.

Module II Sample and Sampling Design: (15 Hours)

Some basic terms, Advantages and Limitation of Sampling, Sampling process, Types of Sampling, Types of Sample Designs, Determining the Sample Size, Sampling Distribution of the Mean. Scaling Techniques: The concept of Attitude, Difficulty of Attitude Measurement, Types of Scales, Applications of Scaling in Marketing Research.

Module III: Data Collection: (15 Hours)

Secondary Data, Sources of Secondary Data, Primary Data, Collection of Primary Data, Methods of Data Collection- Observation, Questionnaire, Designing of Questionnaire. Data Processing and Tabulation: Editing, Coding and Tabulation.

Module IV: Data Analysis: (15 Hours)

Testing of Hypothesis, Measurement of Central Tendency, Dispersion, Univariate Analysis, Multiple Regression, Factor Analysis, Cluster Analysis, Multidimensional Scaling, Conjoint Analysis; Interpretation and Report Writing, Types of Research Reports

MMTIP312T: INVESTMENT ANALYSIS & PORTFOLIO MANAGEMENT

(4 Credits-60 Hours) (L-T-P: 4-0-0)

Objective(s): To learn the basics of investing and decide where to invest with less risk.

Course/Learning Outcomes

At the end of this course students will be able to:

CO1: define the investment environment, different types of investment vehicles (Remembering)

CO2: explain the logic of investment process (Understanding)

CO3: apply the quantitative methods for investment decision making (Applying)

CO4: analyse the portfolio theory and the process of investment portfolio formation (Analysing)

CO5: analyze relevance of stocks and bonds for the investments (Analysing)

Module I: Basics of risk and return (15 Hours)

Concept of returns, application of standard deviation, coefficient of variation, beta, alpha. Bonds: present value of a bond, yield to maturity, yield to call, yield to put, systematic risk, price risk, interest rate risk, default risk. Yield curve and theories regarding shape of yield curve. Unsystematic risk and non-risk factors that influence yields. Duration and modified duration, immunization of a bond portfolio. Fundamental analysis, Economic analysis, Expected direction of movement of stock prices with macroeconomic variables in the Indian context; Industry analysis: stages of life cycle, Porter's five forces model, SWOT analysis, financial analysis of an industry

Module II: Share valuation (15 Hours)

Dividend discount models- no growth, constant growth, two stage growth model, multiple stages; Relative valuation models using P/E ratio, book value to market value. Technical analysis: meaning, assumptions, difference between technical and fundamental analysis; Price indicators- Dow theory, advances and declines, new highs and lows. Volume indicators- Dow Theory, small investor volumes. Other indicators- futures, institutional activity, Trends analysis: line chart, bar chart, candle chart, point & figure chart. Patterns: head & shoulders, triangle, rectangle, flag, cup & saucer, double topped, double bottomed, Indicators: moving averages. Efficient market hypothesis; Concept of efficiency: Random walk.

Module III: Portfolio analysis (15 Hours)

Portfolio risk and return, Markowitz portfolio model: risk and return for 2 and 3 asset portfolios, concept of efficient frontier & optimum portfolio. Market Model: concept of beta systematic and unsystematic risk. Investor risk and return preferences: Indifference curves and the efficient frontier, Portfolio management services: Passive – Index funds, systematic investment plans. Active – market timing, style investing.

Module IV: Capital Asset Pricing Model (CAPM) (15 Hours)

Efficient frontier with a combination of risky and risk-free assets. Assumptions of single period classical CAPM model. Characteristic line, Capital Market Line, Security market Line. Expected return, required return, overvalued and undervalued assets. Mutual Funds: Introduction, calculation of Net Asset Value (NAV) of a Fund, classification of mutual fund schemes by structure and objective, advantages and disadvantages of investing through mutual funds. Performance Evaluation using Sharpe's Treynor's and Jensen's measures .

MTRM406T: RESEARCH METHODOLOGY

(Credits: 2- 30 Hours) (L-T-P: 2-0-0)

Objective(s): This course is designed to provide students with the necessary skills and knowledge to determine the information necessary to address an identified research problem (basic or applied) and, using this understanding, develop and use an actionable research proposal. In this process, the students will gain an understanding of relevant approaches and elements of undertaking a research enquiry specifically to provide insights to solving a relevant problem.

COURSE/LEARNING OUTCOMES:

At the end of this course students will be able to:

CO1: Understand the various kinds of research, objectives of doing research

(Understanding & remembering)

CO2: Applying basic knowledge on qualitative research techniques, and adequate knowledge on measurement & scaling techniques as well as the quantitative data analysis. (Generating inferences)

CO3: Analyzing of data analysis-and hypothesis testing procedures (Analysis)

Module I: Introduction: (6 Hours)

Meaning of Research, Objectives of Research, Types of Research, Research Process, Research Problem formulation; Research

Design: Features of a good research design; Different Research Designs; Measurement in Research; Data types; Sources of Error

Module II: Measurement and Scaling: (8 Hours)

Primary Level of Measurement- Nominal, Ordinal, Interval, Ratio, Comparative and Non-competitive Scaling Techniques, Questionnaire Design, Sampling Process, Sampling Techniques-Probability and Non-Probability Sampling, Sample Size Decision.

Module III: Data Collection: (10 Hours)

Primary & Secondary Data; Survey Method of Data Collection, Classification of Observation Method; Field-work and Data Preparation. Hypothesis: Null Hypothesis & Alternative Hypothesis; Type-I & Type-II Errors; Hypothesis Testing: Z-Test, T-Test, ANOVA, Concepts of Multivariate Techniques.

Module IV: Research Report: (6 Hours)

Meaning, Types and Layout of Research Report; Steps in Report Writing, Tabular & Graphical Presentation of Data, Citations, Bibliography and Annexure in Report, Avoid Plagiarism; Use of Statistical Software to Analysis the Data.

MTOM105L: OFFICE ORGANIZATION AND MANAGEMENT

(Credits: 3- 45 hours) (L-T-P: 3-0-0)

Objective(s): The course aims to establish the importance of office organisation and management and its role in the workplaces. It also prepares the students to acquire basic knowledge and skills necessary for different tasks and aspects in different industries

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: understand the basic knowledge of office organisation and management (Remembering)

CO2: demonstrate skills in effective office organisation (Understanding)

CO3: organise and to maintain the office records (Applying)

CO4: ability the different types of digital records. (Analysing)

CO5: appraise the different types of organisation structures (Evaluating)

Module I: Fundamentals Of Office Management (10 Hours)

Introduction: Meaning, importance and functions of modern office Modern Office Organisation: Meaning; Steps in office organisation; Principles of Office organisation, Organisation structure types, Nature of office services: Types of services in a modern office, decentralisation and centralisation of office services, Office management: Meaning, Elements and major processes of Office management Office Manager: Functions and qualifications of Office manager

Module II: Administrative Arrangement And Facilities (8 Hours)

Office Accommodation and its Importance: Location of Office, Choice of Location: Urban vs Suburban, Factors to be Considered in Selecting the Site, Securing Office Space, Office Lay-out: Objectives of Office Lay-out, Types of offices: Open Office and Private Office- advantages and disadvantages.

Module III: Office Environment (10 Hours)

Meaning and Components of Office Environment Interior Decoration: Colour Conditioning, Floor Coverings, Furnishings,

Furniture and Fixtures: Types of Furniture, Choice between Wooden and Steel Furniture, Principles Governing Selection of Furniture Lighting and Ventilation, Noise: Internal Noise, External Noise , Cleanliness, Sanitation and Health Safety and Security;

Module IV: Introduction to Records & Filing System (8 Hours)

Importance of Records, types of office records, Records Management: Meaning, Principles of Record Keeping, Functions of Records; Management Filing: Elements of Filing and Filing Functions, Objectives and Importance of Filing, Advantages of Filing, Essentials of a Good Filing System, Classification of Files. Filing Methods: Horizontal and vertical Filing. Office manual: contents, Importance, types of office manuals. Indexing: Meaning, importance, advantages and essentials of good indexing, Retention and disposal of files: Meaning and benefits of record retention, need for disposal of files, life-cycle stages of files.

Module V: Office Mechanisation and Data Processing (9 Hours)

Meaning, Importance and Objectives of Office Mechanisation, Advantages and disadvantages of Office Mechanisation, Factors Determining Office Mechanisation Kinds of Office Machines: Duplicating Machines and Photocopying Machines, Distinction between Data and Information, Importance of Data and Information, Classification of Data, Classification of Information, Data Collection Methods- Primary and secondary data collection methods Data processing using computers: Computer Applications in Office Management, Advantages and Limitations of Computerisation

MTRM210L: RETAIL MANAGEMENT**(Credits: 3- 45 hours) (L-T-P: 3-0-0)**

Objective(s): The course aims to establish the importance of retail management. It also prepares the students to acquire basic knowledge and skills necessary for different tasks and aspects of retail management.

Course/Learning Outcomes

At the end of the course students will be able to:

CO1: list the types and forms of Retail business. (Understanding)

CO3: examine Consumer Behavior in various environments. (Applying)

CO3: analyze various Retail operations and evaluate them. (Analysing)

CO4: determine the retail marketing mix. (Knowledge)

CO5: application of IT in retail sector (Applying)

Module I: Introduction to Retail Business (8 Hours)

Definition – functions of retailing - types of retailing – forms of retail business ownership. Retail theories – Wheel of Retailing – Retail life cycle. Retail business in India: Influencing factors – present Indian retail scenario.

Module II: Consumer Behaviour in Retail Business (10 Hours)

Buying decision process and its implication on retailing – Influence of group and individual factors, Customer shopping behaviour, Customer service and customer satisfaction.

Module III: Retail Operations (12 Hours)

Factors influencing location of Store - Market area analysis – Trade area analysis – Rating Plan method - Site evaluation. Retail Operations: Stores Layout and visual merchandising, Stores designing, Space planning, Inventory management, Merchandise Management, Category Management.

Module IV: Retail Marketing Mix (8 Hours)

Introduction -Product: Decisions related to selection of goods (Merchandise Management revisited) – Decisions related to delivery of service. Pricing: Influencing factors – approaches to pricing Place : Supply channel – SCM principles – Retail logistics – Promotion : Setting objectives – communication effects - promotional mix.

Module V: Information Technology in Retailing (7 Hours)

Non store retailing (e-retailing) - The impact of Information Technology in retailing - Integrated systems and networking – EDI – Bar coding – Electronic article surveillance – Electronic shelf labels – customer database management system.

ASE: VIRALITY IN DIGITAL MEDIA**(Credits-2 - 30 hours) (L-T-P: 2-0-0)**

Objective(s): To equip students with a comprehensive understanding of the principles and strategies behind viral content creation and distribution. The course will enable students to analyze digital platforms, identify viral trends, and develop effective strategies to create content that resonates with target audiences.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO 1: describe the concept of virality and its impact on digital marketing. (Remembering)

CO 2: describe digital platforms and audience behavior to identify viral potential. (Understanding)

CO 3: apply engaging and shareable content that aligns with viral trends. (Applying)

CO 4: evaluate the effectiveness of viral campaigns and optimize for future success. (Evaluating)

Module I: Understanding Virality

Definition and characteristics of viral content. The psychology of sharing: social proof, emotions, and triggers. Viral loops and feedback mechanisms. Case studies of successful viral campaigns.

Module II: Digital Platforms and Audience Analysis

Major social media platforms and their viral ecosystems. Understanding target audience demographics and psychographics.

Identifying viral trends and patterns. Influencer marketing and its role in virality

Module III: Content Creation and Curation

Content formats for virality: videos, images, text, and interactive content. Storytelling and narrative structure for maximum impact. Creating shareable content: hooks, headlines, and visual appeal. Content curation and repurposing for sustained engagement

Module IV: Viral Marketing Strategies

Developing a viral marketing plan. Leveraging user-generated content (UGC). Utilizing paid promotion for initial reach. Measuring and optimizing campaign performance. Crisis management for viral content.

Module V: Advanced Topics in Virality

Viral analytics and measurement tools. Ethical considerations in viral marketing. Global virality and cultural nuances. Future trends in viral marketing.

INTERNSHIPS

Semester	Category	Course Code	Course Name	Credits
2	Internship	MTIN106I	Internship	4
4	Internship	MTIN211I	Internship	4
5	Internship	MTIN315I	Internship	2

MTIN106I/MTIN211I: INTERNSHIP (Exit of 1st Year or 2nd Year)

(4 Credits- 120 Hours) (L-T-P: 0-0-4)

Objective(s)

The students are required to undergo an internship in work related to Commerce and Management during the semester break at the end of fourth Semester or fifth Semester. The purpose of this internship is to expose the students to real-life industry work situations. This is an opportunity for the students to learn the application of knowledge that they have acquired from the classes, in an on-the-job situation.

Course/Learning Outcomes

At the end of this course students will be able to:

CO 1: Identify career alternatives prior to graduation. (Understanding)

CO 2: Translate theory into practice. (Applying)

CO 3: Improve work habits and attitudes towards job success in workplace (Creating)

INTRODUCTION

The field of Management is very practical oriented and requires an in-depth knowledge about both the theoretical and practical aspect of business operations. In the BBA programme the students are made acquainted with the various facets of General Management, Marketing, HR and Finance functions. However, the lessons mostly remain with the limits of classroom discussion. The real practices of business are much more complex and subject to judgement of the manager. This internship is an attempt to enable the students to acquire some learning experiences in the practical field and equip themselves with necessary traits to succeed in the corporate environment.

INSTRUCTION AND GUIDELINES FOR STUDENTS

The students should follow the following instruction and guidelines during the course of internship:

The internship should be for a minimum duration of **three weeks for 120 hours** which can be extended up to any limit depending upon the convenience and requirement of the student and the organisation respectively.

The students have to undergo the internship at the end of 1st Year or 2nd Year if they choose to leave the programme . Any students willing to undergo internship during the semester classes will not be encouraged and would be completely on his/her own cost of attendance and classes. Further, in such a case, the Department holds full right to reject the internship of such student

The students can undergo internship at any organisation which is recognised or registered, as applicable, of their choice but the work must be related to commerce and management.

After the completion of the internship, the students must submit the Internship Report which should include the Internship Diary as an Annexure to the Report. The format of the Internship Report and Internship Diary should be in accordance with the one prescribed by the Department. e. There would be a Seminar Presentation (PPT) and Viva-Voce Examination towards the end of the 6th Semester based on which the students would be evaluated for the internship. The Internship report would also be a part of evaluation.

STRUCTURE OF INTERNSHIP

The Internship Report must comprise of the following:

- Recommendation Letter from the Department.
- Completion Certificate from the Organisation where the student has worked as intern.
- Internship Diary as per the prescribed format.

d. Organisation details (Address, E-mail, Contact Number) including name, contact number and e-mail of the supervisor is mandatory. This should be included as a part of the Internship Diary according to the prescribed format.

e. The Contents of the Report must include:

I. Introduction.

II. Objectives of the Internship.

III. About the Organisation (Sector, Activities, Operations).

IV. Description of the work.

The Assessment for the internship must have the following components:

a. Internship Report: 20 marks

b. Internship Diary: 20 marks

c. Seminar Presentation: 30 marks

d. Viva-Voce Examination: 30 marks

MTIN315I: INTERNSHIP (At the end of 4th Semester and evaluated in 5th Semester)

(2 Credits- 60 Hours) (L-T-P: 0-0-2)

Objective(s)

The students are required to undergo an internship in work related to Commerce and Management during the semester break at the end of fourth Semester or fifth Semester. The purpose of this internship is to expose the students to real-life industry work situations. This is an opportunity for the students to learn the application of knowledge that they have acquired from the classes, in an on-the-job situation.

Course/Learning Outcomes

At the end of this course students will be able to:

CO 1: Identify career alternatives prior to graduation. (Understanding)

CO 2: Translate theory into practice. (Applying)

CO 3: Improve work habits and attitudes towards job success in workplace (Creating)

8	Research Project/Dissertation	MTDI411P	Dissertation- II	20

MTDI408P: DISSERTATION - 1

(Credits: 5- 75 Hours) (L-T-P: 0-0-75)

Objective: The basic objective of the project work is to give students an idea of research. In which they need to undertake a field survey for collecting data. Further they need to analyse the data and present a report on the topic in which they have conducted research. The evaluation is done on the basis of the project report, presentation and viva-voce examination.

Guidelines Related To Project:

The entire project will be carried out in one phase. It includes Introduction and Review of Literature part, Research Methodology, Data Analysis and Interpretation and Findings, suggestions and conclusion part.

Course Outcome

- CO1: Define the different types of research project. (Remembering)
- CO2: Explain the various steps of designing research project (Understanding)
- CO3: Building questionnaire and schedules (Applying)
- CO4: Assessing the data for analysis (Analyzing)
- CO5: Appraising the findings in the report (Evaluating)
- CO6: Designing a research project report (Creating)

RESEARCH PROJECT / DISSERTATION-I

(CREDITS: 5- 75 HOURS) (L-T-P: 0-0-75)

Objective: The objective of the course would be to educate the students about the various dimensions of a research-based project work. The students will also be taught about the application of statistical tools through SPSS.

Course Outcomes

At the end of the course students will be able to:

- CO1: Define the different types of research project. (Remembering)
- CO2: Explain the various steps of designing research project (Understanding)
- CO3: Building questionnaire and schedules (Applying)
- CO4: Examining the data for analysis (Analyzing)
- CO5: Appraising the findings in the report (Evaluating)
- CO6: Designing a research project report (Creating)

The Dissertation will comprise of the following:

Synopsis: Submission of a write up on a specific area/topic of study

Review of Literature: Submission of a specified number of reviews to respective guide

Research Methodology: Lecture based on the topic of study

Referencing Style: Lecture on referencing style to be followed while submitting report

Training on application of Statistical software used in research

Submission of Progress Report

Report should comprise of Introduction, Review of Literature, Research Methodology and References.

EVALUATION:

A diary is to be maintained by every student to keep a record of meeting with his/her guide. A format of the diary will be circulated at the beginning with the semester.

Evaluation will be done by the respective guide based on timely submission of part-work and quality of work as follows:

Synopsis (30 marks)

Review of Literature (30 marks)

Research Methodology (30 marks)

Publication in Referred Journal: (10 marks)

REGULATIONS FOR PG PROGRAMMES SCIENCE AND TECHNOLOGY

ASSAM DON BOSCO UNIVERSITY REGULATIONS POST GRADUATE DEGREE PROGRAMMES

SCIENCE AND TECHNOLOGY

The following are the regulations of the Assam Don Bosco University concerning the Post- Graduate Programmes leading to the award of the Master's Degree in the disciplines of Science and Technology made subject to the provisions of its Statutes and Ordinances.

1.0 Academic Calendar

- 1.1 Each academic year is divided into two semesters of approximately 90 working days: an Autumn Semester (July – December) and a Spring Semester (January – June). The Autumn Semester shall ordinarily begin in July for students already on the rolls and the Spring Semester shall ordinarily begin in January. However, the first semester (Autumn, for newly admitted students) may begin later depending on the completion of admission formalities.
- 1.2 The schedule of academic activities approved by the Academic Council for each semester, inclusive of the schedule of continuing evaluation for the semester, dates for the conduct of end-semester examinations, the schedule of publication of results, etc., shall be laid down in the Academic Calendar for the semester.

2.0 Duration of the Programme

- 2.1 The normal duration of the Post Graduate Programme shall be as per the table given below:

Programme	Number of Semesters	Number of Years
Master of Technology (MTECH)	4	2
Master of Science (MSc)	4	2

- 2.2 However, students who do not fulfill some of the requirements in their first attempt and have to repeat them in subsequent semesters may be permitted up to 4 more semesters (2 years) to complete all the requirements of the degree.
- 2.3 Under exceptional circumstances and depending on the merit of each case, a period of 2 more semesters (1 year) may be allowed for the completion of the programme

3.0 Course Structure

- 3.1 The University follows Outcome Based Education with Choice Based Credit System (CBCS) for all the Post Graduate Degree Programmes. One credit is equivalent to 15 hours of lecture/tutorial or 30 hours of practical. The courses offered for the Post Graduate Degree Programmes are divided into two baskets – Core Courses and Elective Courses.

3.2 Core Courses: Core courses are those in the curriculum, the knowledge of which is deemed essential for students who are pursuing the said Post Graduate Degree Programme.

- 3.2.1 A student shall be required to take all the core courses offered for a particular programme.
- 3.2.2 The number of credits required from core courses shall be as prescribed by the competent academic authority.

3.3. Elective Courses: These are courses in the curriculum which give the student opportunities for specialization and which cater to his/her interests and career goals. These courses may be selected by the student and/or offered by the department conducting the programme, from those listed in the curriculum according to the norms laid down by the competent academic authority.

- 3.3.1 The number of credits which may be acquired through elective courses shall be prescribed by the competent academic authority.
- 3.3.2 It shall be the prerogative of the department not to offer an elective course which has less than 5 students opting for it.

The schema of categorisation of courses into baskets is as given below:

Core Courses	
Departmental Core (DC)	Core courses which are offered by the department conducting the programme
School Core (SC)	Core courses which are offered by a department other than the department conducting the programme, from within the same School
Institutional Core (IC)	Core courses which are offered by departments of the University from Schools other than the parent School
Elective Courses	
Departmental Elective (DE)	Elective courses which are offered by the department conducting the programme
School Elective (SE)	Elective courses which are offered by a department other than the department conducting the programme, from within the same School
Institutional Elective (IE)	Elective courses which are offered by departments of the University from Schools others than the parent School

***UGC Equivalent Courses-** Core Paper (DC), Ability Enhancement Compulsory Course (IC/SC), Skill Enhancement Course (IE), General Elective (IE/SE), Discipline Specific Elective (DE)

***AICTE Equivalent Courses** - Basic Science Course (IC), Engineering Science Course(IC), Open Elective Course (IC), Humanities and Social Science Courses (IC),Mandatory Course (IC), Professional Core Course (DC), Professional Elective Course (DE)

3.6 In order to qualify for a Post Graduate Degree, a student is required to complete the minimum credit requirements as prescribed by the competent academic authority.

3.7 In addition to the prescribed credit requirement, a student shall have to complete Institutional mandatory courses with Pass grade, as prescribed by the competent academic authority, from time to time, which shall be recorded in the Grade sheet but not taken into account for computing the SGPA and the CGPA.

3.8 **Audit Course:** Students who secure a CGPA of at least 8 at the end of the first may opt to take one audit course per semester from any Department from the second semester onwards, provided the course teacher permits the auditing of the course. This shall be done under the guidance of the Departmental Faculty Advisor/mentor. The student is free to participate in the evaluation process for such courses. However, an attendance of 75% is necessary for obtaining a P grade for such courses. When auditing courses offered by other departments, it shall be the responsibility of the student to attend such courses without missing courses of one's own department and semester.

3.9 In addition, students may also opt for additional elective courses in consultation with their mentors. Students are required to participate in the evaluation process of such courses. The grades obtained for such courses shall be recorded in the grade sheet, but not taken into account for computing SGPA and CGPA.

3.10 It shall be the prerogative of the department to not offer an elective course which has less than 5 students opting for it.

3.11 The medium of instruction shall be English and examinations and project reports shall be in English.

3.12 The course structure and syllabi of the Post Graduate Degree Programmes shall be approved by the Academic Council of the University. Departmental Boards of Studies (DBOS) shall discuss and recommend the syllabi of all the courses offered by the department from time to time before forwarding the same to the School Board of Studies (SBOS). The SBOS shall consider the proposals from the departments and make recommendations to the Academic Council for consideration and approval.

3.13 The curriculum may include industry training and /or fieldwork for a specified time. This is to be satisfactorily completed before a student is declared eligible for the degree. There shall be credit allocation

for such industrial training or fieldwork. Normally these activities shall be arranged during convenient semester breaks as shall be determined by the School Board of Studies.

- 3.14 **Faculty Advisor/Mentor:** A faculty advisor/mentor (and a co-mentor to perform the duties of a mentor during the absence of the mentor) to shall be assigned for groups of students. Faculty advisors/mentors shall help their mentees to plan their courses of study, advise them on matters relating to academic performance and personality development, and help them to overcome various problems and difficulties faced by them.

4.0 Admission

- 4.1 All admissions to the Post Graduate Degree Programmes of the University shall be on the basis of merit. There may, however, be provision for direct admission for a limited number of NRI/FN students.

4.2 Eligibility Criteria

4.2.1 To be considered for admission to a Post Graduate Degree Programme a candidate should have passed a Bachelor's Degree (or equivalent) programme of a recognised university securing grades/marks as specified in the table below.

4.2.2 Admission will be on the basis of the performance of the candidate at the graduate level, the Post Graduate Entrance Test conducted by the university and/or a personal interview. Candidates for MTECH who have a valid GATE score may be exempted from the entrance test.

Programme	Grade /Marks requirement from qualifying examinations	Entrance Examinations / Personal Interview
MTECH	Completed a Bachelor's Degree programme in the appropriate stream of technology from a recognised university successfully with a minimum CGPA of 6.5 (or equivalent). The Academic Council may establish other eligibility criteria for M Tech in a particular discipline.	Post Graduate Entrance Test of Assam Don Bosco University
MCA	Completed a Bachelor's Degree programme in any stream of a recognised university successfully with a minimum of 50 % marks in the aggregate. In addition, the candidate must have passed Mathematics or equivalent at the higher secondary level or above.	Post Graduate Entrance Test of Assam Don Bosco University
MSc	Completed a Bachelor's Degree programme in Science of a recognised university successfully with a minimum aggregate, specified by the competent academic body.	Satisfactory performance in the Personal Interview

4.3 Reservation of seats for the programme shall be as per the guidelines laid out in the Statutes of the University.

4.4 Admissions shall ordinarily close after a specified period from the date of commencement of the first semester, through a notification. However, in exceptional cases, admission of a candidate after the last date may be recommended to the University with justification, by the School / Departments concerned. Under such an event, this period shall not exceed four weeks from the date of commencement of the first semester.

4.4.1 The attendance of such students shall be computed from the date of admission.

4.4.2 Such students may be offered the opportunity of taking part in in-semester assessment modules which may have already been completed.

4.5 All candidates shall be required to satisfy the norms prescribed by the University for medical fitness prior to admission.

4.6 Candidates may be required to furnish a certificate of good conduct from the institution last attended.

4.7 Bridge Courses: The Departments shall make provision for Bridge Courses to facilitate admission of students from varied backgrounds to a programme of their choice.

4.8 Value-added Courses: Each department shall offer value-added courses, which are optional. Certificates will be awarded to those who successfully complete the course.

4.9 Anti-Ragging Affidavit: Students and Parents Undertaking Affidavit In compliance of the UGC Regulations, it is compulsory for each student and every parent to submit an online Anti-Ragging undertaking affidavit every academic year. The Link to fill out the online undertaking affidavit by students and parents is:

www.antiragging.in/affidavit_registration_disclaimer.html

www.c4yindia.org/Home/Undertaking

5.0 University Registration

5.1 Candidates shall have to register as bona-fide students with the University as per the University regulations within a period specified by the University, by a formal application routed through the Director of the School concerned.

6.0 Attendance

6.1 To be permitted to appear for the end-semester examination of a particular course, a student is required to have a minimum attendance of 75% for that course.

6.2 Deficiency in attendance up to 10% may be condoned by the Director of the School in the case of leave taken for medical and other grievous reasons, which are supported by valid medical certificates and other requisite documents.

6.3 Some students, due to exceptional situations like their own serious sickness and hospitalization or death of members of inner family circle (restricted to only father, mother, siblings), may have attendance below 65%. Such students may be given bonus attendance percentage for a particular course based on his/her attendance for that course during the remaining days of the current semester, as given in the following table:

Attendance during the remaining days of the current semester	Bonus percentage available in the current semester
95% or more	5
90% or more but less than 95%	4
85% or more but less than 90%	3
80% or more but less than 85%	2
75% or more but less than 80%	1

They shall be permitted to appear for the end-semester examination of the course if, on the strength of this bonus attendance percentage, they obtain 65% attendance for that course.

6.4 If the sum of the credits of the courses for which a student is unable to appear at the end- semester examinations exceeds 50% of the total credits allotted for the semester, he/she shall not be permitted to appear for the entire end-semester examinations in view of clause 9.5 of these Regulations.

6.5 The School may propose to set aside a certain portion of the in-semester assessment marks for attendance. The number of marks and modalities of their allotment shall be made known to the students at the beginning of each semester.

6.6 Leave

6.6.1 Any absence from classes should be with prior sanctioned leave. The application for leave shall be submitted to the office of the Director of the concerned School on prescribed forms, through proper channels, stating fully the reasons for the leave requested along with supporting documents.

6.6.2 In case of emergency such as sickness, bereavement or any other unavoidable reason for which prior application could not be made, the parent or guardian must promptly inform the office of the Director of the concerned School.

6.6.3 If the period of absence is likely to exceed 10 days, a prior application for grant of leave shall have to be submitted through the Director of the concerned School to the Registrar of the University with supporting documents in each case; the decision to grant leave shall be taken by the Registrar on the recommendation of the Director of the concerned School.

6.6.4 The Registrar may, on receipt of an application, also decide whether the student be asked to withdraw from the programme for that particular semester because of long absence.

6.7 It shall be the responsibility of the student to intimate the concerned teachers regarding his/her absence before availing the leave.

7.0 Grading System

7.1 Three types of courses are offered in the Post Graduate programmes:

Graded courses: For the majority of the courses, students shall be assessed and given grades.

Pass/No-Pass courses: There are some courses for which the students are expected to obtain a P grade to be eligible for the degree.

Audit Courses: A third category of courses are audit courses. These are optional.

However, students who opt for these courses must have the required attendance to obtain a P grade in the course.

7.2 Based on the performance of a student, each student is awarded a final letter grade in each graded course at the end of the semester and the letter grade is converted into a grade point. The correspondence between percentage marks, letter grades and grade points is given in the table below:

Marks obtained (x) or (%)	Grade	Description	Grade Points
$90 \geq x \leq 100$	O	Outstanding	10
$80 \geq x < 90$	A+	Excellent	9
$70 \geq x < 80$	A	Very Good	8
$60 \geq x < 70$	B+	Good	7
$50 \geq x < 60$	B	Above Average	6
$41 \geq x < 50$	C	Average	5
$x = 40$	P	Pass	4
$x < 40$ F		Fail	0
	AB	Absent	0
	PS	Pass	0
	NP	Not Passed	0
	X	Not Permitted	0

In addition, a student may be assigned the grades 'PS' and 'NP' for pass marks and non-passing marks respectively, for Pass/Nopass courses, or the grade 'X' (not permitted).

A student shall be assigned the letter grade 'X' for a course if he/she is not permitted to appear for the end semester examination of that course due to lack of requisite attendance.

A letter grade 'F' or 'X' in any course implies failure in that course.

A student is considered to have completed a course successfully and earned the credits if she/he secures a letter grade other than 'F' or 'X'.

7.3 At the end of each semester, the following measures of the performance of a student in the semester and in the programme up to that semester shall be computed and made known to the student together with the grades obtained by the student in each course:

7.3.1 The Semester Grade Point Average (SGPA): From the grades obtained by a student in the courses of a semester, the SGPA shall be calculated using the following formula:

$$SGPA = \frac{\sum_{i=1}^n GP_i \times NC_i}{\sum_{i=1}^n NC_i}$$

Where GP_i = Grade points earned in the i^{th} course

NC_i = Number of credits for the i^{th} course

n = the number of courses in the semester

The Cumulative Grade Point Average (CGPA): From the SGPA's obtained by a student in the completed semesters, the CGPA shall be calculated using the following formula:

$$CGPA = \frac{\sum_{i=1}^n SGPA_i \times NSC_i}{\sum_{i=1}^n NSC_i}$$

Where $SGPA_i$ = Semester Grade point of the i^{th} semester

NSC_i = Number of credits for the i^{th} semester

n = the number of semesters completed

The CGPA may be converted into a percentage by multiplying CGPA by 10.

Both the SGPA and CGPA shall be rounded off to the second place of decimal and recorded as such. Whenever these CGPA are to be used for official purposes, only the rounded off values shall be used.

There are academic and non-academic requirements for the Graduate programmes where a student shall be awarded the 'P' and 'NP' grades. Non-credit courses such as Extra Academic Programmes belong to this category. No grade points are associated with these grades and these courses are not taken into account in the calculation of the SGPA or CGPA. However, the award of the degree is subject to obtaining a 'P' grade in all such courses.

In the case of an audit course, the letters "AU" shall be written alongside the course name in the Grade Sheet. A student is not required to register again for passing failed audit courses.

8.0 Assessment of Performance

8.1 A student's performance is evaluated through a continuous system of evaluation comprising tests, quizzes, assignments, seminars, minor projects, major projects and end-semester examinations.

8.2 Theory Courses: Theory courses shall have two components of evaluation – in- semester assessment of 40% weightage and an end-semester examination having 60% weightage.

8.2.1 The modalities of the conduct of in-semester assessment and weightages attached to its various components shall be as published by the School/Department at the beginning of each semester.

8.3 Lab Courses: Lab courses (Laboratory, Drawing, Workshop, etc.) shall be evaluated on the basis of assessment of tasks assigned and end semester test/viva voce. The weightage assigned for these components of the evaluation is given in the following table:

Component	Weightage
Assessment of Tasks Assigned	40
End-semester test / Viva voce	60

8.3.1 The modalities of the conduct of evaluation under the heading "Assessment of tasks assigned", its components and the weightages attached to its various components shall be published by the department concerned at the beginning of each semester.

8.3.2 The evaluation of the end-semester test for a lab course may be done on the basis of criteria and weightage to be specified in the question paper, among which are included Organisation of the program/experiment Coding, freedom from logical and syntactical errors, and accuracy of the result obtained / conduct of the experiment assigned and accuracy of the result, Extent of completion

A comprehensive viva-voce which examines the overall grasp of the subject

8.4 End-Semester examinations

End-semester examinations for the theory courses, generally of three hours' duration, shall be conducted by the University. The Director of the concerned school shall make the arrangements necessary for holding the examinations.

In the end-semester examinations, a student shall be examined on the entire syllabus of the courses. A student shall not obtain a pass grade for a course without appearing for the end- semester examination in that course.

8.5 Research Seminar

During the course of the Post Graduate programme students may be required to conduct research seminars on a regular basis. The purpose of these research seminars is to encourage the students to conduct literature survey on the recent trends and developments in a chosen area of the discipline.

The literature survey conducted in preparation for these seminars may lead the students to the development of a project model to be executed during the final semesters of the programme. The Research Seminars shall be evaluated on the basis of a presentation, a report and a viva voce examination.

8.6 The Major Project / Research Project / Dissertation

Students of the Post Graduate Programme shall undertake a Major Project / Research Project / Dissertation during the course of their Post Graduate studies. The Major Project / Research Project / Dissertation (to be referred to as Major Project henceforth) is normally conducted in two phases during the last two semesters of the programme.

The Major Project may be a software project, a research oriented project or research work which leads to a dissertation, as may be relevant to the discipline in which the work is undertaken. If it is a research oriented work, it should expose the students to the current state of research in a chosen area of the discipline and lead to new developments in the area.

The Major Project is to be undertaken individually in the campus or outside as may be specified by the department.

Each department shall constitute a Departmental Project Evaluation Committee (DPEC) consisting of the Director of the School (Chairperson), Head of the Department (Vice Chairperson), Project Co-ordinator and two senior teachers from the department, with the Project Co-ordinator as the convenor. The DPEC shall co-ordinate the conduct and assessment of the project.

8.6.4.1 The DPEC will notify the schedule and modalities for the following stages in the implementation of the project.

Submission of the topic of the project.

Notification for assignment of project supervisors.

Submission of the synopsis

Schedule for the seminar presentation of synopsis.

Schedule for Progress Seminars, submission of progress reports and viva voce examination.

Date for the submission of the project report and a brief summary.

Dates for the end semester evaluation of the project.

The DPEC may ask a student to resubmit a synopsis if the same does not get its approval.

The project supervisor may be from outside the department or university. Such a supervisor should be approved by the DPEC and jointly supervise a project with a faculty member of the department.

The minimum qualification of a project supervisor shall be laid down by the DPEC in consultation with the Director of the School and authorities of the University.

The Chairperson of the DPEC will submit to the Controller of Examinations a panel of at least three names of external examiners at least three weeks before the end semester examination. The Controller of Examinations will appoint the external examiner(s) from this panel.

Each student shall submit to the DPEC four bound, printed copies of the project report, prepared according to the prescribed format made available, by the due date. The student will submit also three copies of a brief summary of the project that will be forwarded to the concerned examiners.

The DPEC will make the arrangements necessary to conduct the end semester evaluation in consultation with the examiners appointed by the University, during the dates notified.

The project will be evaluated through in-semester and end-semester assessments of equal weightage. The insemester assessment will be done by the DPEC and the project supervisor. The end-semester assessment will be done by the external examiner(s), the project supervisor and a member of the DPEC appointed by it for the purpose. The weightages attached to their respective evaluations shall be 60:20:20.

The DPEC will forward the in-semester assessment marks to the Controller of Examinations by the date specified by the Examination Department.

Given below are the suggested components of Internal assessment and respective marks assigned:

Synopsis: 15 marks

Seminar presentation of the synopsis: 15 marks

Project implementation: 40 marks

Pre-submission presentation: 15 marks

Pre-submission viva voce: 15 marks

8.6.14 Given below are the suggested components of External assessment and respective marks assigned:

Project implementation: 40 marks

Seminar presentation: 25 marks

Viva voce examination: 20 marks

Project documentation: 15 marks

Publication of papers and registering of patents are encouraged during the Post Graduate programme. Papers published or patents obtained may be awarded extra weightage during the evaluation of the project.

Those who obtain an 'F' grade for the major project will be required to re-enrol for it in the subsequent semester and pay the prescribed fees.

The Director will forward the marks obtained in the in-semester evaluation to the Controller of Examinations within the prescribed time as may be notified.

All evaluated work in a subject except the end semester answer scripts will be returned to the students promptly.

Eligibility for appearing in the end-semester examinations: A student shall be permitted to appear for the end-semester examinations, provided that

A student has not been debarred from appearing in the end semester examinations as disciplinary action for serious breach of conduct.

He/she has satisfactory attendance during the semester according to the norms laid out in section 6 of these regulations.

He/she has paid the prescribed fees or any other dues of the university within the date specified.

8.10 Registration for end-semester Examinations

The University shall, through a notification, invite applications from students to register for the end-semester examinations.

Students who have registered with the University (vide clause 5) and those who have applied for such registration may apply to appear for the end- semester examinations of the university, in response to the notification issued by the University, provided that they fulfil the eligibility norms as laid down in clause 8.9.

All eligible candidates shall be issued an admit card for the relevant examination and for specified courses. A student who does not have a valid admit card may not be permitted to write the end-semester examinations.

A student who secures an 'F' or 'X' grade in any course in a semester may register for the end- semester examination for that course in a subsequent semester when that course is offered again, within the maximum period of time allotted for the completion of the programme. The in-semester assessment marks obtained by him/ her in the last semester in which the said course was attended by him/her shall be retained.

Similarly, in case of an 'NP' grade in Extra Academic Programmes the student shall have to re-register for it in the appropriate semester of the next academic session.

When a student re-registers for the end semester examination of a course, in accordance with clause 8.10.4 above, the better of the two grades obtained (the old and the new) shall be considered for the calculation of SGPA and CGPA.

Conduct of Examinations: The University shall conduct the end-semester examinations in accordance with the applicable regulations on such dates as are set down in the Academic Calendar or as notified.

Declaration of Results: The University shall declare the results of a semester and make available to students their grade sheets within the time-frame prescribed by the relevant regulations of the university and specified in the academic calendar.

The University may withhold the results of a student for any or all of the following reasons

he/she has not paid his/her dues

there is a disciplinary action pending against him/her

he/she has not completed the formalities for University Registration according to the requirement of section 5 of these Regulations.

8.14 Re-examining of answer scripts

If a student feels that the grade awarded to him/her in a course is not correct, he/she may apply to the University for the re-examining of his/her answer script.

Re-examining of scripts may be of two different categories – scrutiny and re-evaluation.

Scrutiny: The activities under this category shall ordinarily be confined to checking correctness of the total marks awarded and its conversion into appropriate letter grades whether any part/whole of a question has been left unevaluated inadvertently correctness of transcription of marks on the tabulation sheet and the gradesheet issued in respect of the course under scrutiny.

Re-evaluation: Re-evaluation of the answer script by independent experts in the concerned subject(s).

Application for re-examining of answer scripts

A student may apply for scrutiny or re-evaluation for one or more courses of the just-concluded end-semester examinations within seven calendar days from the date of publication of its results in the application form prescribed for this purpose.

He/she shall pay the prescribed fee to the University as notified.

A student applying for scrutiny/re-evaluation shall expressly state on the application form whether the application made is for Scrutiny or for Re-evaluation. In each case, the student may also request to see his/her answer script.

All applications for scrutiny/re-evaluation must be routed through the Director of the concerned School.

If in the process of re-examining, the grade obtained in a course changes, the better of the two grades shall be assigned to the course. If there is a change, the new grade shall be recorded and a new grade sheet shall be issued to the student.

Without prejudice to any of the clauses of section 8.14, a student who has been found to have used unfair means during an examination shall not be eligible to apply for scrutiny or re-evaluation of answer scripts.

Repeat Examination: The University shall conduct repeat examination for those with F grade at a different time slot, as set down in the Academic Calendar or as notified. Such students should register for these examinations.

Improvement Examination

After the completion of the entire programme of study, a student may be allowed the provision of improvement examinations. These are to be availed of only once each in the Autumn and Spring semesters that immediately follow the completion of the programme, and within the maximum number of years permissible for a programme.

A student who has taken migration from the University shall not be eligible to appear for Improvement Examination.

A student may not choose more than the number of courses specified in the table below for improvement examinations.

Programme	Number of Courses for Improvement Examinations

	Autumn Semester	Spring Semester	Total
MCA	3	3	6
MSc	3	3	6
MTECH	2	2	4

After the improvement examination, the better of the two grades obtained (the old and the new) shall be considered for the calculation of SGPA and CGPA.

If the student improves his/her grades through the improvement examination, new grade sheets and comprehensive transcripts shall be issued to the student.

8.17 Special Examination

8.17.1 The University shall conduct Special Examinations to benefit the following categories of students: Students who, on the completion of the final semester, have some 'F' graded courses in the two final semesters, but no 'F' or 'X' graded courses in any of the previous semesters

Students who have only one 'F' graded course in a semester other than the two final semesters and do not have 'F' or 'X' graded courses in the two final semesters.

The Special Examinations shall ordinarily be conducted each year within a month of the declaration of the results of the Spring Semester.

Students who fail to secure 50% of the credits offered in the final semester shall not be eligible to appear for the special examinations. Such students will be governed by the provisions of clause 9.5 of these regulations. However, this restriction shall not apply in the case of students who are unable to appear in the end semester examinations due to exceptional situations like their own serious illness and hospitalisation or death of members of inner family circle (restricted to only father, mother, siblings).

Students who have 'X' graded courses only in the last two semesters may be offered the opportunity for participating in a Tutorial Programme which may be conducted during the semester break immediately following the end- semester examinations of the final semester and students who earn 85% attendance for the programme shall be permitted to appear for the Special Examinations. Separate fees shall be charged for the Tutorial Programme.

Students who do not obtain pass grades in any course at the special examinations shall have to apply in the prescribed format and appear for the end-semester examination of these courses when they are scheduled by the University during subsequent relevant end-semester examinations.

9.0 Enrolment (for semesters other than the first)

9.1 Every student is required to enrol for the relevant courses before the commencement of each semester within the dates fixed for such enrolment and notified by the Registrar.

9.2 Students who do not enrol within the dates announced for the purpose may be permitted late enrolment up to the notified date on payment of a late fee.

9.3 Only those students shall be permitted to enrol who have

- cleared all University, Departmental, Hostel and Library dues and fines (if any) of the previous semester,
- paid all required University, Departmental and Hostel fees for the current semester, and
- not been debarred from enrolling on any specific ground.

9.4 No student may enrol for a semester if he/she has not appeared, for whatever reason, in the end semester examinations of the previous semester.

9.5 A student who fails to obtain 50% of the credits offered in the third and subsequent semesters shall not be permitted to enrol for the next semester and shall have to re-enrol for and attend all the courses of the said semester in the following academic year. Students who due to X grade (lack of due attendance) have been debarred from exams in any semester (including first and second) will have to re-enrol for the same.

10.0 Eligibility for the Award of the Post Graduate Degree

10.1 A student shall be declared to be eligible for the award of the Post Graduate Degree for which he/she has enrolled if he/she has

- 10.1.1 completed all the credit requirements for the degree with grade 'C' or higher grade in each of the mandatory graded courses and grade 'PS' in all mandatory non-graded courses.
- 10.1.2 satisfactorily completed all the non-credit requirements for the degree viz., Extra Academic Activities, Industry Training, field work, internship programme, etc. (if any);
- 10.1.3 obtained a CGPA of 5.00 or more at the end of the semester in which he/she completes all the requirements for the degree;
- 10.1.4 owes no dues to the University, School, Department, Hostels; and
- 10.1.5 has no disciplinary action pending against him/her.
- 10.2 The award of the Post Graduate Degree must be recommended by the Academic Council and approved by the Board of Management of the University.

11.0 Termination from the Programme

- 11.1 If more than the number of years permitted for the completion of a programme have elapsed since the student was admitted, and the student has not become eligible for the award of Degree, the student shall be removed from the programme.
- 11.2 A student may also be required to leave the Programme on disciplinary grounds on the recommendations of the Students' Disciplinary Committee of the concerned School.

ASSAM DON BOSCO UNIVERSITY REGULATIONS POST GRADUATE DEGREE PROGRAMMES

HUMANITIES AND SOCIAL SCIENCES & COMMERCE AND MANAGEMENT

The following are the regulations of the Assam Don Bosco University concerning the Post- Graduate Programmes leading to the award of the Master's Degree in the disciplines of Humanities and Social Sciences & Commerce and Management made subject to the provisions of its Statutes and Ordinances: The Master's Degree Programmes of Assam Don Bosco University consist of theory and practicum components, taught and learned through a combination of lectures, field work/field visit and research projects.

1.0 Academic Calendar

- 1.1 Each academic year is divided into two semesters of approximately 18 weeks duration: an Autumn Semester (July – December) and a Spring Semester (January – June). The Autumn Semester shall ordinarily begin in July for students already on the rolls and the Spring Semester shall ordinarily begin in January. However, the first semester (Autumn, for newly admitted students) may begin later depending on the completion of admission formalities.
- 1.2 The schedule of academic activities approved by the Academic Council for each semester, inclusive of the schedule of continuing evaluation for the semester, dates for end-semester examinations, the schedule of publication of results, etc., shall be laid down in the Academic Calendar for the semester.

2.0 Duration of the Programme

- 2.1 The normal duration of the Post Graduate Programme in the disciplines of Humanities and Social Sciences & Commerce and Management shall be 4 semesters (2 years).
- 2.2 However, students who do not fulfil some of the requirements in their first attempt and have to repeat them in subsequent semesters may be permitted up to 4 more semesters (2 years) to complete all the requirements of the degree.
- 2.3 Under exceptional circumstances and depending on the merit of each case, a period of 2 more semesters (1 year) may be allowed for the completion of the programme

3.0 Course Structure

- 3.1 The choice based credit system shall be followed for the Masters Degree Programmes. Credits are allotted to the various courses depending on the number of hours of lecture/practicum/Field work assigned to them using the following general pattern:

3.1.1 Lecture: One hour per cycle/week is assigned 1 credit.

3.1.2 Practicum/fieldwork: Two hours per cycle/week is assigned 1 credit.

3.2 The courses are divided into two baskets – core courses and elective courses. (Core courses will include “Core Courses” and “Ability Enhancement Courses” mentioned in CBCS guidelines. Elective Courses will include “Discipline Specific Electives”, “Generic Electives”, optional “Dissertation or Project”, and “Skill Enhancement Courses”)

3.3 Core Courses: Core courses are those in the curriculum, the knowledge of which is deemed essential for students who are pursuing the programme.

3.3.1 A student shall be required to take all the core courses offered for a particular programme.

3.3.2 The number of credits required from core courses shall be as prescribed by the competent academic authority.

3.4 Elective Courses: These are courses in the curriculum which give the student opportunities for specialisation and which cater to his/her interests and career goals. These courses may be selected by the student and/or offered by the department conducting the programme, from those listed in the curriculum according to the norms laid down by the competent academic authority.

3.4.1 The number of credits which may be acquired through elective courses shall be prescribed by the Board of studies pertaining to the programme.

3.5 These categories of courses may further be subdivided into departmental, school or institutional, depending on the department which offers the course. The schema of categorisation of courses into baskets is as given below:

*Core Courses	
Departmental Core (DC)	Core courses which are offered by the department which conducts the programme
School Core (SC)	Core courses which are offered by a department other than the department which conducts the programme, from within the same School
Institutional Core (IC)	Core courses which are offered by departments of the University from Schools other than the parent School
*Elective Courses	
Departmental Elective (DE)	Elective courses which are offered by the department which conducts the programme
School Elective (SE)	Elective courses which are offered by a department other than the department which conducts the programme, from within the same School
Institutional Elective (IE)	Elective courses which are offered by departments of the University from Schools others than the parent School

***UGC Equivalent Courses** - Core Paper (DC), Ability Enhancement Compulsory Course (IC/ SC), Skill Enhancement Course (IE), General Elective (IE/SE), Discipline Specific Elective (DE)

- 3.6 In order to qualify for a Master's Degree, a student is required to complete the credit requirement as prescribed in the curriculum.
- 3.7 In addition to the prescribed credit requirement, a student shall have to complete the requirements of Extra Academic Programmes (EAP) as may be prescribed by the Department. Students shall be awarded P/NP grades for the EAP, which shall be recorded in the Gradesheet, but not taken into account for computing the SGPA and the CGPA.
- 3.8 Students who secure a CGPA of at least 7.5 at the end of the 2nd semester may opt to take one audit course per semester from any Department from the 3rd semester onwards, provided the course teacher permits the auditing of the course. This shall be done under the guidance of the Departmental Faculty Advisor/mentor. The student is free to participate in the evaluation process for such courses. However, an attendance of 75% percentage is necessary for obtaining a P grade for such courses. When auditing courses offered by other departments, it shall be the responsibility of the student to attend such courses without missing courses of one's own department and semester.
- 3.9 In addition, students may also opt for additional elective courses in consultation with their mentors. Students are required to participate in the evaluation process of such courses. The grades obtained for such courses shall be recorded in the gradesheet, but not taken into account for computing SGPA and CGPA.
- 3.10 It shall be the prerogative of the department to not offer an elective course which has less than 5 students opting for it.
- 3.11 The medium of instruction shall be English and examinations and project reports shall be in English.
- 3.12 The course structure and syllabi of the Post Graduate Degree Programmes shall be approved by the Academic Council of the University. Departmental Boards of Studies (DBOS) shall discuss and recommend the syllabi of all the courses offered by the department from time to time before forwarding the same to the School Board of Studies (SBOS). The SBOS shall consider the proposals from the departments and make recommendations to the Academic Council for consideration and approval.
- 3.13 The curriculum may include fieldwork / institutional visits / internship for a specified time. These are to be satisfactorily completed before a student is declared eligible for the degree. There shall be credit allocation for such activities. These activities may be arranged during the semester or during convenient semester breaks as shall be determined by the School Board of Studies.
- 3.14 Faculty Advisor/Mentor: A faculty advisor/mentor shall be assigned for groups of students. Faculty advisors/mentors shall help their mentees to plan their courses of study, advise them on matters relating to academic performance and personality development, and help them to overcome various problems and difficulties faced by them.

PROGRAMME SPECIFIC CURRICULAR ASPECTS

4.0 MASTER OF SOCIAL WORK (MSW)

- 4.1 Area of Concentration:** The third and fourth semesters shall have courses from a chosen Area of Concentration (AoC) from among those offered by the department. The AoC is to be opted for at the end of the second semester and will be confirmed by the department depending on the availability of seats and the aptitude and ability of the student. An AoC will be offered by the department only if a minimum of ten students opt for it. The fieldwork and research project of the third and fourth semesters will be based on the AoC.

4.2 Concurrent and Continuous Fieldwork

Fieldwork shall be an essential part of the course structure in all the semesters of the programme. The field work practice in the first semester shall consist of orientation visits, sessions for skills training and placement. In the first year, the focus of the field work shall be the community and in the second year the focus shall be based on the specialisation chosen by the students. In the first semester,, students shall be placed in communities, NGOs, service organizations and government agencies working with communities, and in those settings where they can be exposed to the community and community issues. The students get a close feel of the community and community settings, understand the dynamics and issues in the community and become aware of the sensitivities of people while working with them. They also get a firsthand experience of the programmes and

projects implemented in the communities by NGOs and government agencies and the impact that these have on the community. They shall also interact with the personnel from organisations and the community members to understand the tension between tradition and change that the communities in the region are likely to experience, and how it is handled. They shall, with the help of the organisation and the field work supervisor, identify an issue and work on it following the principles of community organization. The students are expected to be creative and innovative in assisting the agency and community in whatever way possible.

The field work practice in the second semester will consist of lab sessions for skills training and placement. The focus will be on the practice of social case work and Group works. The students shall be placed in NGOs, and government service organizations and government agencies working with individuals and families, and in those settings where they can be exposed to issues related to individuals and groups.

4.2.1 Normally a student shall spend fifteen hours over two days per week in field work. However, keeping in mind the peculiar situation of transport and communications in the region and the expenses involved, the field work practice may be arranged in other convenient ways as the institution deems fit.

4.2.2 The student is required to submit the report on the field work and the field work diary to the field work supervisor, before the commencement of classes on the first day of class following the field work days. The supervisor shall conduct regular field work conferences

4.2.3 A student is expected to have 100 percent attendance in field work. Any shortage shall be compensated by him/her.

4.2.4 At the end of the semester the student shall submit a summary report of the field work for the semester and a viva voce examination shall be conducted.

4.2.5 The field work practice in the Third and Fourth Semesters shall focus upon the Area of Concentration chosen by the students. The students shall be placed in the field for twenty five days of consecutive field work. The field work settings shall be communities, NGOs, service organizations, hospitals, clinics and governmental agencies. Those students who are specializing in Community Development will either be placed in an urban or rural community setting that is identified by the Department. Students who are specializing in Medical and Psychiatric Social Work will be exposed to either a Medical or a Psychiatric setting.

4.3 Rural Camp

Students shall organise and participate in a rural camp during the first / second semester. The duration of the rural camp shall generally be ten days excluding days of travel.

4.3.1 The objectives of the rural camp are:

To apply the acquired skills of group work and community organisation in communities.

To understand and assess the problems faced by the rural population.

To involve oneself positively in the communities to help to remove some of these problems.

4.3.2 At the end of the camp each student shall submit a written report to the department in a specified format. Performance at the Rural Camp shall be considered for the evaluation of the Field Work during the second semester.

4.3.3 The Rural Camp shall be credited along with the fieldwork of the semester along with which it can be conveniently coupled.

Study Tour

During the programme the students shall undertake a study tour along with the assigned faculty members to a place approved by the department. The places are to be so chosen as to be of educational benefit to students. During the tour, the focus shall be on visiting and interacting with as many NGOs/ state/national/international organisations involved in developmental work as possible. A report of the learning outcomes shall be submitted to the department at the end of the tour. The Study Tour shall be a Pass/No Pass course.

Block Placement

After the examinations at the end of the fourth semester, the students shall be placed with an NGO or Agency for a period of not less than one month for practical experience and application of their skills. While the Block Fieldwork is not credited, it is mandatory for the completion of the MSW programme. The student shall contact an agency of his/her choice and get the choice of agency approved by the department. Students shall endeavour to choose an agency that is primarily in tune with their AoC and which has credentials in the concerned field. At the end of every week the student shall send a brief report to the supervisor and at the end of the Block Field Work period a summary report shall be submitted. The summary report shall contain a short description of the Agency, the social service skills applied in his/her work and the student's learning outcomes. The report shall be submitted in a format prescribed by the department and shall be submitted together with a certificate from the agency confirming his/her field work, in a prescribed format.

Research Project Work

Every student shall undertake a research project work which has bearing on his/her AoC and present a written thesis on the research work under the supervision and guidance of a faculty member. The preliminary work may begin at the end of the second semester. The students are expected to complete the data collection before the fourth semester. The thesis is to be submitted to the department before the date notified. The student shall write a dissertation of the research thesis and appear for a viva voce examination on the research done. The mode and components of evaluation of the research work and the weightages attached to them shall be published by the Department/Institute at the beginning of the semester.

Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

5.0 MASTER OF SCIENCE (MSC) PSYCHOLOGY**5.1 Field Work**

Students shall take part in field work during the first three semesters in mental health agencies, medical institutions, educational institutions etc., under the supervision of professional counsellors and psychologists, where the student of psychological counselling can get a first-hand experience of the application of the learning derived from the classroom. The field work shall be credited and shall be evaluated using norms laid down by the department.

5.2 Study Tour

During the programme the students shall undertake a study tour, along with the faculty members, to a place approved by the department. The places are to be so chosen as to be of educational benefit to students. During the tour, the focus shall be to visit and interact with NGOs, hospitals, state/national/international organisations involved in psychological counselling. A report of the learning outcomes shall be submitted to the department at the end of the tour followed by a presentation. The Study Tour shall be a Pass/No Pass course.

5.3 Summer Internship

Students are required to undergo a summer internship of two weeks' during the semester break between the second and third semesters. It is a P/NP course and shall be recorded in the third semester. The Summer Internship gives students an opportunity to apply the theories and principles that they have learnt in class room courses to the "real world" of social service agencies, medical institutions, the criminal justice system, business, and industry. During the internship, students can explore career interests, develop professional skills, learn how community organizations work and expand their clinical and interpersonal skills. The summer internship enriches the students' academic experience while making a valuable contribution to the community and utilizing the vacation optimally.

5.4 Supervised Internship

Each student shall perform a supervised internship for a period of 90 days (spread across semester three and four with 45 days in each semester) in two organizations which offers counselling help to clients. The supervised internship is a credited course and the report for each internship shall be submitted by the students at the end of each semester followed by a presentation on the same. It shall be the prerogative of the department to propose the number of institutions where a student is expected to perform supervised internship. Supervision shall be provided for by the university in collaboration with the organisation where the student performs the internship. Evaluation of the internship shall be based on the documentation, reports from the organisation, report of the supervisor and the presentation and the viva voce examination of the student at the end of the period of Internship.

5.5 Research Project Work

A research project shall be undertaken during the course of the third and the fourth semesters. The topic of the research shall be so chosen that it will be possible for the student to pursue and complete the research work in the institution/hospital where the student is placed for the supervised internship. The preliminary work may begin at the end of the second semester. The students are expected to complete the data collection before the fourth semester. The thesis is to be submitted to the department before the date notified. The student shall write a dissertation of the research thesis and appear for a viva voce examination on the research done. The mode and components of evaluation of the research work and the weightages attached to them shall be published by the Department/ Institute at the beginning of the semester.

5.6 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A Group assignment shall be accompanied by a common presentation.

6.0 MASTER OF ARTS (MA) EDUCATION

6.1 Specialisations

The Master's Degree Programme in Education offers a number of specialisations, of which a student shall be required to choose a specialization after the completion of the first semester. The department shall have the prerogative of not offering a specialisation if a sufficient number of students do not opt for it.

6.2 Educational Seminar

During the course of the programme, students are expected to present a series of seminars which will address fundamental intellectual, conceptual and practical issues in current educational philosophy and application. They may also deal with other relevant topics which may be suggested by the department. Students shall be assisted through guest lectures, discussions, field work in education related institutions and active engagement with faculty members. During these interactions students shall be provided with an opportunity to explore how best to bring new interdisciplinary scholarship, technology and critical thinking into the development of the chosen seminar area. They shall also consider alternative pedagogic strategies, teaching techniques and technologies. Students shall prepare and present a final paper based on these seminars. Students shall be evaluated on the basis of the seminars and the final paper.

6.3 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

6.4 Research Project Work

Every student shall undertake a research project work which has bearing on his/her field of specialisation and present a written thesis on the research work under the supervision and guidance of a faculty member. The Research Project shall be undertaken individually, in two phases during the third

and fourth semesters. Students are expected to make presentations to the department at different stages of the research work. The student shall write a dissertation of the research thesis, submit it to the department and appear for a viva voce examination at times to be notified by the department. The mode and components of evaluation of the research work and the weightages attached to them shall be published by the Department/Institute at the beginning of the semester.

6.5 School Visits

The students of the Masters Programme in Education shall be engaged in regular school visits with the purpose of understanding and evaluating the process of teaching, learning and evaluation as well as the exigencies of administration of the school.

6.6 Internship

During the final semester of the programme, a student is required to undergo an internship for a period of one month. The internship provides an opportunity for students to experience the ground reality and connect it with the theoretical and methodological perspectives the student has studied and interiorized. During the internship the student will be monitored and guided by his/her supervisor and faculty members. The student will be required to maintain a journal and at the end of the period of internship, submit a written report and to make a presentation of his/her experiences and learnings at the internship. The student will be required also to submit a report from the head of the institution regarding his/her performance there.

The evaluation of the student shall be based on the level of his/her engagement during the internship in addition to his/her ability to communicate this engagement in the journal, the report and the presentation. The journal and the report are to be submitted within a month of the completion of the internship. The department shall specify the criteria for evaluating the journal, the report and the presentation.

6.7 Journaling

During the 1st semester, students shall maintain a reflective journal, to develop within them a reflection that can be described as an inner dialogue, using visible thinking routine (Harvard), as a critical structure for guiding their journal writing. Journaling has to be done six days a week. At the end, the student will be awarded grade/marks after assessing their learning.

7.0 MASTER OF ARTS (MA) MASS COMMUNICATION

7.1 Specialisations

The Master's Degree Programme in Mass Communication offers a number of specialisations, of which a student shall be required to choose a specialisation after the completion of the first semester. The department shall have the prerogative of not offering a specialisation if a sufficient number of students do not opt for it.

7.2 Media House Visits

During the course of the programme, students shall be required to visit a variety of Media Houses in small groups constituted by the department. The purpose of these Media House Visits shall be to gain exposure to the best practices among the day-to-day activities of the media house. A report of the visit is to be submitted in the format specified within two days of the visit. The Media House visit shall be a graded course and grades shall be awarded on the basis of the written reports of the media house visits.

7.3 Research Project Work

Every student shall undertake a research project work which has a bearing on his/her field of specialisation and present a written thesis on the research work under the supervision and guidance of a faculty member. The Research Project shall be undertaken individually, in two phases during the course of two semesters as shall be laid down in the course structure of the programme. Students are expected to make presentations to the department at different stages of the research work. The student shall write a dissertation of the research thesis, submit it to the department and appear for a viva voce examination at times to be notified by the department. The mode and components of evaluation

of the research work and the weightages attached to them shall be published by the Department/Institute at the beginning of the semester.

7.4 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

7.5 Internship

All students shall undergo an internship involving media related activities of four weeks' duration. The purpose of the internship is to give the students an opportunity to have a hands-on field experience to effectively put into practice the theoretical and practical learning from the programme in an area of interest. Students may undergo their internship in a media house of their choice. The student shall be required to discuss the choice of media house with the department and obtain its consent. Before going for the internship, a Letter of Consent from the concerned media house, in the prescribed format, shall be submitted by the student to the Department. After returning from the internship each student shall have to submit a detailed report in a prescribed format. Each student shall also make a presentation of the internship experience and learning in the Department and submit a certificate of successful completion of the internship from the designated authority of the concerned media house. The schedule of the conduct, report submission and evaluation of the internship shall be as notified by the Department. The components of evaluation of the Internship and their weightages shall be as notified by the department at the beginning of the semester.

7.6 Final Project

As a Final Project the students are required to create a Social Awareness and Community Development oriented multimedia project which shall culminate in a Media Event. The purpose of the final project is to showcase all the skills that the students have acquired during the course of the programme as well as demonstrate their Media and Event Management, and Media Entrepreneurship abilities and at the same time use these skills for the service and upliftment of the community. The Final Project shall essentially be a group project and the number of groups shall be specified by the department. The groups shall perform their activities under the guidance of faculty members who shall be assigned to guide each group. The last dates for the submission of the project proposal and the conduct of the event shall be notified by the Department well in advance. The components of evaluation of the Final Project and their weightages shall be as notified by the department at the beginning of the semester.

8.0 MASTER OF ARTS (MA) ENGLISH

8.1 Specialisations

The Master's Degree Programme in English offers a number of specialisations, of which a student shall be required to choose a specialisation after the completion of the second semester. The department shall have the prerogative of not offering a specialisation if a sufficient number of students do not opt for it.

8.2 Educational Seminar

During the course of the programme, students are expected to present a series of seminars related to English literature. They may also deal with other relevant topics which may be suggested by the department. Students shall prepare and present a final paper based on these seminars. Students shall be evaluated on the basis of the seminars and the final paper.

8.3 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

8.4 Dissertation

Students will be required to write a dissertation in the 4th semester.

9.0 MASTER OF (MA) PUBLIC ADMINISTRATION

9.1 Specialisations

The Master's Degree Programme in Public Administration offers a number of specialisations, of which a student shall be required to choose a specialisation. The department shall have the prerogative of not offering a specialisation if a sufficient number of students do not opt for it.

9.2 Project Work/Dissertation

The Master's Degree Programme in Public Administration will require students to do Project work in the 3rd and 4th semesters. The mode and components of evaluation of the project work and the weightages attached to them shall be published by the department at the beginning of the semester.

9.3 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

9.0 MASTER OF COMMERCE (MCOM)

9.1 Specialisations

The Master's Degree Programme in Commerce offers a number of specialisations, of which a student shall be required to choose a specialisation after the completion of the second semester. The department shall have the prerogative of not offering a specialisation if a sufficient number of students do not opt for it.

9.2 Project Work/Dissertation

The Master's Degree Programme in Commerce will require students to do Project work in the 3rd and 4th semesters. The mode and components of evaluation of the project work and the weightages attached to them shall be published by the department at the beginning of the semester.

9.3 Assignments

Assignments are an essential part of learning. The faculty shall engage students in a minimum of one individual and one group assignment per course, per semester. A group assignment shall be accompanied by a common presentation.

10.0 Admission

10.1 All admissions to the Post Graduate Degree Programmes of the University shall be on the basis of merit. There may, however, be provision for direct admission for a limited number of NRI/FN students.

10.2 Eligibility Criteria

10.2.1. To be considered for admission to a Post Graduate Degree Programme a candidate should have passed a Bachelor's Degree (or equivalent) programme of a recognised university securing 50% of the grades/marks.

10.2.2. Admission will be on the basis of the academic records of the candidate, and taking into consideration his/her performance in any or all of the following:

Written test

Group Discussion

Personal Interview

Candidates whose results for the qualifying examination are not yet declared may be provisionally admitted provided she/he submits proof of fulfilment of the eligibility criteria by 31 October of the year of provisional admission.

Bridge Courses: The Departments shall make provision for Bridge Courses to facilitate admission of students from varied backgrounds to a programme of their choice.

Value-added Courses: Each department shall offer value-added courses, which are optional. Certificates will be awarded to those who successfully complete the course.

Anti-Ragging Affidavit: Students and Parents Undertaking Affidavit In compliance of the UGC Regulations, it is compulsory for each student and every parent to submit an online Anti-Ragging undertaking affidavit every academic year. The Link to fill out the online undertaking affidavit by students and parents is:

www.antiragging.in/affidavit_registration_disclaimer.html

www.c4yindia.org/Home/Undertaking

11.0 University Registration

11.1 Candidates shall have to register as bona-fide students with the University as per the University regulations within a period specified by the University, by a formal application routed through the Director.

12.0 Attendance

12.1 To be permitted to appear for the end-semester examination of a particular course, a student is required to have a minimum attendance of 75% for that course.

12.2 Deficiency in attendance up to 10% may be condoned by the Director in the case of leave taken for medical and other grievous reasons, which are supported by valid medical certificates and other requisite documents.

12.3 Some students, due to exceptional situations like their own serious sickness and hospitalization or death of members of inner family circle, may have attendance below 65%. Such students may be given bonus attendance percentage for a particular course based on his/her attendance for that course during the remaining days of the current semester, as given in the following table:

Attendance during the remaining days of the current semester	Bonus percentage available in the current semester
95% or more	5
90% or more but less than 95%	4
85% or more but less than 90%	3
80% or more but less than 85%	2
75% or more but less than 80%	1

They shall be permitted to appear for the end-semester examination of the course if on the strength of this bonus attendance percentage, they obtain 65% attendance for that course.

12.4 If the sum of the credits of the courses for which a student is unable to appear at the end- semester examinations exceeds 50% of the total credits allotted for the semester, he/she shall not be permitted to appear for the entire endsemester examinations in view of clause 13.5 of these Regulations.

12.5 The School may decide to set aside a certain portion of the in-semester assessment marks for attendance. The number of marks and modalities of their allotment shall be made known to the students at the beginning of each semester.

12.6 Leave

12.6.1 Any absence from classes should be with prior sanctioned leave. The application for leave shall be submitted to the Office of the Director of the School on prescribed forms, through the Head of the Department, stating fully the reasons for the leave requested along with supporting documents.

12.6.2 In case of emergency such as sickness, bereavement or any other unavoidable reason for which prior application could not be made, the parent or guardian must inform the office of the Director promptly.

12.6.3 If the period of absence is likely to exceed 10 days, a prior application for grant of leave shall have to be submitted through the Director to the Registrar with supporting documents in each case; the decision to grant leave shall be taken by the Registrar on the recommendation of the Director.

12.6.4 The Registrar may, on receipt of an application, also decide whether the student be asked to withdraw from the programme for that particular semester because of long absence.

12.6.5 It shall be the responsibility of the student to intimate the concerned teachers regarding his/her absence before availing of the leave.

13.0 Grading System

13.1 Based on the performance of a student, each student is awarded a final letter grade in each graded course at the end of the semester and the letter grade is converted into a grade point. The correspondence between percentage marks, letter grades and grade points is given in the table below:

Marks obtained (x) o	Grade	Description	Grade Points
$90 \geq x \leq 100$	O	Outstanding	10
$80 \geq x < 90$	A+	Excellent	9
$70 \geq x < 80$	A	Very Good	8
$60 \geq x < 70$	B+	Good	7
$50 \geq x < 60$	B	Above Average	6
$41 \geq x < 50$	C	Average	5
$x = 40$	P	Pass	4
$x < 40$ F		Fail	0
	AB	Absent	0
	PS	Pass	0
	NP	Not Passed	0
	X	Not Permitted	0

In addition, a student may be assigned the grades 'PS' and 'F' for pass marks and non-passing marks respectively, for Pass/Nopass courses, or the grade 'X' (not permitted).

13.1.1 A student shall be assigned the letter grade 'X' for a course if he/she is not permitted to appear for the end semester examination of that course due to lack of requisite attendance.

13.1.2 A letter grade 'F' or 'X' in any course implies failure in that course.

13.1.3 A student is considered to have completed a course successfully and earned the credits if she/he secures a letter grade other than 'F' or 'X'.

13.2 At the end of each semester, the following measures of the performance of a student in the semester and in the programme up to that semester shall be computed and made known to the student together with the grades obtained by the student in each course:

13.2.1 The Semester Grade Point Average (SGPA): From the grades obtained by a student in the courses of a semester, the SGPA shall be calculated using the following formula:

$$SGPA = \frac{\sum_{i=1}^n GP_i \times NC_i}{\sum_{i=1}^n NC_i}$$

Where GP_i = Grade points earned in the i^{th} course
 NC_i = Number of credits for the i^{th} course
 n = the number of courses in the semester

13.2.2 The Cumulative Grade Point Average (CGPA): From the SGPA's obtained by a student in the completed semesters, the CGPA shall be calculated using the following formula:

$$CGPA = \frac{\sum_{i=1}^n SGP_i \times NSC_i}{\sum_{i=1}^n NSC_i}$$

Where SGP_i = Semester Grade point of the i^{th} semester
 NSC_i = Number of credits for the i^{th} semester
 n = the number of semesters completed

13.2.3 The CGPA may be converted into a percentage by multiplying CGPA by 10.

13.3 Both the SGPA and CGPA will be rounded off to the second place of decimal and recorded as such. Whenever these CGPA are to be used for official purposes, only the rounded off values will be used.

13.4 There are academic and non-academic requirements for the programme where a student will be awarded the 'P' and 'NP' grades. All non-credit courses (such as Study Tour and Extra Academic Activities) belong to this category. No grade points are associated with these grades and these courses are not taken into account in the calculation of the SGPA or CGPA. However, the award of the degree is subject to obtaining a 'P' grade in all such courses.

14.0 Assessment of Performance

14.1 A student's performance is evaluated through a continuous system of evaluation comprising tests, quizzes, assignments, seminars, projects, research work, concurrent and block field work performance and end-semester examinations.

14.2 Theory Courses: Theory courses will have two components of evaluation – in-semester assessment of 40% weightage and an end-semester examination having 60% weightage.

14.2.1 The modalities of conduct of in-semester evaluation, its components and the weightages attached to its various components shall be published by the department concerned at the beginning of each semester.

14.3 Practicum/Field Work/Lab: These courses shall be evaluated on the basis of attendance, performance of tasks assigned and an end semester test/viva voce examination. The weightage assigned to these components of the evaluation is given in the following table:

Component	Weightage
Attendance	10
Performance of tasks assigned	30
End-semester test / viva voce examination	60

14.4 End-Semester examinations

14.4.1 End-semester examinations, generally of three hours' duration, shall be conducted by the University for the theory courses. However, the Director of the Institute shall make the arrangements necessary for holding the examinations.

14.4.2 In the end-semester examinations, a student shall be examined on the entire syllabus of the courses.

14.4.3 A student shall not obtain a pass grade for a course without appearing for the end- semester examination in that course.

14.5 The evaluation of performance in Co-curricular Activities will be done by the authorities conducting them and they will communicate the grades to the Director who will forward them to the Controller of Examinations of the University. 14.6 The Director will forward the marks obtained in the in-semester evaluation to the Controller of Examinations within the prescribed time as may be notified.

14.7 All evaluated work in a subject except the end semester answer scripts will be returned to the students promptly. They should be collected back after the students have examined them, and preserved for a period of one semester.

14.8 Eligibility for appearing in the end-semester examinations: A student will be permitted to appear for the end-semester examinations, provided that

14.8.1 A student has not been debarred from appearing in the end semester examinations as disciplinary action for serious breach of conduct.

14.8.2 He/she has satisfactory attendance during the semester according to the norms laid out in section 9 of these regulations.

14.8.3 He/she has paid the prescribed fees or any other dues of the university, institute and department within the date specified.

14.9 Registration for end-semester Examinations

14.9.1 The University shall, through a notification, invite applications from students to register for the end-semester examinations.

14.9.2 Students who have registered with the University and those who have applied for such registration may apply to appear for the end-semester examinations of the university, in response to the notification issued by the University, provided that they fulfil the eligibility norms as laid down in clause 14.8.

14.9.3 All eligible candidates shall be issued an admit card for the relevant examination and for the specified courses. A student who does not have a valid admit card may not be permitted to write the end-semester examinations.

14.9.4 A student who secures an 'F' or 'X' grade in any course in a semester may register for the end-semester examination for that course in a subsequent semester when that course is offered again, within the maximum period of time allotted for the completion of the programme. The in-semester assessment marks obtained by him/her in the last semester in which the said course was attended by him/her shall be retained.

14.9.5 Similarly, in case of an 'NP' grade in Extra Academic Programmes the student shall have to re-register for it in the appropriate semester of the next academic session.

14.9.6 When a student re-registers for the end semester examination of a course, in accordance with clause 14.9.4 above, the better of the two grades obtained (the old and the new) shall be considered for the calculation of SGPA and CGPA.

14.10 Conduct of Examinations: The University shall conduct the end-semester examinations in accordance with the applicable regulations on such dates as are set down in the Academic Calendar or as notified.

14.11 Declaration of Results: The University shall declare the results of a semester and make available to the students their grade sheets within the time-frame prescribed by the relevant regulations of the university and specified in the academic calendar.

14.11.1 The University may withhold the results of a student for any or all of the following reasons

he/she has not paid his/her dues

there is a disciplinary action pending against him/her

he/she has not completed the formalities for University Registration according to the requirement of section 6 of these Regulations.

14.12 Re-examining of answer scripts

If a student feels that the grade awarded to him/her in a course is not correct, he/she may apply to the University for the re-examining of his/her answer script.

Re-examining of scripts may be of two different categories – scrutiny and re-evaluation.

Scrutiny: The activities under this category shall ordinarily be confined to checking

correctness of the total marks awarded and its conversion into appropriate letter grades whether any part/whole of a question has been left unevaluated inadvertently correctness of transcription of marks on the tabulation sheet and the grade sheet issued in respect of the course under scrutiny.

Re-evaluation: Re-evaluation of the answer script by independent experts in the concerned subject(s).
Application for re-examining of answer scripts

A student may apply for scrutiny or re-evaluation for one or more courses of the just- concluded end semester examinations within seven calendar days from the date of publication of its results in the application form prescribed for this purpose.

He/she shall pay the prescribed fee to the University as notified.

A student applying for scrutiny/re-evaluation shall expressly state on the application form whether the application made is for Scrutiny or for Re- evaluation. In each case, the student may also request to see his/her answer script.

All applications for scrutiny/re-evaluation must be routed through the Director of the Institute.

If in the process of re-examining, the grade obtained in a course changes, the better of the two grades shall be assigned to the course. If there is a change, the new grade shall be recorded and a new grade sheet shall be issued to the student.

Without prejudice to any of the clauses of section 14.12, a student who has been found to have used unfair means during an examination shall not be eligible to apply for scrutiny or re-evaluation of answer scripts.

Repeat Examination: The University shall conduct repeat examination for those with F grade at a different time slot, as set down in the Academic Calendar or as notified. Such students should register for these examinations.

Improvement Examination

After the completion of the entire programme of study, a student may be allowed the provision of improvement examinations. These are to be availed of only once each in the Autumn and Spring semesters that immediately follow the completion of the programme, and within the maximum number of years permissible for the programme.

A student may choose no more than six courses (three in the Autumn semester and three in the Spring semester) for improvement examinations.

After the improvement examination, the better of the two grades obtained (the old and the new) shall be considered for the calculation of SGPA and CGPA.

If the student improves his/her grades through the improvement examination, new grade sheets and comprehensive transcripts shall be issued to the student.

14.15 Special Examination

14.15.1 The University shall conduct Special Examinations to benefit the following categories of students:

Students who, on the completion of the final semester, have some 'F' graded courses in the two final semesters, but no 'F' or 'X' graded courses in any of the previous semesters

Students who have only one 'F' graded course in a semester other than the two final semesters and do not have 'F' or 'X' graded courses in the two final semesters.

The Special Examinations shall ordinarily be conducted each year within a month of the declaration of the results of the Spring Semester.

Students who fail to secure 50% of the credits offered in the final semester shall not be eligible to appear for the special examinations. Such students will be governed by the provisions of clause 15.5 of these regulations. However, this restriction shall not apply in the case of students who are unable to appear in the end semester examinations due to exceptional situations like their own serious illness and hospitalisation or death of members of inner family circle (restricted to only father, mother, siblings).

Students who have 'X' graded courses only in the last two semesters may be offered the opportunity for participating in a Tutorial Programme which may be conducted during the semester break immediately following the end- semester examinations of the final semester and students who earn 85% attendance for the programme shall be permitted to appear for the Special Examinations. Separate fees shall be charged for the Tutorial Programme.

Students who do not obtain pass grades in any course at the special examinations shall have to apply in the prescribed format and appear for the end-semester examination of these courses when they are scheduled by the University during subsequent relevant end-semester examinations.

15.0 Enrolment (for semesters other than the first)

- 15.1 Every student is required to enrol for the programme through the designated officer at the commencement of each semester on the days fixed for such enrolment and notified in the Academic Calendar.
- 15.2 Students who do not enrol on the days announced for the purpose may be permitted late enrolment up to the notified day in the Academic Calendar on payment of a late fee.
- 15.3 Only those students will be permitted to enrol who have
 - 15.3.1 cleared all University, Institute, Department, Hostel and Library dues and fines (if any) of the previous semester,
 - 15.3.2 paid all required University, Institute, Department and Hostel fees for the current semester, and
 - 15.3.3 not been debarred from enrolling on any specific ground.
- 15.4 No student may enrol for a semester if he/she has not appeared, for whatever reason, in the end semester examinations of the previous semester.
- 15.5 A student who fails to obtain 50% of the credits offered in the third and subsequent semesters shall not be permitted to enrol for the next semester and shall have to re-enrol for and attend all the courses of the said semester in the following academic year. Students who due to X grade (lack of due attendance) have been debarred from exams in any semester (including first and second) will have to re-enrol for the same.

16.0 Eligibility for the Award of Degree

- 16.1 A student shall be declared to be eligible for the award of the degree if he/she has
 - 16.1.1 completed all the credit requirements for the degree with grade 'C' or higher grade in each of the graded courses and grade 'P' in all the non-graded courses.
 - 16.1.2 satisfactorily completed all the non-credit requirements for the degree (if any);
 - 16.1.3 obtained a CGPA of 5.00 or more at the end of the semester in which he/she completes all the requirements for the degree;
 - 16.1.4 owes no dues to the University, Institute, Department, Hostels; and
 - 16.1.5 has no disciplinary action pending against him/her.
- 16.2 The award of the degree must be recommended by the Academic Council and approved by the Board of Management of the University.

17.0 Termination from the Programme

- 17.1 If more than the number of years permitted for the completion of a programme have elapsed since the student was admitted, and the student has not become eligible for the award of Degree, the student shall be removed from the programme.
- 17.2 A student may also be required to leave the Programme on disciplinary grounds on the recommendations of the Students' Disciplinary Committee of the concerned School.

SCHEME OF IN-SEMESTER EVALUATION
POST GRADUATE DEGREE PROGRAMMES
M.TECH, MCA, MSW, MSC, MA and MCOM

THEORY COURSES

The different components of the scheme of in-semester for the theory courses are given in the table below:

Component	Weightage
Class Test (Two class tests of equal weightage)	20
Assignments, Group Presentations/Seminar	10
Non-formal evaluation	5
Attendance	5
Total	40

Non-formal Evaluation

Non-formal evaluation may be done using a combination of quizzes, unannounced tests, open book tests, library work reports, class room interaction and participation, etc. The scheme of non-formal evaluation shall be announced by every teacher in the beginning of the semester.

Attendance

Marks for attendance will be given according to the following scheme:

Attendance Percent (x)	Marks Allotted
$75 \leq x < 80$	2
$80 \leq x < 90$	3
$90 \leq x < 95$	4
$95 \leq x \leq 100$	5

NB: There shall be no re-test for in-semester Assessment under any circumstance. The original marks of all the in-semester Assessment components shall be retained for all further repeat examinations.

MCA Minor Project

The guidelines for the conduct and evaluation of the MCA Minor Project shall be laid down by the Department. The components of evaluation and allotment of marks will be as follows:

In Semester Evaluation	Marks	End Semester Evaluation (Weightage 40)	Marks
Synopsis	10	Project Implementation	16
Seminar presentation of synopsis (Analysis and Design)	15	Seminar Presentation	8
Progress Seminar (Implementation)	15	Viva Voce Examination	16
Project Documentation	10		
Attendance	10		
Total	60		40

In-Semester Evaluation of MCA Major Project

The in-semester evaluation of the MCA Major Project shall have 60% weightage. The Internal Evaluation of the Major project will be done through two seminar sessions:

Synopsis	:	20
Seminar Presentation of Synopsis (Analysis and Design)	:	30
Progress Seminar (Implementation)	:	30
Project Documentation	:	20

External Evaluation of all Major projects will follow the guidelines laid down in the Regulations.

MSW, MSc Psychology Field Work

The components of evaluation and their weightages for the concurrent/continuous fieldwork are as follows:

Component	Weightage
Field Work Diary	10
Agency Evaluation	15
Faculty Evaluation	20
Attendance	5
Viva Voce Examination	50
Total	100

Practicum

Field Report	:	15
Presentation	:	15
Administration of tests	:	10
Faculty Evaluation	:	10
Viva Voce Examination	:	50

MSW, MSc Psychology Research Project

Phase I

Literature Survey Presentation	:	40
Synopsis Presentation	:	60

Phase II

Examination of Thesis	:	50
Presentation and Viva Voce Exam	:	50

MTECH, MSC (Physics, Chemistry, Mathematics, Biochemistry, Biotechnology, Microbiology, Botany, Zoology) THEORY COURSES

For theory courses, in-semester assessment carries 40% weightage. Different components along with the weightage of each are given in the table below:

Component	Weightage	Remarks
Class Test (Two Class tests of one and a half hour duration)	20	Average of the two marks shall be considered
Assignments	15	Written Assignments/Seminar on course Topics/ Technical Paper Review
Non-formal evaluation	5	Based on response and interaction in class, quizzes, open book tests, etc.
Total	40	

There shall be no re-test for In-semester assessment under any circumstance. The original marks of all the In-semester assessment components shall be retained for all further repeat examinations.

In-Semester Evaluation of Project (Phase I) / Research Project (Phase I) / Dissertation (Phase I)

The in-semester evaluation of Project Phase I / Research Project (Phase I) / Dissertation (Phase I) shall have 60% weightage. It shall be evaluated in the following seminar sessions having equal weightage:

Seminar 1: Presentation of the synopsis

Synopsis	:	30%
Seminar presentation of the synopsis	:	50%
Viva voce examination	:	20%

Seminar 2: Progress Seminar

Progress report	:	30%
Progress seminar	:	50%
Viva voce Examination	:	20%

In-Semester Evaluation of Project (Phase II) / Research Project (Phase II) / Dissertation (Phase II)

The in-semester evaluation of Project Phase II / Research Project (Phase II) / Dissertation (Phase II) shall have 60% weightage. The in-semester evaluation will be done through two seminar sessions having equal weightage. Each seminar will be evaluated using the following components.

Progress Report	:	30
Progress Seminar	:	50
Viva Voce Examination	:	20

External Evaluation of the project / Research Project / Dissertation shall follow the guidelines laid down in the Regulations.

RULES, PROCEDURES AND BEHAVIOURAL GUIDELINES***1. Dress Code and Identity Card***

- 1.1 The dress code of the University consists of shirt / top (of the prescribed colour and material), trousers (of the prescribed colour and material), shoes (black) and socks (dark grey), a belt (black/dark brown, if required) and a tie (blue, with diagonal stripes). Students are required to come to the University following this dress code. The tie will be required to be worn only on formal occasions. An apron (of the prescribed colour) is to be worn in the Chemistry Lab and during Workshop Practice. During winter, students may wear only a blazer and/or a sweater (full sleeve or sleeveless) of the prescribed colour and material.
- 1.2 The Student Identity Card is to be brought to the University every day and is to be produced whenever asked for. Entry to the University campus shall be only on production of the Identity Card. The Identity Card is also the Library Card.
- 1.3 All students should wear the ID card around the neck from entry in the morning to exit in the evening.

2. Morning Assembly

- 2.1 The morning assembly is a daily programme in the university on all class days during which all members, i.e., students, faculty, staff and management meet together. The assembly starts at the prescribed time. During the assembly, important announcements are made and a thought or insight is shared. The assembly is concluded with an invocation to God to bless the activities of the day. Note that any announcement made at the morning assembly is considered as being equivalent to notifying the same in the notice boards. All students should reach the assembly venue before prescribed time. Immediately after assembly all should proceed to the classroom to start class. Any change in procedures will be notified by the concerned School at the beginning of the Semester.
- 2.2 One of the following prayers may be used to conclude the Morning Assembly:

The Our Father

*Our Father, who art in heaven,
Hallowed be thy name, Thy kingdom come, Thy will be done on earth as it is in heaven.
Give us this day, our daily bread
And forgive us our trespasses
As we forgive those who trespass against us. And lead us not into
temptation, But deliver us from all evil, Amen.*

Or

*Prayer for Peace
Lord, make me an instrument of
your peace, where there is hatred,
let me sow love; where there is
injury, pardon; where there is
doubt, faith; where there is despair,
hope; where there is darkness,
light; where there is sadness, joy;
O Divine Master, grant that I may not so much seek to be con-
soled as to console; to be understood as to understand; to be
loved as to love.
For it is in giving that we re-
ceive; it is in pardoning that we
are pardoned;
and it is in dying that we are born to eternal life. Amen*

3. Punctuality in Attending Classes

- 3.1 All are expected to be at their respective assembly venues five minutes before assembly time.
- 3.2 Normally no student shall leave the University before all the classes are over. In case of an emergency, a student may leave with proper written permission from the HOD of the concerned department.

4. Make-up Classes, Leave of Absence and Earned Attendance

- 4.1 If any student misses any laboratory class due to illness or other grievous problems, he/she is required to meet the concerned teacher for completing the experiments as soon as possible. Such make-up attendance will be taken into consideration at the end of the semester if attendance is less than 75%. At most two make-up attendances may thus be earned by any student.
- 4.2 Any student who is required to be engaged in a University activity or a pre-planned training and placement activity during class hours, may apply for the grant of an 'earned attendance' from the concerned HODs in the prescribed form available at the Reception. Such applications must be forwarded by the Activity In-Charge. For club related activities, Faculty Advisor of the concerned club will be the Activity In-Charge. In all other cases, Faculty In-Charge or Assistant Faculty In-Charge of Student Affairs will be the Activity In-Charge. Filled up forms shall be submitted preferably before or in case of emergency, immediately after the activity for which earned attendance is to be granted.
- 4.3 Any student going to participate in any activity or competition outside the University must apply to the Faculty In-Charge of student Affairs using the prescribed form which must be forwarded by the Assistant Faculty In-Charge of Student Affairs in consultation with respective Club Advisers. On return, these students must report back to the Assistant Faculty In-Charge of Student Affairs for recording the outcome.
- 4.4 Any student who is not able to attend classes due to medical or other grievous reasons are required to apply for leave in the prescribed form along with valid medical certificates and other requisite documents, to the Faculty In-charge, students' affairs within seven days of joining back. Such applications must be signed by a parent of the student and forwarded by the mentor of the concerned student and the HOD of the concerned department. Only these students will be considered for condonement of deficiency in attendance.

5. Discipline

- 5.1 Personal, academic and professional integrity, honesty and discipline, a sense of responsibility and a high degree of maturity is expected of all students inside and outside the campus. Integrity calls for being honest in examinations and assignments, avoiding plagiarism and misrepresentation of facts.
- 5.2 Indulging in acts of violence, riotous or disorderly behaviour directed towards fellow students, faculty members or other employees of the institution/hostel in the campus or outside is considered to be a serious breach of discipline and will attract penalty.
- 5.3 Respect for Common Facilities: Care and respect for common facilities and utilities are an essential component of social responsibility. Any willful damage to University property must be made good by the persons concerned. Further, maintaining cleanliness of the classrooms and the entire campus is everyone's responsibility.
- 5.4 Substance Abuse: Chewing of tobacco, betel nut and the likes, smoking and the use of other addictive substances and alcoholic drinks are strictly prohibited. These should not be brought into or used within the campus of the University. Violation of this norm will lead to stern action.
- 5.5 Use of Cell Phones: Cell phones may be used in the University lawns, canteens and other open areas. However, the use of cell phones in classrooms and labs are strictly prohibited except when used for teaching/learning purposes with the explicit permission of the teacher concerned. The cell phone of anyone found violating this rule shall be confiscated and his/ her SIM card shall be taken away and retained in the University office for 7 days. If a person violates the norm for a second time, his/her mobile will be confiscated and retained in the University office till the end of the semester.
- 5.6 Use of Internet: The entire campus is wi-fi enabled and the students may use the Internet freely for educational purposes. Students may also use the Computing Centre for browsing the Net. However, the use of Internet to access unauthorized and objectionable websites is strictly prohibited.
- 5.7 All cases of indiscipline will be brought before the Students' Disciplinary Committee and the decisions made by the Committee for dealing with such cases shall be final.

6. Class Tests and Examinations

- 6.1 The conduct of examinations will be governed by the norms of the University.
- 6.2 The Student Identity Card shall be the Admit Card for the class tests
- 6.3 During class tests, all students are expected to enter the venue of the class test 15 minutes before the scheduled time of commencement. However, no one will be permitted into the examination hall after 15 minutes of the commencement of the class test and No one will be allowed to leave the examination hall until an hour has elapsed from the commencement of the class test.
- 6.4 No one is to leave the hall during examination for any purpose, except in case of an emergency.
- 6.5 Malpractices during class tests and examinations will not be tolerated and will attract stern action.

7. Ragging

Ragging and eve-teasing are activities which violate the dignity of a person and they will be met with zero tolerance. Antiragging norms have been given to each student at the time of admission and all students and parents have signed the antiragging affidavit. Any case of ragging and eve-teasing must be reported to the anti-ragging squad. All cases of violation of antiragging norms will be taken up by the anti-ragging Committee and punished according to the norms.

8. Grievance Redressal

The University has constituted a Grievance Redressal Cell to redress any genuine grievance students may have. Any student having a genuine grievance may make a representation to the Grievance Redressal Cell through his/her mentor. The representation should be accompanied by all relevant documents in support of the genuineness of the grievance.

9. School Association

- 9.1 The School Association is an association of the representatives of the various stake holders of the School – students, staff, faculty and management. It is the responsibility of the School Association to

take charge of organizing most of the co-curricular activities such as the annual festivals, quizzes, debates, competitions and social events.

- 9.2 A male and a female student are elected by the students of each class as “class representatives” to represent them in the School Association. Class representatives are expected to be outstanding students who are academically competent and having qualities of leadership.

10. Participation in University Activities

- 10.1 In order to provide opportunities for the holistic development of the human person, a large number of co-curricular and extra-curricular activities are designed and implemented under the banner of the University Association and student clubs. Some of the most important activities are D'ERVE & BOS-COSIADE (intra- University sports and cultural festival during University Week), PRAJYUKTTAM (the inter-University technical festival). All students are expected to take part actively in such activities to showcase their talents, to develop leadership qualities and to gain the experience of working in groups.
- 10.2 **Training and Placement Activities:** The training and Placement Cell of DBCET has been incorporated with the objective of minimizing the gap between industry and academia and giving the students training and exposure so that they can capitalize on every opportunity for placement. It is the prime responsibility of the cell to look after all matters concerning ‘Training to enhance employability’ and ‘guiding students for placement’. In the first two semesters, students are trained for communication skills development under the department of Humanities and Social Sciences, and personal development programmes under the department of campus ministry. From the third semester onwards, in every semester, students are given systematic training in aptitude tests, communication skills, group discussion, etc. They are also made to undergo mock HR and Technical Interviews. These activities of the training and placement cell find a place in the curriculum as Extra Academic Programmes (EAP) and all students are required to get a P grade for these activities by taking an active part in these activities regularly.

Other departments of the University offer customised services in training and placement of their students.

11. Free Time

Some hours without class may be available for some students during the day. Students are expected to use such ‘free time’ for visiting the library, meeting teachers and mentors, self-study, carrying out lab or project related activities, etc.

12. Faculty Performance Feedback

In order to improve the teaching and learning process in the University, students will be required to give feedback about the performance of their teachers from time-to-time. All students are expected to participate in the online feedback sessions concerning their teachers with sincerity and responsibility.

13. Mentoring

All students are assigned mentors from among the faculty members for their guidance. Directors of Schools in collaboration with the Heads of Departments will take care of assigning mentors. Mentors shall help the students to plan their courses of study, advise them on matters relating to academic performance and personality development, and help them to overcome various problems and difficulties faced by them. Although students should meet their mentors on a regular basis to get timely help, specific days have been set aside in the calendar for meeting mentors to ensure proper documentation of achievements, activities, shortcomings and problems faced by the students. Every student must meet the mentor during these days.

14. Interaction Meet with Parents

The University organises interaction meetings with parents once a year in which the parents are invited to interact with teachers and management to appraise themselves about the performance of their ward and also to offer their suggestions for the betterment of the institution. It is the responsibility of the students too to invite their parents to come and participate in the event and make the event meaningful.

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING**PROGRAMME: MASTER OF TECHNOLOGY (MTECH) COMPUTER SCIENCE AND ENGINEERING**

SEMESTER I						
Type	Category	Course Code	Course Name	L-T-P	Credits	Page No

Course from Swayam

Program Outcomes

PO1:An understanding of the theoretical foundations and the limits of computing

PO2: An ability to adapt existing models, techniques, algorithms, data structures, etc. for efficiently solving problems

PO3:An ability to design, develop and evaluate new computer based systems for novel applications which meet the desired needs of industry and society

PO4:Understanding and ability to use advanced computing techniques and tools

PO5:An ability to undertake original research at the cutting edge of computer science & its related areas

PO6:An ability to function effectively individually or as a part of a team to accomplish a stated goal

PO7:An understanding of professional and ethical responsibility

PO8:An ability to communicate effectively with a wide range of audience

PO9:An ability to learn independently and engage in life long learning

PO10:An understanding of the impact of IT related solutions in an economic, social and environment context.

Program specific outcome(PSO)

Specialisation: Data science

PSO1:Apply the concept of theoretical knowledge of computer science, data structures, algorithms, mathematical computation and statistical formulae with respect to research methodology.

PSO2:Develop programs that use data mining techniques on bigdata for clustering, classification and ranking using cloud infrastructure for research.

Specialisation: Internet of Things

PSO1: Apply the concept of theoretical knowledge of computer science, data structures, algorithms, mathematical computation and statistical formulae with respect to research methodology.

PSO2:Design and develop code for various sensor-based applications for different sectors that use data collected through IoT deployment.

Specialisation: Information Security

PSO1: Apply the concept of theoretical knowledge of computer science, data structures, algorithms, mathematical computation and statistical formulae with respect to research methodology.

PSO2: Design operational and strategic cyber-security strategies, policies, and solutions that use cyber security techniques, information assurance, digital forensics software/tools, encryption, machine learning, and secure coding for securing data.

Detailed Syllabus

CSMF0086: MATHEMATICAL FOUNDATION OF COMPUTER SCIENCE

(3 credits)

Objectives

To understand the mathematical fundamentals that are prerequisites for a variety of courses like Data mining, Network protocols, analysis of Web traffic, Computer security, Software engineering, Computer architecture, operating systems, distributed systems, Bioinformatics, Machine learning.

To develop the understanding of the mathematical and logical basis to many modern techniques in information technology like machine learning, programming language design, and concurrency.

To study various sampling and classification problems.

Course Outcomes

Define and Recall the basic notions of discrete and continuous probability (Remembering)
Explain the methods of statistical inference, and the role that sampling distributions play in those methods (Understanding).
Apply discrete mathematics in formal representation of various computing constructs. (Applying)
Analyse the recent trends in distribution functions in various interdisciplinary fields (Analysing)
Evaluating the basic notions of Mathematics in the application areas of Computer Science & Engineering (Evaluating).
Elaborate the importance of analytical problem solving approach in engineering problems (Creating).

Module I (7 hours)

Probability mass, density, and cumulative distribution functions, parametric families of distributions, Expected value, variance, conditional expectation, Applications of the univariate and multivariate Central Limit Theorem, Probabilistic inequalities, Markov chains

Module II (7 hours)

Random samples, sampling distributions of estimators, Methods of Moments and Maximum Likelihood

Module III (8 hours)

Statistical inference, Introduction to multivariate statistical models: regression and classification problems, principal components analysis, The problem of overfitting model assessment.

Module IV (9 hours)

Graph Theory: Isomorphism, Planar graphs, graph colorings, Hamilton circuits and Euler cycles. Permutations and Combinations with and without repetition. Specialized techniques to solve combinatorial enumeration problems.

Module V (10 hours)

Computer science and engineering applications: Data mining, Network protocols, analysis of Web traffic, Computer security, Software engineering, Computer architecture, operating systems, distributed systems, Bioinformatics, Machine learning.

Module VI (4 hours)

Recent Trends in various distribution functions in the mathematical field of computer science for varying fields like bioinformatics, soft computing, and computer vision.

Suggested Readings

John Vince, Foundation Mathematics for Computer Science, Springer.
K. Trivedi. Probability and Statistics with Reliability, Queuing, and Computer Science Applications. Wiley.
M. Mitzenmacher and E. Upfal. Probability and Computing: Randomized Algorithms and Probabilistic Analysis.
Alan Tucker, Applied Combinatorics, Wiley

CSDT0087: ADVANCED DATA STRUCTURES

(3 credits)

Objectives:

The student should be able to choose appropriate data structures, understand the ADT/libraries, and use it to design algorithms for a specific problem.
Students should be able to understand the necessary mathematical abstraction to solve problems.
To familiarize students with advanced paradigms and data structure used to solve algorithmic problems.
Students should be able to come up with analysis of efficiency and proof of correctness.

Course Outcomes

Recall the mathematical background and abstractions for analysis of algorithms. (Remembering)
 Explain the implementation of symbol tables using hashing techniques. (Understanding)
 Apply amortized analysis on data structures, including binary search trees, mergeable heaps, and disjoint sets. (Applying)
 Develop and Analyse algorithms for red-black trees, B-trees and Splay trees. (Analysing)
 Develop and evaluate algorithms for text processing applications. (Evaluating)
 Choose suitable data structures and develop algorithms for computational geometry problems. (Creating)

Module I (7 Hours)

Dictionaries: Definition, Dictionary Abstract Data Type, Implementation of Dictionaries.
 Hashing: Review of Hashing, Hash Function, Collision Resolution Techniques in Hashing, Separate Chaining, Open Addressing, Linear Probing, Quadratic Probing, Double Hashing, Rehashing, Extendible Hashing.

Module II (5 Hours)

Skip Lists: Need for Randomizing Data Structures and Algorithms, Search and Update Operations on Skip Lists, Probabilistic Analysis of Skip Lists, Deterministic Skip Lists

Module III (7 Hours)

Trees: Binary Search Trees, AVL Trees, Red Black Trees, 2-3 Trees, B-Trees, Splay Trees

Module IV (11 Hours)

Text Processing: String Operations, Brute-Force Pattern Matching, The Boyer-Moore Algorithm, The Knuth-Morris-Pratt Algorithm, Standard Tries, Compressed Tries, Suffix Tries, The Huffman Coding Algorithm, The Longest Common Subsequence Problem (LCS), Applying Dynamic Programming to the LCS Problem.

Module V (10 Hours)

Computational Geometry: One Dimensional Range Searching, Two Dimensional Range Searching, Constructing a Priority Search Tree, Searching a Priority Search Tree, Priority Range Trees, Quadrees, k-D Trees.

Module VI (5 Hours)

Recent Trends in Hashing, Trees, and various computational geometry methods for efficiently solving the new evolving problem

Suggested Readings

Mark Allen Weiss, Data Structures and Algorithm Analysis in C++, 2nd Edition, Pearson, 2004.
 M T Goodrich, Roberto Tamassia, Algorithm Design, John Wiley, 2002.

ECRM0042: RESEARCH METHODOLOGY AND INTELLECTUAL PROPERTY RIGHT**(2 credits)**

Objective: This course is designed to help students to identify research problems in various fields. It aims at giving potential researchers the knowledge of effectively analysing and interpreting results and presenting the findings to the scientific and technological community of the world. This course also aims at motivating students to bring about their creative ideas for innovation and establishing research impact in the global arena through intellectual ownership.

Course Outcomes

- To be able to identify research problems in various fields
- To be able to approach investigations scientifically in order to find solutions for research problems of interest
- To know how to undertake literature review for knowing the state of the art in the areas of interest
- To know how to put forward the research problems, findings, analyses and interpretations effectively
- To know how to take ownership of new findings through intellectual property right laws

Module I: Research problem formulation and solution (12 Hours)

Meaning, sources, scope and objective of a research problem; Good research problem criteria and characteristics, errors in selecting a research problem; Research problem solutions— approaches for investigation; Approaches to effective literature studies; Data collection, analysis, interpretation and instrumentation; Plagiarism and ethical practices.

Module II: Technical writing (10 Hours)

Effective writing; Research proposal development and its format; Different report types.

Module III: Intellectual Property Rights (8 Hours)

Nature of intellectual property: Patent, design, trade and copyright; Patenting and development process; Patent grant under PCT and procedure; Geographical indications.

Patent rights: Administration of patents systems, scope, information and databases, technology licensing, New developments and case studies.

Suggested Readings

Goddard Wayne, Melville Stuart, Research Methodology: An Introduction For Science And Technology Students, Juta & Co.Ltd.
 Kumar Ranjit, Research Methodology A Step By Step Guide For Beginners, SAGE publications Inc.
 Halbert J. Debora, Resisting Intellectual Property, CRCpress.
 Menell S. Peter, Lemley A. Mark, Merges P. Robert, Intellectual Property In New Technological Age, Clause 8 Publishing.
 C.R. Kothari, Research Methodology Methods and Techniques, New Age International

CSSC0088: DATA SCIENCE**(3 credits)****Objectives:**

- Provide you with the knowledge and expertise to become a proficient data scientist.*
- Demonstrate an understanding of statistics and machine learning concepts that are vital for data science*
- Produce Python code to statistically analyse a dataset*
- Critically evaluate data visualisations based on their design and use for communicating stories from data*

Course Outcomes

- Define the basics of the knowledge and expertise required to become a proficient data scientist. (Remembering)
- Demonstrate an understanding of statistics and machine learning concepts that are vital for data science. (Understanding)
- Develop Python code to statistically Analyse a dataset. (Applying)
- Analyse data visualizations based on their design (Analysing)

Evaluate the use of communicating stories from data (Evaluating)
Design and develop analytical report (Creating)

Module I (5 Hours)

Introduction to core concepts and technologies: Introduction, Terminology, data science process, data science toolkit, Types of data, Example applications.

Module II (7 Hours)

Data collection and management: Introduction, Sources of data, Data collection and APIs, Exploring and fixing data, Data storage and management, Using multiple data sources

Module III (10 Hours)

Data analysis: Introduction, Terminology and concepts, Introduction to statistics, Central tendencies and distributions, Variance, Distribution properties and arithmetic, Samples/CLT, Basic machine learning algorithms, Linear regression, SVM, Naive Bayes.

Module IV (10 Hours)

Data visualisation: Introduction, Types of data visualisation, Data for visualisation: Data types, Data encodings, Retinal variables, Mapping variables to encodings, Visual encodings.

Module V (6 Hours)

Applications of Data Science, Technologies for visualisation, Bokeh (Python)

Module VI (7 Hours)

Recent trends in various data collection and analysis techniques, various visualization techniques, application development methods used in data science.

Suggested Readings

Cathy O'Neil and Rachel Schutt. Doing Data Science, Straight Talk From The Frontline. O'Reilly.
Jure Leskovek, Anand Rajaraman and Jeffrey Ullman. Mining of Massive Datasets. v2.1, Cambridge University Press.

CO 1	M	M				
CO 2	H	M	H			
CO 3			M	H		
CO 4				H	M	
CO 5				M	H	
CO 6					M	H

CSDI0089: DISTRIBUTED SYSTEMS

(3 Credits)

Objectives: To introduce the fundamental concepts and issues of managing a large volume of shared data in a parallel and distributed environment, and to provide insight into related research problems.

Course Outcomes

Recall the fundamental concepts and issues of managing a large volume of shared data in a parallel and distributed environment. (Remembering)

Explain the distributed system architecture and its application in various fields. (Understanding)

Apply network virtualization and analyse pros and cons. (Applying)

Analyse design trends in distributed systems. (Analysing)

Formulate and evaluate remote method invocation and objects. (Evaluating, Creating)

Module I (8 Hours)

Introduction: Distributed data processing; What is a DDBS; Advantages and disadvantages of DDBS; Problem areas; Overview of database and computer network concepts Distributed database management system architecture: Transparencies in a distributed DBMS; Distributed DBMS architecture; Global directory issues

Module II (10 Hours)

Distributed database design: Alternative design strategies; Distributed design issues; Fragmentation; Data allocation Semantics data control:View management; Data security; Semantic Integrity Control Query processing issues: Objectives of query processing; Characterization of query processors; Layers of query processing; Query decomposition; Localization of distributed data.

Module III (10 Hours)

Distributed query optimization: Factors governing query optimization; Centralized query optimization; Ordering of fragment queries; Distributed query optimization algorithms
Transaction management:The transaction concept; Goals of transaction management; Characteristics of transactions; Taxonomy of transactionmodels
Concurrency control: Concurrency control in centralized database systems; Concurrency control in DDBSs; Distributed concurrency control algorithms; Deadlock management

Module IV (7 Hours)

Reliability issues in DDBSs; Types of failures; Reliability techniques; Commit protocols; Recovery protocols

Module V (6 Hours)

Parallel database systems:Parallel architectures; parallel query processing and optimization; load balancing

Module VI (4 Hours)

Advanced topics:Mobile Databases, Distributed Object Management, Multi-databases

Suggested Readings

Principles of Distributed Database Systems, M.T. Ozsú and P. Valduriez, Prentice-Hall, 1991.
Distributed Database Systems, D. Bell and J. Grimson, Addison-Wesley, 1992.

Mapping of COs to Syllabus

	Module I	Module II	Module III	Module IV	Module V	Module VI
CO 1	H	M				
CO 2	H	H	M			
CO 3		M	H	M		
CO 4				H	M	M
CO 5				M	H	

CSDP0090: DATA PREPARATION AND ANALYSIS

(3 Credits)

Objective: To prepare the data for analysis and develop meaningful Data Visualizations

Course Outcomes

List the data gathering and preparation techniques. (Remembering)
Explain the techniques as per utilisation. (Understanding)
Apply explorative analysis techniques. (Applying)
Analyse results after application of explorative analysis techniques. (Analysing)
Evaluate the data visualisation outcomes (Evaluating)
Formulate efficient techniques for data preparation and analysis. (Creating)

Module I (9 Hours)

Data Gathering and Preparation: Data formats, parsing and transformation, Scalability and real- time issues

Module II (10 Hours)

Data Cleaning: Consistency checking, Heterogeneous and missing data, Data Transformation And segmentation

Module III (12 Hours)

Exploratory Analysis: Descriptive and comparative statistics, Clustering and association, Hypothesis generation

Module IV (14 Hours)

Visualization: Designing visualizations, Timeseries, Geolocated data, Correlations and connections, Hierarchies and networks, interactivity

Suggested Readings

Making sense of Data : A practical Guide to Exploratory Data Analysis and Data Mining, by Glenn J. Myatt

Mapping of COs to Syllabus

CSRS0091: RECOMMENDER SYSTEM

(3 Credits)

Objectives:

To learn techniques for making recommendations, including non-personalized, content-based, and collaborative filtering

To automate a variety of choice-making strategies with the goal of providing affordable, personal, and high-quality recommendations

Course Outcomes

Relate techniques for making recommendations, including non-personalized, content-based, and collaborative filtering (Remembering)

Illustrate automation of a variety of choice-making strategies with the goal of providing affordable, personal, and high-quality recommendations. (Understanding)

Apply techniques for making recommendations, including non-personalized, content-based, and collaborative filtering (Applying)

Analyse the choice-making strategies with the goal of providing affordable, personal, and high-quality recommendations. (Analysing)

Evaluate recommender systems on the basis of metrics such as accuracy, rank accuracy, diversity, product coverage, and serendipity. (Evaluating)

Design recommendation system for a particular application domain. (Creating)

Module I (8 Hours)

Introduction: Overview of Information Retrieval, Retrieval Models, Search and Filtering, Techniques: Relevance Feedback, User Profiles, Recommender system functions, Matrix operations, covariance matrices, Understanding ratings, Applications of recommendation systems, Issues with recommender system.

Module II (8 Hours)

Content-based Filtering: High level architecture of content-based systems, Advantages and drawbacks of content based filtering, Item profiles, Discovering features of documents, pre-processing and feature extraction, Obtaining item features from tags, Methods for learning user profiles, Similarity based retrieval, Classification algorithms.

Module III (8 Hours)

Collaborative Filtering: User-based recommendation, Item-based recommendation, Model based approaches, Matrix factorization, Attacks on collaborative recommender systems.

Module IV (8 Hours)

Hybrid approaches: Opportunities for hybridization, Monolithic hybridization design: Feature combination, Feature augmentation, Parallelized hybridization design: Weighted, Switching, Mixed, Pipelined hybridization design: Cascade, Meta-level, Limitations of hybridization strategies

Module V (5 Hours)

Evaluating Recommender System: Introduction, General properties of evaluation research, Evaluation designs: Accuracy, Coverage, confidence, novelty, diversity, scalability, serendipity, Evaluation on historical datasets, Offline evaluations.

Module VI (8 Hours)

Types of Recommender Systems: Recommender systems in personalized web search, knowledge-based recommender system, Social tagging recommender systems, Trust-centric recommendations, Group recommender systems.

Suggested Readings

Jannach D., Zanker M. and Felfering A., Recommender Systems: An Introduction, Cambridge University Press (2011), 1st ed.

Charu C. Aggarwal, Recommender Systems: The Textbook, Springer (2016), 1st ed.

Ricci F., Rokach L., Shapira D., Kantor B. P., Recommender Systems Handbook, Springer (2011), 1st ed.

Manouselis N., Drachsler H., Verbert K., Duval E., Recommender Systems For Learning, Springer (2013), 1st ed.

CSML0092: MACHINE LEARNING

(3 Credits)

Objectives:

To learn the concept of how to learn patterns and concepts from data without being explicitly programmed in various IOT nodes.

To design and analyse various machine learning algorithms and techniques with a modern outlook focusing on recent advances.

Explores supervised and unsupervised learning paradigms of machine learning.

To explore Deep learning techniques and various feature extraction strategies.

Course Outcomes

Relate how to learn patterns and concepts from data without being explicitly programmed in various IOT nodes. (Remembering)

Illustrate supervised and unsupervised learning paradigms of machine learning. (Understanding)

Design and analyse various machine learning algorithms and techniques with a modern outlook focusing on recent advances. (Applying, Analysing)

Examine the Deep learning techniques and various feature extraction strategies. (Analysing)

Evaluate the results and compare in a different environment to have best results. (Evaluating)

Create applications as per the requirements in a suitable environment. (Creating)

Module I (10Hours) Supervised Learning (Regression/Classification)

Basic methods: Distance-based methods, Nearest-Neighbours, Decision Trees, Naive Bayes, Linear models: LinearRegression, LogisticRegression, GeneralizedLinearModels, SupportVectorMachines, Non-linearity and Kernel Methods, Beyond Binary Classification: Multi-class/Structured Outputs, Ranking

Module II (7 Hours) Unsupervised Learning

Clustering: K-means/Kernel K-means, Dimensionality Reduction: PCA and kernel PCA, Matrix Factorization and Matrix Completion, Generative Models (mixture models and latent factor models)

Module III (6 Hours)

Evaluating Machine Learning algorithms and Model Selection, Introduction to Statistical, Learning Theory, Ensemble Methods (Boosting, Bagging, RandomForests)

Module IV (8 Hours)

Sparse Modeling and Estimation, Modeling Sequence/Time-Series Data, DeepLearning and Feature Representation Learning

Module V (8 Hours)

Scalable Machine Learning (Online and Distributed Learning) A selection from some other advanced topics, e.g., Semi-supervised Learning, Active Learning, Reinforcement Learning, Inference in Graphical Models, Introduction to Bayesian Learning and Inference

Module VI (6 Hours)

Recent trends in various learning techniques of machine learning and classification methods for IOT applications. Various models for IOT applications.

Suggested Readings

Kevin Murphy, Machine Learning: A Probabilistic Perspective, MIT Press, 2012

TrevorHastie, RobertTibshirani, JeromeFriedman, TheElementsofStatisticalLearning, Springer 2009 (freely available online)

Christopher Bishop, Pattern Recognition and Machine Learning, Springer, 2007.

CSTN0093: DATA STORAGE TECHNOLOGIES AND NETWORKS

(3 Credits)

Objective: To provide learners with a basic understanding of Enterprise Data Storage and Management Technologies

Course Outcomes

Recall the various data storage techniques (Remembering)

Explain the basic understanding of Enterprise Data Storage and Management Technologies (Understanding)

Experiment with Storage System Architecture (Applying)

Analyse the Virtualization Technologies and Storage Area Network (Analysing)

Evaluate and deploy an efficient technique for data storage. (Evaluating & Creating)

Module I (7 Hours)

Storage Media and Technologies – Magnetic, Optical and Semiconductor Media, Techniques for read/write Operations, Issues and Limitations.

Module II (8Hours)

Usage and Access – Positioning in the Memory Hierarchy, Hardware and Software, Design for Access, Performance issues.

Module III (7 Hours)

Large Storages – Hard Disks, Networked Attached Storage, Scalability issues, networking issues.

Module IV (8 Hours)

Storage Architecture- Storage Partitioning, Storage System Design, Caching, Legacy Systems.

Module V (10 Hours)

Storage Area Networks – Hardware and Software Components, Storage Clusters/Grids. Storage QoS– Performance, Reliability, and Security issues.

Module VI (5 Hours)

Recent Trends related to Copy data management, Erasure coding, and Software Defined Storage appliances.

Suggested Readings

CSAA0103: ADVANCED ALGORITHMS

(3 Credits)

Objectives:

Introduce students to the advanced methods of designing and Analysing algorithms. The student should be able to choose appropriate algorithms and use it for a specific problem.

To familiarize students with basic paradigms and data structures used to solve advanced algorithmic problems.

Students should be able to understand different classes of problems concerning their computation difficulties.

To introduce the students to recent developments in the area of algorithmic design.

Course Outcomes

Recall different algorithms (Remembering)

Explain the applications of various algorithms (Understanding)

Applying computer algorithms for different purposes. (Applying)

Analyse the complexity/ performance of different algorithms. Categorize the different problems in various classes according to their complexity. (Analysing)

Evaluate the different problems in various classes according to their complexity. (Evaluation)

Elaborate the recent activities in the field of the advanced data structure. (Creating)

Module I (6 Hours)

Sorting: Review of various sorting algorithms, topological sorting

Graph: Definitions and Elementary Algorithms: Shortest path by BFS, shortest path in edge weighted case (Dijkstra's), depth-first search and computation of strongly connected components, emphasis on correctness proof of the algorithm and time/space analysis, example of amortized analysis.

Module II (7 Hours)

Matroids: Introduction to greedy paradigm, algorithm to compute a maximum weight maximal independent set. Application to MST.

Graph Matching: Algorithm to compute maximum matching. Characterization of maximum matching by augmenting paths, Edmond's Blossom algorithm to compute augmenting paths.

Module III (8 Hours)

Flow-Networks: Maxflow-mincut theorem, Ford-Fulkerson Method to compute, maximum flow, Edmond-Karp maximum-flow algorithm.

Matrix Computations: Strassen's algorithm and introduction to divide and conquer paradigm, inverse of a triangular matrix, relation between the time complexities of basic matrix operations, LUP-decomposition.

Module IV (9 Hours)

Shortest Path in Graphs: Floyd-Warshall algorithm and introduction to dynamic programming paradigm. More examples of dynamic programming.

Modulo Representation of integers/polynomials: Chinese Remainder Theorem, Conversion between base-representation and modulo-representation. Extension to polynomials. Application: Interpolation problem.

Discrete Fourier Transform (DFT): In complex field, DFT in modulo ring. Fast Fourier Transform algorithm. Schonhage-Strassen Integer Multiplication algorithm

Module V (10 Hours)

Linear Programming: Geometry of the feasibility region and Simplex algorithm NP-completeness: Examples, proof of NP-hardness and NP-completeness.

One or more of the following topics based on time and interest Approximation algorithms, Randomized Algorithms, Interior Point Method, Advanced Number Theoretic Algorithm

Module VI (5 Hours)

Recent Trends in problem solving paradigms using recent searching and sorting techniques by applying recently proposed data structures.

Suggested Readings

"Introduction to Algorithms" by Cormen, Leiserson, Rivest, Stein.

"The Design and Analysis of Computer Algorithms" by Aho, Hopcroft, Ullman.

"Algorithm Design" by Kleinberg and Tardos.

CSSP0104: SOFT COMPUTING

(3 Credits)

Objectives:

To introduce soft computing concepts and techniques and foster their abilities in designing appropriate techniques for a given scenario.

To implement soft computing based solutions for real-world problems.

To give students knowledge of non-traditional technologies and fundamentals of artificial neural

networks, fuzzy sets, fuzzy logic, geneticalgorithms.

To provide student hand-on experience on MATLAB to implement variousstrategies.

Course Outcomes

Identify and describe soft computing techniques and their roles in building intelligent machines. (Remembering & understanding)

Apply fuzzy logic and reasoning to handle uncertainty and solve various engineering problems. (Applying)

Analyse genetic algorithms to combinatorial optimization problems. (Analysing)

Evaluate and discuss solutions by various soft computing approaches for a given problem. (Evaluating and Creating).

Module I (7 Hours)

Introduction to soft computing and neural networks: Evolution of Computing: Soft Computing Constituents, FromConventional AI to Computational Intelligence: Machine Learning Basics

Module II (8 Hours)

Fuzzy logic: Fuzzy Sets, Operations on Fuzzy Sets, Fuzzy Relations,Membership Functions: Fuzzy Rules and Fuzzy Reasoning, Fuzzy InferenceSystems, Fuzzy Expert Systems, Fuzzy Decision Making.

Module III (8 Hours)

Neural networks: Machine Learning Using Neural Network, AdaptiveNetworks, Feed forward Networks, Supervised Learning Neural Networks,Radial Basis Function Networks : Reinforcement Learning, Un-supervisedLearning Neural Networks, Adaptive Resonance architectures, Advances inNeural networks

Module IV (5 Hours)

Genetic algorithms: Introduction to Genetic Algorithms (GA),Applications of GA in Machine Learning : Machine Learning Approach toKnowledge Acquisition.

Module V (12 Hours)

Matlab/Python Lib: Introduction to Matlab/Python, Arrays and array operations, Functions and Files, Study of neural network toolbox and fuzzy logic toolbox, Simple implementation of Artificial Neural Network and Fuzzy Logic

Module VI (5 Hours)

Recent Trends in deep learning, various classifiers, neural networks and genetic algorithms. Implementation of recently proposed soft computing techniques.

Suggested Readings

CSDV0105: DATA VISUALISATION

(3 Credits)

Objectives:

To familiarize students with the basic and advanced techniques of information visualization and scientific visualization,

To learn key techniques of the visualization process, a detailed view of visual perception, the visualized data and the actual visualization interaction and distorting techniques

Course Outcomes

- Recall the basic and advanced techniques of information and scientific visualization. (Remembering)
- Explain the key techniques of the visualization process. (Understanding)
- Apply detailed view of visual perception, the visualized data and the actual visualization, interaction and distorting techniques. (Applying)
- Analyse different visualization techniques and their applicability to different types of data. (Analysing)
- Compare techniques for visual mapping, geographic data and collaborative visualization. (Evaluating)
- Create a process to have an understanding of large-scale abstract data. (Creating)

Module I (8 Hours)

Introduction of visual perception, visual representation of data, Gestalt principles, information overloads.

Module II (8 Hours)

Creating visual representations, visualization reference model, visual mapping, visual analytics, Design of visualization applications.

Module III (8 Hours)

Classification of visualization systems, Interaction and visualization techniques misleading, Visualization of one, two and multi-dimensional data, text and text documents.

Module IV (10 Hours)

Visualization of groups, trees, graphs, clusters, networks, software, Metaphorical visualization

Module V (7 Hours)

Visualization of volumetric data, vector fields, processes and simulations, Visualization of maps, geographic information, GIS systems, collaborative visualizations, Evaluating visualizations

Module VI (4 Hours)

Recent trends in various perception techniques, various visualization techniques, data structures used in data visualization.

Suggested Readings

CSBD0106: BIG DATA ANALYTICS

(3 Credits)

Objectives:

- Understand big data for business intelligence. Learn business case studies for big data analytics.
- Understand nosql big data management. Perform map-reduce analytics using Hadoop and related tools

Course Outcomes

- Describe big data and use cases from selected business domains. (Remembering & Understanding)
- Applying NoSQL big data management. (Applying)
- Install, configure, and run Hadoop and HDFS and analyse the data. (Analysing)
- Perform map-reduce analytics using Hadoop (Evaluating)

Use Hadoop related tools such as HBase, Cassandra, Pig, and Hive for creating big data analytics.
(Creating)

Module I (8 Hours)

What is big data, why big data, convergence of key trends, unstructured data, industry examples of big data, web analytics, big data and marketing, fraud and big data, risk and big data, credit risk management, big data and algorithmic trading, big data and healthcare, big data in medicine, advertising and big data, big data technologies, introduction to Hadoop, open source technologies, cloud and big data, mobile business intelligence, Crowd sourcing analytics, inter and trans firewall analytics.

Module II (8 Hours)

Introduction to NoSQL, aggregated data models, aggregates, key-value and document data models, relationships, graph databases, schemaless databases, materialized views, distribution models, sharding, master-slave replication, peer-to-peer replication, sharding and replication, consistency, relaxing consistency, version stamps, map-reduce, partitioning and combining, composing map-reduce calculations.

Module III (8 Hours)

Data format, Analysing data with Hadoop, scaling out, Hadoop streaming, Hadoop pipes, design of Hadoop distributed file system (HDFS), HDFS concepts, Java Interface, data flow, Hadoop I/O, data integrity, compression, serialization, Avro, file-based data structures

Module IV (8 Hours)

MapReduce workflows, unit tests with MRUnit, test data and local tests, anatomy of MapReduce job run, classic Map-reduce, YARN, failures in classic Map-reduce and YARN, job scheduling, shuffle and sort, task execution, MapReduce types, input formats, output formats

Module V (7 Hours)

Hbase, data model and implementations, Hbase clients, Hbase examples, praxis. Cassandra, Cassandra data model, Cassandra examples, Cassandra clients, Hadoop integration.

Module VI (6 Hours)

Pig, Grunt, pig data model, Pig Latin, developing and testing Pig Latin scripts. Hive, data types and file formats, HiveQL data definition, HiveQL data manipulation, HiveQL queries.

CSDD0107: DATA WAREHOUSING AND DATA MINING

(3 Credits)

Objectives:

The objective of this course is to introduce data warehousing and mining techniques.

Application of data mining in web mining, pattern matching and cluster analysis is included to aware students of broad data mining areas.

Course Outcomes

List the various data warehousing and data mining techniques. (Remembering)

Explain the principles, concepts, functions and various applications of data warehouse. (Understanding)

Apply data mining techniques for classification and prediction. (Applying)

Perform cluster, periodicity and social network analysis. (Analysing)

Evaluate and compare various data mining solutions for a given problem. (Evaluating)

Choose appropriate data warehousing and data mining techniques to build real-world systems. (Creating)

Module I (7 Hours)

Introduction to Data Warehousing; Data Mining: Mining frequent patterns, association and correlations; Sequential Pattern Mining concepts, primitives, scalable methods;

Module II (7 Hours)

Classification and prediction; Cluster Analysis – Types of Data in Cluster Analysis, Partitioning methods, Hierarchical Methods; Transactional Patterns and other temporal based frequent patterns,

Module III (8 Hours)

Mining Time series Data, Periodicity Analysis for time related sequence data, Trend analysis, Similarity search in Time-series analysis;

Module IV (9 Hours)

Mining Data Streams, Methodologies for stream data processing and stream data systems, Frequent pattern mining in stream data, Sequential Pattern Mining in Data Streams, Classification of dynamic data streams, Class Imbalance Problem; Graph Mining; Social Network Analysis;

Module V (9 Hours)

Web Mining, Mining the web page layout structure, mining web link structure, mining multimedia data on the web, Automatic classification of web documents and web usage mining; Distributed Data Mining.

Module VI (5 Hours)

Recent trends in Distributed Warehousing and Data Mining, Class Imbalance Problem; Graph Mining; Social Network Analysis

Suggested Readings

CSDS0108: DATA SECURITY AND ACCESS CONTROL**(3 Credits)**

Objective: The objective of the course is to provide fundamentals of database security. Various access control techniques mechanisms were introduced along with application areas of access control techniques.

Course Outcomes

Define access control in the database. (Remembering)

Explain the purpose and fundamentals of access control. (Understanding)

Identify the capabilities and limitations of various access control mechanisms. (Applying)

Analyse the data, identify the problems, and choose the relevant models and algorithms to apply. (Analysing)

Assess the strengths and weaknesses of various access control models and to Analyse their behaviour. (Evaluating)

Design and develop access control mechanisms for enterprise IT infrastructures. (Creating)

Module I (7 Hours)

Introduction to Access Control, Purpose and fundamentals of access control, brief history, Policies of Access Control, Models of Access Control, and Mechanisms, Discretionary Access Control (DAC), Non-Discretionary Access Control, Mandatory Access Control (MAC). Capabilities and Limitations of Access Control Mechanisms: Access Control List (ACL) and Limitations, Capability List and Limitations.

Module II (8 Hours)

Role-Based Access Control (RBAC) and Limitations, Core RBAC, Hierarchical RBAC, Statically Constrained RBAC, Dynamically Constrained RBAC, Limitations of RBAC. Comparing RBAC to DAC and MAC Access control policy.

Module III (9 Hours)

Biba Integrity model, Clark-Wilson model, Domain type enforcement model, mapping the enterprise view to the system view, Role hierarchies- inheritance schemes, hierarchy structures and inheritance forms, using SoD in real system Temporal Constraints in RBAC, MAC AND DAC. Integrating RBAC with enterprise IT infrastructures: RBAC for WFMSs, RBAC for UNIX and JAVA environments Case study: Multi line Insurance Company

Module IV (10 Hours)

Smart Card based Information Security, Smart card operating system fundamentals, design and implantation principles, memory organization, smart card files, file management, atomic operation, smart card data transmission ATR, PPS Security techniques- user identification, smart card security, quality assurance and testing, smart card life cycle-5 phases, smart card terminals.

Module V (7 Hours)

Recent trends in Database security and access control mechanisms. Case study of Role-Based Access Control (RBAC) systems.

Module VI (4 Hours)

Recent Trends related to data security management, vulnerabilities in different DBMS.

Suggested Readings

Role Based Access Control: David F. Ferraiolo, D. Richard Kuhn, Ramaswamy Chandramouli.

CSWD0109: WEB ANALYTICS AND DEVELOPMENT
(3 Credits)

Objective: The course explores use of social network analysis to understand growing connectivity and complexity in the world ranging from small groups to WWW.

Course Outcomes

Relate with core research communities, publications, focused on web and social media analytics and research questions engaged. (Remembering)
Discuss clickstream data collection techniques, their impact on metrics, and their inherent limitations. (Understanding)
Identify and interpret commonly used web metrics (Applying)
Analyse and evaluate tasks and techniques used in web analytics. (Analysis/Evaluation)
Elaborate the resulting insights to support website design decisions, campaign optimisation, search analytics, etc. (Creating)

Module I (8 Hours)

Introduction – Social network and Web data and methods, Graph and Matrices, Basic measures for individuals and networks, Information Visualization

Module II (8 Hours)

Web Analytics tools: Click Stream Analysis, A/B testing, Online Surveys

Module III (8 Hours)

Web Search and Retrieval: Search Engine Optimization, Web Crawling and indexing, Ranking Algorithms, Web traffic models

Module IV (12 Hours)

Making Connection: Link Analysis, Random Graphs and Network evolution, Social Connects: Affiliation and identity

Module V (9 Hours)

Connection: Connection Search, Collapse, Robustness Social involvements and diffusion of innovation

Suggested Readings

CSKD0110: KNOWLEDGE DISCOVERY
(3 Credits)

Objective: To conduct case studies on real data mining examples

Course Outcomes

Recall the basic terminologies like learning goals, concept representation, decision tree, computational learning, artificial neural network, classification. (Remembering)

Explain different categories of machine learning and machine learning methodologies and illustrate the theory behind designing a learning model. (Understanding)

Compare efficiency of different learning algorithms, classify supervised and unsupervised learning goals. (Understanding)

Apply different learning algorithms for real life classification problem, sketch the structure of different learning model such as neural network, support vector machine, naive bayes etc. (Applying)

Analyse decision tree learning, computational learning, artificial neural network and instance based learning and how one learning overcomes the drawback in the other. (Analysing)

Judge in terms of different complexity which algorithms better in what situation. (Evaluating).

Create and design ensemble based learning, propose new learning for optimizing real life problems. (Creating)

Module I (7 Hours)

Introduction KDD and Data Mining - Data Mining and Machine Learning, Machine Learning and Statistics, Generalization as Search, Data Mining and Ethics

Module II (8 Hours)

Knowledge Representation - Decision Tables, Decision Trees, Classification Rules, Association Rules, Rules involving Relations, Trees for Numeric Predictions, Neural Networks, Clusters

Module III (9 Hours)

Decision Trees - Divide and Conquer, Calculating Information, Entropy, Pruning, Estimating Error Rates, The C4.5 Algorithm Evaluation of Learned Results- Training and Testing, Predicting Performance, Cross-Validation

Module IV (8 Hours)

Classification Rules - Inferring Rudimentary Rules, Covering Algorithms for Rule Construction, Probability Measure for Rule Evaluation, Association Rules, Item Sets, Rule Efficiency

Module V (6 Hours)

Numeric Predictions - Linear Models for Classification and Numeric Predictions, Numeric Predictions with Regression Trees, Evaluating Numeric Predictions

Module VI (7 Hours)

Artificial Neural Networks – Perceptrons, Multilayer Networks, The Backpropagation Algorithm Clustering - Iterative Distance-based Clustering, Incremental Clustering, The EM Algorithm

CSNL0111: NATURAL LANGUAGE PROCESSING

(3 Credits)

Objectives: The goals for this course are to study:

algorithms and methods for building computational models of natural language understanding, including syntactic analysis, semantic representations, discourse analysis, and statistical and corpus-based methods for text processing and knowledge acquisition

issues involved in natural language understanding applications that can benefit from natural language processing, such as information extraction, question answering, machine translation, and spoken language understanding. By the end of the course, students will have a good understanding of and appreciation for natural language processing, and have the necessary skills to build natural language processing tools.

Course Outcomes

Recall algorithms and methods for building computational models of natural language processing (Remembering)

Explain syntactic analysis, semantic representations, discourse analysis, and statistical and corpus-based methods for text processing and knowledge acquisition. (Understanding)

Apply the methods of natural language processing. (Applying)

Analyse Issues involved in natural language processing. (Analysing)

Evaluate and generate applications that can benefit from natural language processing, such as information extraction, question answering, machine translation, and spoken language understanding.

(Evaluating & Creating)

Module I (10 hours)

Introduction to NLP, Knowledge in language processing, Representation and Understanding, Organization of NLP systems, Models and algorithms, Linguistic Essentials

Module II (15 hours)

Grammars and Parsing - Syntactic Processing: Collocations; Regular Expression and Automata; Morphology and Finite-State Transducers; N-grams; Word Classes and Part-of-Speech Tagging; Context-Free Grammars for English; Parsing with Context-Free Grammars: Top-down parsing, Bottom-up parsing; Features and Unification; Lexicalized and Probabilistic Parsing

Module III (10 hours)

Semantic processing :Representing Meaning; Semantic Analysis: Integrating semantic analysis to parsers, Semantic Grammars; Lexical Semantics; Word Sense Disambiguation and Information Retrieval: Selection- Restriction based disambiguation, Machine learning approaches; Dictionary based approaches, Information retrieval

Module IV (7 hours)

Pragmatics :Discourse, Dialogue and Conversational Agents: Dialogue acts, Automatic Interpretation of Dialogue acts; Natural Language Generation: Discourse Planning; Machine Translation: Direct Translations, Translation using Statistical techniques

Module V (3 hours)

NLP Applications and Tools :Sentiment Analysis, Text Summarization, Text Entailment, Machine Translation, Question Answering, Cross Lingual Information Retrieval (CLIR), NLTK, WordNet

CSAA6078: ADVANCED ALGORITHM LAB

(2 Credits)

Objectives:

The fundamental design, analysis, and implementation of basic data structures.

Basic concepts in the specification and analysis of programs.

Principles for good program design, especially the uses of data abstraction.

Sample Problems on Data structures

Course Outcomes

Recall and explain the fundamentals of design and analysis of basic data structures and experiment with the implementation process. (Remembering, Understanding, Applying)

Examine and evaluate the concepts in the specification and analysis of programs. (Analysing, Evaluating)

Elaborate the principles for good program design, especially the uses of data abstraction. (Creating)

List of Programs

Program to find Breadth First Search of a graph.

Program to find Depth First Search of a graph.

Program to find strongly connected components of a graph.

Implement Prim's algorithm to find a minimal spanning tree of a graph.

Implement Kruskal's algorithm to find a minimal spanning tree of a graph.

Implement Dijkstra's algorithm to find the shortest path in a graph.

Implementation of algorithms to compute a maximum weight maximal independent set.

Implementation of graph matching algorithms.

Implementation of Ford-Fulkerson Method to compute maximum flow.

Implementation of Edmond-Karp maximum-flow algorithm.

Implement Strassen's Algorithm.

Implement Floyd Warshall Algorithm.

CSDV6079: DATA VISUALISATION LAB

(2 Credits)

Course Outcomes

Recall the design process to develop visualization methods and visualization systems, and methods for their evaluation. (Remembering)

Create and process data and visual mapping and the visualization (Creating).

Illustrate an understanding of large-scale abstract data. (Understanding)

Analyse data in various perspectives. (Analysing)

Evaluate the results generated from various applications. (Evaluating)

Create visualization methods for different applications. (Creating)

List of Programs

Program to recursively subdivide a tetrahedron to form a 3D Sierpinski gasket. The number of recursive steps is to be specified by the user.

Program to implement Liang-Barsky line clipping algorithm.

Program to draw a color cube and spin it using OpenGL transformation matrices.

Program to create a house-like figure and rotate it about a given fixed point using OpenGL functions.

Program to implement the Cohen-Sutherland line-clipping algorithm. Make provision to specify the input line, window for clipping and view port for displaying the clipped image.

Program to create a cylinder and a parallelepiped by extruding a circle and quadrilateral respectively.

Allow the user to specify the circle and the quadrilateral.

Program, using OpenGL functions, to draw a simple shaded scene consisting of a teapot on a table.

Define suitably the position and properties of the light source along with the properties of the surfaces of the solid object used in the scene.

Program to draw a color cube and allow the user to move the camera suitably to experiment with perspective viewing. Use OpenGL functions.

Program to fill any given polygon using scan-line area filling algorithm. (Use appropriate data structures.)

Program to display a set of values {fij} as a rectangular mesh. Project: 11. Develop a suitable Graphics package to implement the skills learnt in the theory and the exercises indicated in Part A. Use the OpenGL..

Program to recursively subdivide a tetrahedron to form 3D Sierpinski gasket. The number of recursive steps is to be specified by the user.

Program to implement Liang-Barsky line clipping algorithm.

Program to draw a color cube and spin it using OpenGL transformation matrices.

Program to create a house-like figure and rotate it about a given fixed point using OpenGL functions.

Program to implement the Cohen-Sutherland line-clipping algorithm. Make provision to specify the input line, window for clipping and view port for displaying the clipped image.

Program to create a cylinder and a parallelepiped by extruding a circle and quadrilateral respectively. Allow the user to specify the circle and the quadrilateral.

Program, using OpenGL functions, to draw a simple shaded scene consisting of a tea pot on a table. Define suitably the position and properties of the light source along with the properties of the surfaces of the solid object used in the scene.

Program to draw a color cube and allow the user to move the camera suitably to experiment with perspective viewing. Use OpenGL functions.

Program to fill any given polygon using scan-line area filling algorithm. (Use appropriate data structures.)

Program to display a set of values {fij} as a rectangular mesh.

Project: 1. Develop a suitable Graphics package to implement the skills learnt in the theory and the exercises indicated in Part A. Use the OpenGL.

CSMI6081: MINI PROJECT WITH SEMINAR

(2 Credits)

Course Outcomes

Recall the software development life cycle and fundamental phases of system/application/software design and research. (Remembering)

Explain how to carry out a project work and explain the importance of different phase of a system design, workflow and time estimation with research outlook. (Understanding)

Implement a system and plan how to perform research for real time application along with hardware and softwares. (Applying)

Compare the feasibility of a project in terms of time, effort and money. (Analyze)

Evaluate a project based on its efficiency applicability robustness, user friendliness etc., with socio economic factors (Evaluating)

Design applications by critically examining and scientifically designing each phase of the project. (Creating)

CSCG0134: GPU COMPUTING

(3 Credits)

Objectives: The objective of the course is to learn concepts of parallel programming, learn parallel programming with Graphics Processing Units (GPUs), implement programs on GPUs, and learn debugging and profiling of programs written for GPUs.

Course Outcomes

Describe the basic concepts of GPUs and parallel programming (Remembering)

Explain the hardware and software aspects of GPU (Understanding)

Use GPU for applications such as Image Processing, Graph algorithms, Simulations and Deep Learning. (Applying)

Analyze GPU programs to detect errors (Analyzing)

Evaluate the efficiency of GPU programs (Evaluating)

Develop GPU programs including programs for concurrent data structures and programs employing different synchronization techniques (Creating)

Module I (12 Hours)

Introduction: History, Graphics Processors, Graphics Processing Units, GPGPUs. Clock speeds,

CPU/GPU comparisons, Heterogeneity, Accelerators, Parallel programming, CUDA OpenCL/Open-ACC, Hello World ComputationKernels,Launchparameters,Threadhierarchy,Warps/Wavefronts,Thread-blocks/Workgroups, Streaming multiprocessors, 1D/2D/3D thread mapping, Device properties, Simple-Programs

Module II (7 Hours)

Memory:Memoryhierarchy,DRAM/global,local/shared,private/local,textures,ConstantMemory,Pointers, Parameter Passing, Arrays and dynamic Memory, Multi-dimensional Arrays, Memory Allocation, Memory copying across devices, Programs with matrices, Performance evaluation with differentmemo-ries

Module III (9 Hours)

Synchronization: Memory Consistency, Barriers (local versus global), Atomics, Memory fence. Prefix sum, Reduction. Programs for concurrent Data Structures such as Worklists, Linked-lists. Synchroniza-tion across CPU and GPU

Functions:Devicefunctions,Hostfunctions,Kernelsfunctions,Usinglibraries(suchasThrust),anddeveloping libraries.

Module IV (7 Hours)

Support: Debugging GPU Programs. Profiling, Profile tools, Performance aspects

Streams: Asynchronous processing, tasks, Task-dependence, Overlapped data transfers, Default Stream, Synchronization with streams. Events, Event-based-Synchronization - Overlapping data trans-fer and kernel execution, pitfalls.

Module V (5 Hours)

Case Studies: Image Processing, Graph algorithms, Simulations, Deep Learning

Module VI (5 Hours)

Advanced topics: Dynamic parallelism, Unified Virtual Memory, Multi-GPU processing, Peer access, Het-erogeneous processing.

Suggested Readings

CSCL0135: CLOUD COMPUTING

(3 Credits)

Objectives:

The student will also learn how to apply trust-based security model to real-world security problems.

An overview of the concepts,processes,and bes tpractices needed to successfully secure information

within Cloud infrastructures.

Students will learn the basic Cloud types and delivery models and develop an understanding of the risk and compliance responsibilities and Challenges for each Cloud type and service delivery model.

Course Outcomes

- Basics of cloud computing (Remembering)
- Understanding cloud computing architecture and cloud computing model (Understanding)
- Identify security aspects of each cloud model (Applying)
- Develop a risk management strategy for moving to the cloud (Analysing)
- Implement a public cloud instance using a public cloud service provider (Evaluating)
- Apply trust based security model to different layer (Creating)

Module I (8 Hours)

Introduction to Cloud Computing

Online Social Networks and Applications, Cloud introduction and overview, Different clouds, Risks, Novel applications of cloud computing.

Module II (8 Hours)

Cloud Computing Architecture Requirements, Introduction Cloud computing architecture, On Demand Computing Virtualization at the infrastructure level, Security in Cloud computing environments, CPU Virtualization, A discussion on Hypervisors Storage Virtualization Cloud Computing Defined, The SPI Framework for Cloud Computing, The Traditional Software Model, The Cloud Services Delivery Model

Cloud Deployment Models Key Drivers to Adopting the Cloud, The Impact of Cloud Computing on Users, Governance in the Cloud, Barriers to Cloud Computing Adoption in the Enterprise

Module III (8 hours)

Security Issues in Cloud Computing, Infrastructure Security, Infrastructure Security: The Network Level, The Host Level, The Application Level, Data Security and Storage, Aspects of Data Security, Data Security Mitigation Provider Data and Its Security

Identity and Access Management, Trust Boundaries and IAM, IAM Challenges, Relevant IAM Standards and Protocols for Cloud Services, IAM Practices in the Cloud, Cloud Authorization Management

Module IV (8 hours)

Security Management in the Cloud: Security Management Standards, Security Management in the Cloud, Availability Management: SaaS, PaaS, IaaS

Privacy Issues: Privacy Issues, Data Life Cycle, Key Privacy Concerns in the Cloud, Protecting Privacy, Change to Privacy Risk Management and Compliance in Relation to Cloud Computing, Legal and Regulatory Implications,

U.S. Laws and Regulations, International Laws and Regulations.

Module V (8 hours)

Audit and Compliance: Internal Policy Compliance, Governance, Risk, and Compliance (GRC), Regulatory/ External Compliance, Cloud Security Alliance, Auditing the Cloud for Compliance, Security-as-a-Cloud

Module VI (5 hours)

ADVANCED TOPICS: Recent developments in hybrid cloud and cloud security

Suggested Readings

Cloud Computing Explained: Implementation Handbook for Enterprises, John Rhoton, Publication Date: November 2, 2009

Cloud Security and Privacy: An Enterprise Perspective on Risks and Compliance (Theory in Practice), Tim Mather, ISBN-10: 0596802765, O'Reilly Media, September 2009

CSDD0136: DISTRIBUTED DATABASES**(3 Credits)**

Objectives: The objective of course is to provide insight to distributed data base, normalization techniques and integrity rules, and to learn about parallel database systems along with object oriented models.

Course Outcomes

Describe the concepts related to distributed database, normalization techniques and integrity rules, parallel database systems, and distributed object database management systems. (Remembering)
 Explain concepts related to distributed DBMS architecture, query processing, transaction management, distributed concurrency control, distributed object database management systems etc. (Understanding)
 Apply normalization to make efficient retrieval from database and query. (Applying)
 Analyze design issues and efficiency of query statements. (Analyzing)
 Choose appropriate distributed database design for a given application. (Evaluating)
 Create distributed databases, parallel database systems, and object database systems for a given problem. (Creating)

Module I (10 Hours)

Introduction: Distributed Data processing, Distributed database system (DDBMS), Promises of DDBMSs, Complicating factors and Problem areas in DDBMSs, Overview Of Relational DBMS Relational Database concepts, Normalization, Integrity rules, Relational Data Languages, Relational DBMS.

Module II (7 Hours)

Distributed DBMS Architecture: DBMS Standardization, Architectural models for Distributed DBMS, Distributed DBMS Architecture. Distributed Database Design: Alternative design Strategies, Distribution design issues, Fragmentation, Allocation. Semantic Data Control: View Management, Data security, Semantic Integrity Control.

Module III (8 Hours)

Overview of Query Processing: Query processing problem, Objectives of Query Processing, Complexity of Relational Algebra operations, characterization of Query processors, Layers of Query Processing.
 Introduction to Transaction Management: Definition of Transaction, Properties of transaction, types of transaction. Distributed Concurrency Control: Serializability theory, Taxonomy of concurrency control mechanisms, locking based concurrency control algorithms.

Module IV (7 Hours)

Parallel Database Systems: Database servers, Parallel architecture, Parallel DBMS techniques, Parallel execution problems, Parallel execution for hierarchical architecture.

Module V (8 Hours)

Distributed Object Database Management systems: Fundamental Object concepts and Object models, Object distribution design. Architectural issues, Object management, Distributed object storage, Object query processing. Transaction management. Database Interoperability: Database Integration, Query processing.

Module VI (5 Hours)

Recent approaches, models and current trends in improving the performance of Distributed Database.

Suggested Readings

Principles of Distributed Database Systems, Second Edition, M. Tamer Ozsu Patrick Valduriez
 Distributed Databases principles and systems, Stefano Ceri, Giuseppe Pelagatti, Tata McGrawHill.

CSSC0088: DATA SCIENCE**(3 credits)**

Objectives:

*Provide you with the knowledge and expertise to become a proficient data scientist.**Demonstrate an understanding of statistics and machine learning concepts that are vital for data science**Produce Python code to statistically analyse a dataset**Critically evaluate data visualisations based on their design and use for communicating stories from data***Course Outcomes**

Define the basics of the knowledge and expertise required to become a proficient data scientist.

(Remembering)

Demonstrate an understanding of statistics and machine learning concepts that are vital for data science. (Understanding)

Develop Python code to statistically Analyse a dataset. (Applying)

Analyse data visualizations based on their design (Analysing)

Evaluate the use of communicating stories from data (Evaluating)

Design and develop analytical report (Creating)

Module I (5 Hours)

Introduction to core concepts and technologies: Introduction, Terminology, data science process, data science toolkit, Types of data, Example applications.

Module II (7 Hours)

Data collection and management: Introduction, Sources of data, Data collection and APIs, Exploring and fixing data, Data storage and management, Using multiple data sources

Module III (10 Hours)

Data analysis: Introduction, Terminology and concepts, Introduction to statistics, Central tendencies and distributions, Variance, Distribution properties and arithmetic, Samples/CLT, Basic machine learning algorithms, Linear regression, SVM, Naive Bayes.

Module IV (10 Hours)

Data visualisation: Introduction, Types of data visualisation, Data for visualisation: Data types, Data encodings, Retinal variables, Mapping variables to encodings, Visual encodings.

Module V (6 Hours)

Applications of Data Science, Technologies for visualisation, Bokeh (Python)

Module VI (7 Hours)

Recent trends in various data collection and analysis techniques, various visualization techniques, application development methods used in data science.

Suggested Readings

Cathy O'Neil and Rachel Schutt. Doing Data Science, Straight Talk From The Frontline. O'Reilly.

Jure Leskovek, Anand Rajaraman and Jeffrey Ullman. Mining of Massive Datasets. v2.1,

Cambridge University Press.

CSWA0094: WIRELESS ACCESS TECHNOLOGIES**(3 credits)****Objectives:**

Overview of wireless access technologies, Fixed wireless access networks. Terminal mobility issues regarding wireless access to Internet

Introduction to various Network topologies, hotspot networks, Communication links: point-to-point, point-to-multipoint, multipoint-to-multipoint.

To provide an overview of Standards for most frequently used wireless access networks: WPAN, UWB, WLAN, WMAN, WWAN. Network services. Wireless access networks planning, design and installation.

To get an insight of Wireless networking security issues, Wireless access network exploitation and management, software requirements, link quality control.

Course Outcomes

Recall basics of wireless access technologies, Fixed wireless access networks and terminal mobility issues regarding wireless access to the Internet (Remembering)

Explain the various Network topologies, hotspot networks and Communication links. (Understanding)

Explain the standards for most frequently used wireless access networks. (Understanding)

Planning, design and installation of Wireless access networks (Applying)

Analyse and get an insight of Wireless networking security issues, Wireless access network exploitation and management, software requirements and link quality control. (Analysing)

Estimate the requirements of accessories to establish a network (Evaluating)

Establish a network as per requirements. (Creating)

Module I (7 Hours)

Necessity for wireless terminals connectivity and networking. Wireless networking advantages and disadvantages, Overview of wireless access technologies. Narrowband and broadband networks, fixed and nomadic networks. Wireless local loop (WLL), Public Switched Telephone Network (PSTN) interfaces.

Module II (7 Hours)

Fixed wireless access (FWA) networks, frequency bands for different networks. Criteria for frequency bands allocation, Network topologies, hotspot networks. Communication links: point-to-point (PTP), point to multipoint (PMP), multipoint-to-multipoint (MTM).

Module III (9 Hours)

Standards for most frequently used wireless access networks: WPAN (802.15, Bluetooth, DECT, IrDA), UWB (Ultra-Wideband), WLAN (802.11, Wi-Fi, HIPERLAN, IrDA), WMAN (802.16, WiMAX, HIPERMAN, HIPERACCESS),

WWAN (802.20), Other technologies for broadband wireless access, Local Multipoint Distribution Service (LMDS), Multichannel Multipoint Distribution Service (MMDS). Ad Hoc networks, Network services. Services types based on carrier frequency and bandwidth.

Module IV (9 Hours)

Wireless access networks planning, design and installation. Services provision, legislative and technical aspects, Technical and economical factors for network planning: expenses, coverage, link capacity, network complexity and carrier-to-interference ratio (C/I). Base station or access point allocation. Base station and access point equipment. Terminal mobility issues regarding wireless access to the Internet. Wireless networking security issues.

Module V (8 Hours)

Example of laptop or handheld PC wireless connection in real environment. PC wireless interface equipment. Wireless access network exploitation and management, software requirements, link quality control. Business model, wireless network services market, market research and marketing, service

providers, wireless data application service providers (WDASP) and their role on the public telecommunication services market, billing systems.

Module VI (8 Hours)

Recent trends in wireless networking and various access mechanisms, new standards of wireless communication.

Suggested Readings

- M. P. Clark, Wireless Access Networks: Fixed Wireless Access and WLL networks -- Design and Operation, John Wiley & Sons, Chichester
 D. H. Morais, Fixed Broadband Wireless Communications: Principles and Practical Applications, Prentice Hall, Upper Saddle River
 R. Pandya, Introduction to WLLs: Application and Deployment for Fixed and Broadband Services, IEEE Press, Piscataway

CSMS0095 MOBILE APPLICATIONS AND SERVICES

(3 Credits)

Objectives

This course presents the three main mobile platforms and their ecosystems, namely Android, iOS, and PhoneGap/WebOS.

It explores emerging technologies and tools used to design and implement feature-rich mobile applications for smart phones and tablets.

It also take into account both the technical constraints relative to storage capacity, processing capacity, display screen, communication interfaces, and the user interface, context and profile

Course Outcomes

Relate and explain the emerging technologies and tools used to design and implement feature-rich mobile applications for smartphones and tablets. (Remembering, Understanding)

Building the applications for different platform. (Applying)

Analyze the technical constraints relative to storage capacity, processing capacity, display screen, communication interfaces, and the user interface, context and profile. (Analyzing)

Evaluate the results and compare in different environment to have best outcome. (Evaluating)

Create applications as per requirements in suitable environment. (Creating)

Syllabus

Module I (7 Hours)

Introduction: Introduction to Mobile Computing, Introduction to Android Development Environment, Factors in Developing Mobile Applications, Mobile Software Engineering, Frameworks and Tools, Generic UI Development Android User.

Module II (7 Hours)

More on Uis: VUIs and Mobile Apps, Text-to-Speech Techniques, Designing the Right UI, Multichannel and Multimodal Uis, . Storing and Retrieving Data, Synchronization and Replication of Mobile Data, Getting the Model Right, Android Storing and Retrieving Data, Working with a Content Provider.

Module III (9 Hours)

Communications via Network and the Web:State Machine, Correct Communications Model, Android Networking and Web, Telephony Deciding Scope of an App, Wireless Connectivity and Mobile Apps, Android

Telephony, Notifications and Alarms: Performance, Performance and Memory Management, Android Notifications and Alarms, Graphics, Performance and Multithreading, Graphics and UI Performance, Android Graphics.

Module IV (9 Hours)

Putting It All Together: Packaging and Deploying, Performance Best Practices, Android Field Service App, Location Mobility and Location Based Services Android Multimedia: Mobile Agents and Peer-to-Peer Architecture, Android Multimedia.

Module V (8 Hours)

Platforms and Additional Issues: Development Process, Architecture, Design, Technology Selection, Mobile App Development Hurdles, Testing, Security and Hacking, Active Transactions, More on Security, Hacking Android.

Module VI (5 Hours)

Recent trends in Communication protocols for IOT nodes, mobile computing techniques in IOT, agents based communications in IOT.

Suggested Readings

Wei-Meng Lee, Beginning Android™ 4 Application Development, 2012 by John Wiley & Sons

CSSI0096 SMART SENSORS AND INTERNET OF THINGS

(3 Credits)

Objectives

Able to understand the application areas of IOT.

Able to realize the revolution of Internet in Mobile Devices, Cloud & Sensor Networks.

Able to understand building blocks of Internet of Things and characteristics.

Course Outcomes

Explain the revolution of Internet in Mobile Devices, Cloud & Sensor Networks. (Understanding)

Identify the application areas of IOT. (Applying)

Examine the building blocks of Internet of Things and their characteristics. (Analyzing)

Evaluate the results and compare the performance in different environment. (Evaluating)

Construct IoT based products as per requirements for a suitable environment. (Creating)

List and explain the different sensors and illustrate their applications in smart devices. (Remembering)

Syllabus

Module I (7 Hours)

Environmental Parameters Measurement and Monitoring: Why measurement and monitoring are important, effects of adverse parameters for the living being for IOT.

Module II (7 Hours)

Sensors: Working Principles: Different types; Selection of Sensors for Practical Applications Introduction of Different Types of Sensors such as Capacitive, Resistive, Surface Acoustic Wave for Temperature, Pressure, Humidity, Toxic Gas etc.

Module III (9 Hours)

Important Characteristics of Sensors: Determination of the Characteristics Fractional order element: Constant Phase Impedance for sensing applications such as humidity, water quality Impedance Spectroscopy: Equivalent circuit of Sensors and Modelling of Sensors Importance and Adoption of Smart Sensors.

Module IV (10 Hours)

Architecture of Smart Sensors: Important components, their features Fabrication of Sensor and Smart Sensor: Electrode fabrication: Screen printing, Photolithography, Electroplating Sensing film deposition: Physical and chemical Vapor, Anodization, Sol-gel

Module V (7 Hours)

Interface Electronic Circuit for Smart Sensors and Challenges for Interfacing the Smart Sensor, Usefulness of Silicon Technology in Smart Sensor And Future scope of research in smart sensor.

Module VI (5 Hours)

Recent trends in smart sensor for day to day life, evolving sensors and their architecture.

Suggested Readings

Yasuura, H., Kyung, C.-M., Liu, Y., Lin, Y.-L., Smart Sensors at the IoT Frontier, Springer International Publishing.

CSLF0097: LOGIC AND FUNCTIONAL PROGRAMMING

(3 credits)

Objectives:

To further the state of the art on the theoretical and practical aspects of developing declarative programming tools in logic programming for IOT data analysis .

To introduce basics of functional programming and constraint logic programming for nodes in IOT.

Introduction into formal concepts used as a theoretical basis for both paradigms, basic knowledge and practical experience.

Course Outcomes

Define sensors and relate their data collection technique with various criteria set by the users.

(Remembering)

Explain the state of the art on the theoretical and practical aspects of developing declarative programming tools in logic programming for IOT data analysis. (Understanding)

Experiment with the basics of functional programming and constraint logic programming for nodes in IOT. (Applying)

Examine the formal concepts used as a theoretical basis for both paradigms, basic knowledge and practical experience. (Analysing)

Evaluate the results and compare in different environments to have best results. (Evaluating)

Create IoT based products as per requirements in a suitable environment. (Creating)

Module I (5 Hours)

Proposition Logic: Introduction of logic and Functional Paradigm, Propositional Concepts, Semantic Table , Problem Solving with Semantic Table.

Module II (7 Hours)

Natural Deduction and Axiomatic Propositional Logic: Rules of Natural Deduction, Sequent Calculus, Axiomatic Systems, Meta theorems, Important Properties of AL, Resolution, Resolving Arguments

Module III (7 Hours)

Introduction to Predicate Logic Objects, Predicates and Quantifiers, Functions, First Order Language, Quantifiers, Scope and Binding, Substitution, An Axiomatic System for First Order Predicate Logic, Soundness and Completeness, Axiomatic Semantic and Programming

Module IV (12 Hours)

Semantic Tableaux & Resolution in Predicate Logic: Semantic Tableaux, Instantiation Rules, Problem-solving in Predicate Logic, Normal forms, Herbrand Universes and H-interpretation, Resolution, Unification, Resolution as a computing Tool, Nondeterministic Programming, Incomplete Data Structure,

Second Order Programming in Prolog, Logic Grammars: Definite Clause Grammar, A Grammar Interpreter.

Module V (9 Hours)

Lazy and Eager Evaluation strategies: Evaluation Strategies, Lazy Evaluation: Evaluation Order and strictness of function, Programming with lazy evaluation, Interactive functional program, Delay of unnecessary Computation, Infinite Data Structure, Eager Evaluation and Reasoning

Module VI (5 Hours)

Recent trends in logical and functional programming, predicate logics and various evaluation strategies.

Suggested Readings

John Kelly, "The Essence of Logic", Prentice-Hall India.

Saroj Kaushik, "Logic and Prolog Programming", New Age International Ltd

CSNI0112 SENSOR NETWORKS AND INTERNET OF THINGS

(3 credits)

Objectives

The course gives an overview of various topics related to wireless sensor networks, which are expected to be the basis for the emerging internet-of-things.

The course covers topics with relation to various sub disciplines of computer science such as hardware, operating systems, distributed systems, networking, security and databases.

Able to understand wireless sensor network (WSN) specific issues such as localization, time synchronization, and topology control are addressed as well.

Course Outcomes

Define the function of sensors. (Remembering)

Explain how to connect sensors to the environment. (Understanding)

Organize and connect sensors together to have generated output. (Applying)

Examine hardware and software level consideration for IoT sensors. (Analyzing)

Evaluate results from data. (Evaluating)

Creating a real time applications. (Creating)

Syllabus

Module I (7 Hours)

Introduction and Applications: smart transportation, smart cities, smart living, smart energy, smart health, and smart learning. Examples of research areas include for instance: Self-Adaptive Systems, Cyber Physical Systems, Systems of Systems, Software Architectures and Connectors, Software Interoperability, Big Data and Big Data Mining, Privacy and Security.

Module II (8 Hours)

IoT Reference Architecture- Introduction, Functional View, Information View, Deployment and Operational View, Other Relevant architectural views. Real-World Design Constraints- Introduction, Technical Design constraints hardware, Data representation and visualization, Interaction and remote control.

Module III (8 Hours)

Industrial Automation- Service-oriented architecture-based device integration, SOCRADES: realizing the enterprise integrated Web of Things, IMC-AESOP: from the Web of Things to the Cloud of Things, Commercial Building Automation- Introduction, Case study: phase one-commercial building automation today, Case study: phase two- commercial building automation in the future.

Module IV (10 Hours)

Hardware Platforms and Energy Consumption, Operating Systems, Time Synchronization, Positioning and Localization, Medium Access Control, Topology and Coverage Control, Routing: Transport Protocols, Network Security, Middleware, Databases.

Module V (7 Hours)

IOT Physical Devices & Endpoints: What is an IOT Device, Exemplary Device Board, Linux on Raspberry, Interface and Programming & IOT Device

Module VI (5 Hours)

Recent trends in sensor network and IOT architecture, Automation in Industrial aspect of IOT.

Suggested Readings

Mandler, B., Barja, J., MitreCampista, M.E., Cagálová, D., Chaouchi, H., Zeadally, S., Badra, M., Giordano, S., Fazio, M., Somov, A., Vieriu, R.-L., Internet of Things. IoT Infrastructures, Springer International Publishing.

CSDV0105: DATA VISUALISATION

(3 credits)

Objectives:

*familiarize students with the basic and advanced techniques of information visualization and scientific visualization,
to learn key techniques of the visualization process
a detailed view of visual perception, the visualized data and the actual visualization interaction and
distorting techniques*

Course Outcomes

Recall the basic and advanced techniques of information and scientific visualization. (Remembering)
Explain the key techniques of the visualization process. (Understanding)
Apply detailed view of visual perception, the visualized data and the actual visualization, interaction and distorting techniques. (Applying)
Analyse different visualization techniques and their applicability to different types of data. (Analysing)
Compare techniques for visual mapping, geographic data and collaborative visualization. (Evaluating)
Create a process to have an understanding of large-scale abstract data. (Creating)

Module I (8 Hours)

Introduction of visual perception, visual representation of data, Gestalt principles, information overloads.

Module II (8 Hours)

Creating visual representations, visualization reference model, visual mapping, visual analytics, Design of visualization applications.

Module III (8 Hours)

Classification of visualization systems, Interaction and visualization techniques misleading, Visualization of one, two and multi-dimensional data, text and text documents.

Module IV (10 Hours)

Visualization of groups, trees, graphs, clusters, networks, software, Metaphorical visualization

Module V (7 Hours)

Visualization of volumetric data, vector fields, processes and simulations, Visualization of maps, geographic information, GIS systems, collaborative visualizations, Evaluating visualizations

Module VI (4 Hours)

Recent trends in various perception techniques, various visualization techniques, data structures used in

data visualization.

Suggested Readings

WARD, GRINSTEIN, KEIM, .Interactive Data Visualization: Foundations, Techniques, and Applications. Natick : A K Peters, Ltd.

CSAC0113: IOT APPLICATIONS AND COMMUNICATION PROTOCOLS (3 credits)

Objectives

Basic introduction of all the elements of IoT-Mechanical, Electronics/sensor platform, Wireless and wire-line protocols, Mobile to Electronics integration, Mobile to enterprise integration.

Open source/commercial electronics platform for IoT-Raspberry Pi, Arduino ,ArmMbedLPC.

Open source /commercial enterprise cloud platform for IoT-Ayla, iO Bridge, Libellium, Axeda, Cisco fog cloud.

Course Outcomes

Define IoT and respective protocols. (Remembering)

Explain the functions of different layers of communication protocol. (Understanding)

Identify the different functions with respect to different layers. (Applying)

Distinguish protocol and functionalities. (Analyzing)

Evaluate the sensor collected data in connection to communication layer. (Evaluating)

Create applications using different communication protocol. (Creating)

Module I (7 Hours)

Basic function and architecture of a sensor — sensor body, sensor mechanism, sensor calibration, sensor maintenance, cost and pricing structure, legacy and modern sensor network. Development of sensor electronics — IoTvs legacy, and open source vs traditional PCB design style Development of sensor communication protocols, Protocols: Modbus, relay, Zigbee, Zwave, X10,Bluetooth, ANT, etc. Business driver for sensor deployment — FDA/EPA regulation, fraud/ tempering detection, supervision, quality control and process management Different kind of calibration Techniques: manual, automation, infield, primary and secondary calibration — and their implication in IoT Powering options for sensors: battery, solar, Witricity, Mobile and PoE.

Module II (9 Hours)

Zigbee and Zwave — advantage of low power mesh networking. Long distance Zigbee. Introduction to different Zigbee chips. Bluetooth/BLE: Low power vs high power, speed of detection, class of BLE. Introduction of Bluetooth vendors & their review. Wireless protocols such as Piconet and packet structure for BLE and Zigbee Other long distance RF communication link. LOS vs NLOS links, Capacity and throughput calculation Application issues in wireless protocols: power consumption, reliability, PER, QoS, LOS.

Module III (9 Hours)

PCB vs FPGA vs ASIC design Prototyping electronics vs Production electronics, QA certificate for IoT CE/CSA/UL/IEC/RoHS/IP65 Basic introduction of multi-layer PCB design and its workflow Electronics reliability-basic concept of FIT and early mortality rate Environmental and reliability testing-basic concepts Basic Open source platforms: Arduino, Raspberry Pi, Beaglebone.

Module IV (7 Hours)

Introduction to Mobile app platform for IoT: Protocol stack of Mobile app for IoT, Mobile to server integration, iBeacon in IoS, Window Azure, Linkafy Mobile platform for IoT, Axeda, Xively.

Module V (8 Hours)

Database implementation for IoT : Cloud based IoT platforms, SQL vsNoSQL, Open sourced vs. Licensed Database, Available M2M cloud platform, AxedaXively, Omega NovoTech, Ayla Libellium, CISCO M2M platform, AT &T M2M platform, Google M2M platform.

Module VI (5 Hours)

Recent trends in home automation, IOT-locks, Energy optimization in home

Suggested Readings

Olivier Hersent, David Boswarthick, Omar Elloumi, The Internet of Things: Key Applications and Protocols, Wiley-Blackwell.

CSBD0106: BIG DATA ANALYTICS
(3 credits)
Objectives

Understand big data for business intelligence. Learn business case studies for big data analytics.

Understand nosql big data management. Perform map-reduce analytics using Hadoop and relatedtools.

Course Outcomes

Recall and illustrate big data and use cases from selected business domains. (Remembering & Understanding)

Applying NoSQL big data management. (Applying)

Install, configure, and run Hadoop and HDFS and analyze the data. (Analyzing)

Perform map-reduce analytics using Hadoop (Evaluating)

Use Hadoop related tools such as HBase, Cassandra, Pig, and Hive for creating big data analytics. (Creating)

Module I (8 Hours)

What is big data, why big data, convergence of key trends, unstructured data, industry examples of big data, web analytics, big data and marketing, fraud and bigdata, risk and big data, credit risk management, big data and algorithmic trading, big data and healthcare, big data in medicine, advertising and big data, bigdatatechnologies, introduction to Hadoop, open source technologies, cloud and bigdata, mobile business intelligence, Crowd sourcing analytics, inter and transfirewall analytics.

Module II (8 Hours)

Introduction to NoSQL, aggregate data models, aggregates, key-value and document data models, relationships, graph databases, schemaless databases, materialized views, distribution models, sharding, master-slave replication, peer-peer replication, sharding and replication, consistency, relaxing consistency, version stamps, map-reduce, partitioning and combining, composing mapreduce calculations.

Module III (8 Hours)

Data format, Analyzing data with Hadoop, scaling out, Hadoop streaming, Hadoop pipes, design of Hadoop distributed file system (HDFS), HDFS concepts, Java interface, data flow, Hadoop I/O, data integrity, compression, serialization, Avro, file-based data structures.

Module IV (8 Hours)

MapReduce workflows, unit tests with MRUnit, test data and local tests, anatomy of MapReduce job run, classic Map-reduce, YARN, failures in classic Map-reduce and YARN, job scheduling, shuffle and sort, task execution, MapReduce types, input formats, output formats.

Module V (7 Hours)

Hbase, data model and implementations, Hbase clients, Hbase examples, praxis. Cassandra, Cassandra data model, Cassandra examples, Cassandra clients, Hadoop integration.

Module VI (6 Hours)

Pig, Grunt, pig data model, Pig Latin, developing and testing Pig Latin scripts. Hive, data types and file formats, HiveQL data definition, HiveQL data manipulation, HiveQL queries.

Suggested Readings

Olivier Hersent, David Boswarthick, Omar Elloumi, The Internet of Things: Key Applications and Protocols, Wiley-Blackwell.

CSNY0114: NETWORK SECURITY

(3 credits)

Objectives:

To learn the basics of security and various types of security issues.

To study different cryptography techniques available and various security attacks.

Explore network security and how they are implemented in real world.

To get an insight of various issues of Web security and biometric authentication.

Course Outcomes

Recall the basics of security and various types of security issues. (Remembering)

Explain the different cryptography techniques available and various security attacks. (Understanding)

Apply network security and how they are implemented in the real world. (Applying)

Analyse available biometric techniques and how they are used in today's world. (Analysing)

Evaluate the security issues on the web and how to tackle them. (Evaluating)

Elaborate the various issues of web security and biometric authentication. (Creating)

Module I (6 Hours)

Data security: Review of cryptography. Examples RSA, DES, ECC.

Module II (7 Hours)

Authentication, non-repudiation and message integrity. Digital signatures and certificates. Protocols using cryptography (example Kerberos). Attacks on protocols

Module III (9 Hours)

Network security: Firewalls, Proxy-Servers, Network intrusion detection. Transport security: Mechanisms of TLS, SSL, IPsec.

Module IV (10 Hours)

Web security – SQL injection, XSS, etc. Software security and buffer overflow. Malware types and case studies. Access Control, firewalls and host/network intrusion detection.

Module V (8 Hours)

Other topics: Biometric authentication, Secure E-Commerce (ex. SET), Smart Cards, Security in Wireless Communication.

Module VI (5 Hours)

Recent trends in IOT security, IDS and Biometric.

Suggested Readings

W. R. Cheswick and S. M. Bellovin. Firewalls and Internet Security. Addison Wesley, 1994.

W. Stallings. Cryptography and Network Security. Prentice Hall, 1999.

Schneier. Applied Cryptography. Wiley, 1999

CSAM0115: ADVANCED MACHINE LEARNING**(3 credits)****Objectives:**

To introduce key concepts in pattern recognition and machine learning; including specific algorithms for classification, regression, clustering and probabilistic modeling.

To give a broad view of the general issues arising in the application of algorithms to analysing data, common terms used, and common errors made if applied incorrectly.

To demonstrate a toolbox of techniques that can be immediately applied to real world problems, or used as a basis for future research into the topic

Course Outcomes

Recall and explain the key concepts in pattern recognition and machine learning; including specific algorithms for classification, regression, clustering and probabilistic modeling. (Remembering, Understanding)

Explain the general issues arising in the application of algorithms, commonly used terms, and the common errors made if applied incorrectly. (Understanding)

Demonstrate a toolbox of techniques that can be immediately applied to real world problems, or used as a basis for future research into the topic. (Applying)

Analyse the Kernel methods for handling high dimensional and non-linear patterns. (Analysing)

Evaluate the State-of-the-art algorithms such as Support Vector Machines and Bayesian networks. (Evaluating)

Solve real-world machine learning tasks: from data to inference. (Creating)

Module I (7 Hours)

Key concepts, Supervised/Unsupervised Learning, Loss functions and generalization, Probability Theory, Parametric vs Non-parametric methods, Elements of Computational Learning Theory Ensemble Learning, Bagging, Boosting, Random Forest

Module II (7 Hours)

Kernel Methods for non-linear data, Support Vector Machines, Kernel Ridge Regression, Structure Kernels, Kernel PCA, Latent Semantic Analysis

Module III (8 Hours)

Bayesian methods for using prior knowledge and data, Bayesian inference, Bayesian Belief Networks and Graphical models, Probabilistic Latent Semantic Analysis, The Expectation-Maximisation (EM) algorithm, Gaussian Processes

Module IV (9 Hours)

Dimensionality Reduction - CCA, LDA, ICA, NMF – Canonical Variates - Feature Selection vs Feature Extraction

Module V (9 Hours)

Filter Methods - Sub-space approaches - Embedded methods, Low-Rank approaches - Recommender Systems Application areas - Security - Business - Scientific

Module VI (5 Hours)

Recent trends in supervised and unsupervised learning algorithm, dimensional reducibility, feature selection and extraction

Suggested Readings

Christopher M. Bishop, Pattern Recognition and Machine Learning.

John Shawe-Taylor and Nello Cristianini, Kernel Methods for Pattern Analysis

CSDV6079: DATA VISUALISATION LAB

(2 credits)

Course Outcomes

Recall the design process to develop visualization methods and visualization systems, and methods for their evaluation. (Remembering)

Create and process data and visual mapping and the visualization (Creating).

Illustrate an understanding of large-scale abstract data. (Understanding)

Analyse data in various perspectives. (Analysing)

Evaluate the results generated from various applications. (Evaluating)

Create visualization methods for different applications. (Creating)

List of Experiments

Program to recursively subdivide a tetrahedron to form a 3D Sierpinski gasket. The number of recursive steps is to be specified by the user.

Program to implement Liang-Barsky line clipping algorithm.

Program to draw a color cube and spin it using OpenGL transformation matrices.

Program to create a house-like figure and rotate it about a given fixed point using OpenGL functions.

Program to implement the Cohen-Sutherland line-clipping algorithm. Make provision to specify the input line, window for clipping and view port for displaying the clipped image.

Program to create a cylinder and a parallelepiped by extruding a circle and quadrilateral respectively. Allow the user to specify the circle and the quadrilateral.

Program, using OpenGL functions, to draw a simple shaded scene consisting of a teapot on a table.

Define suitably the position and properties of the light source along with the properties of the properties of the surfaces of the solid object used in the scene.

Program to draw a color cube and allow the user to move the camera suitably to experiment with perspective viewing. Use OpenGL functions.

Program to fill any given polygon using scan-line area filling algorithm. (Use appropriate data structures.)

Program to display a set of values {fij} as a rectangular mesh. Project: 11. Develop a suitable Graphics package to implement the skills learnt in the theory and the exercises indicated in Part A. Use the OpenGL..

CSCL0135: CLOUD COMPUTING

(3 credits)

Objectives:

The student will also learn how to apply trust-based security model to real-world security problems.

An overview of the concepts, processes, and best practices needed to successfully secure information within Cloud infrastructures.

Students will learn the basic Cloud types and delivery models and develop an understanding of the risk and compliance responsibilities and Challenges for each Cloud type and service delivery model.

Course Outcomes

The basics of cloud computing (Remembering)

Illustrate cloud computing architecture and cloud computing model (Understanding)

Identify and apply security aspects of each cloud model (Applying)

Analyse a risk management strategy for moving to the cloud (Analysing)

Implement and evaluate a public cloud instance using a public cloud service provider (Evaluating)

Create a trust based security model to different layer (Creating)

Module I (10 Hours)

Introduction to Cloud Computing

Online Social Networks and Applications, Cloud introduction and overview, Different clouds, Risks, Novel applications of cloud computing.

Module II (11 Hours)

Cloud Computing Architecture Requirements, Introduction Cloud computing architecture, On Demand Computing Virtualization at the infrastructure level, Security in Cloud computing environments, CPU Virtualization, A discussion on Hypervisors Storage Virtualization Cloud Computing Defined, The SPI Framework for Cloud Computing, The Traditional Software Model, The Cloud Services Delivery Model Cloud Deployment Models Key Drivers to Adopting the Cloud, The Impact of Cloud Computing on Users, Governance in the Cloud, Barriers to Cloud Computing Adoption in the Enterprise

Module III (10 hours)

Security Issues in Cloud Computing, Infrastructure Security, Infrastructure Security: The Network Level, The Host Level, The Application Level, Data Security and Storage, Aspects of Data Security, Data Security Mitigation Provider Data and Its Security

Identity and Access Management, Trust Boundaries and IAM, IAM Challenges, Relevant IAM Standards and Protocols for Cloud Services, IAM Practices in the Cloud, Cloud Authorization Management

Module IV (11 hours)

Security Management in the Cloud: Security Management Standards, Security Management in the Cloud, Availability Management: SaaS, PaaS, IaaS

Privacy Issues: Privacy Issues, Data Life Cycle, Key Privacy Concerns in the Cloud, Protecting Privacy, Changes to Privacy Risk Management and Compliance in Relation to Cloud Computing, Legal and Regulatory Implications,

U.S. Laws and Regulations, International Laws and Regulations.

Module V (8 hours)

Audit and Compliance: Internal Policy Compliance, Governance, Risk, and Compliance (GRC), Regulatory/ External Compliance, Cloud Security Alliance, Auditing the Cloud for Compliance, Security-as-a-Cloud

Module VI (4 hours)

ADVANCED TOPICS: Recent developments in hybrid cloud and cloud security

Suggested Readings

Cloud Computing Explained: Implementation Handbook for Enterprises, John Rhoton, Publication

Date: November 2, 2009

Cloud Security and Privacy: An Enterprise Perspective on Risks and Compliance (Theory in Practice),
Tim Mather, ISBN-10: 0596802765, O'Reilly Media, September 2009

CSIS0137IOT AND SMART CITIES (3 Credits)

Objectives

Explain the basic methodologies and techniques of the arts and humanities, social sciences, business, and science and technology

To describe the current practices and future trends about smart city

Capacity of critique the current practice and provide recommendations

Course Outcomes

List the various applications of smart cities (Remembering)

Explain the IoT reference architecture, fundamental knowledge of the sustainable and smart city (Understanding)

Identify different technologies used for sustainable smart cities (Applying)

Analyze the learnt knowledge to conduct a case study in an organized way. (Analyzing)

Estimate the ability to present the study clearly to audiences; Demonstration of critical thinking and discovering. (Evaluating)

Formulate the methods to design public mobile services aimed at efficiency, cost-saving and participation with attention for e-inclusion (Creating)

Module I (8 hours)

Introduction and Applications: smart transportation, smart cities, smart living, smart energy, smart health, and smart learning.

Module II (9 hours)

IoT Reference Architecture- methods to assist local governments to develop international good e-practice

Module III (8 hours)

Methods to redesign and redefine back and front offices in order to build smarter and transparent governments

Module IV (8 hours)

Methods to design public mobile services aimed at efficiency, cost-saving and participation with attention for e-inclusion

Module V (10 hours)

Methodologies for user involvement, profiling customers and identifying needs; test methodologies to transfer these needs in appropriate services; and test techniques to fit the right channel to the specific services and customers thereby setting a framework for a higher level of e-services in the NSR

Module VI (5 hours)

Pilot new service channels, bluetooth services for public transport, online forms in mobile phones and wireless city services

Suggested Readings

Smart City on Future Life - Scientific Planning and Construction by Xianyi Li

The Age of Intelligent Cities: Smart Environments and Innovation-for-all Strategies (Regions and Cities) by Nicos Komninos

Smart Cities: Big Data, Civic Hackers, and the Quest for a New Utopia by Anthony Townsend.

CSEM0138: EMULATION AND SIMULATION METHODOLOGIES

(3 Credits)

Objectives

This module teaches the fundamentals of simulation and emulation methodologies providing guidance on how to design a performance evaluation campaign

Set up a test scenario, select the appropriate models, level of granularity

Metrics for statistical correctness, and discuss the differences between simulation and emulation platforms and how to use them for accurate performance evaluation of communications.

Course Outcomes

Define and explain the fundamental concepts of Discrete Event Simulations. (Remembering)

Explain about the communication and networking techniques used in DES. (Understanding)

Identify the various Application-based Granularity Requirements. (Applying)

Analyze the performance evaluation of Statistical Tools (Analyzing)

Assess the evaluation of communications for ITS. (Evaluating)

Discuss the recent trends of simulation and emulation for IOT. (Creating)

Module I (8 hours)

Fundamentals of Discrete Event Simulations (DES)

Module II (8 hours)

Model-based representation for DES, from communication and networking, to mobility and data traffic.

Module III (8 hours)

Application-based Granularity Requirements: from bit-level, packet-level, to system-level evaluation, and their appropriate selection as a function of the application requirements.

Module IV (12 hours)

Fundamentals on Random Numbers, Fundamentals on Statistical Tools for Performance Evaluation, Simulation vs. Emulations

Module V (8 hours)

Case study for the evaluation of communications for ITS.

Module VI (4 hours)

Recent trends in simulation and emulation for IOT, model based and application based granularity presentation

Suggested Readings

CSDT0087ADVANCED DATA STRUCTURES**(3 Credits)****Course Outcomes**

Recall the mathematical background and abstractions for analysis of algorithms. (Remembering)

Explain the implementation of symbol tables using hashing techniques. (Understanding)

Apply amortized analysis on data structures, including binary search trees, mergeable heaps, and disjoint sets. (Applying)

Analyse algorithms for red-black trees, B-trees and Splay trees. (Analysing)

Determine and evaluate algorithms for text processing applications. (Evaluating)

Choose suitable data structures and develop algorithms for computational geometry problems. (Creating)

Syllabus**Module 1 (7 Hours)**

Dictionaries: Definition, Dictionary Abstract Data Type, Implementation of Dictionaries.

Hashing: Review of Hashing, Hash Function, Collision Resolution Techniques in Hashing, Separate Chaining, Open Addressing, Linear Probing, Quadratic Probing, Double Hashing, Rehashing, Extendible Hashing.

Module 2 (5 Hours)

Skip Lists: Need for Randomizing Data Structures and Algorithms, Search and Update Operations on Skip Lists, Probabilistic Analysis of Skip Lists, Deterministic Skip Lists

Module 3 (7 Hours)

Trees: Binary Search Trees, AVL Trees, Red Black Trees, 2-3 Trees, B-Trees, Splay Trees

Module 4 (11 Hours)

Text Processing: String Operations, Brute-Force Pattern Matching, The Boyer-Moore Algorithm, The Knuth-Morris-Pratt Algorithm, Standard Tries, Compressed Tries, Suffix Tries, The Huffman Coding Algorithm, The Longest Common Subsequence Problem (LCS), Applying Dynamic Programming to the LCS Problem.

Module 5 (10 Hours)

Computational Geometry: One Dimensional Range Searching, Two Dimensional Range Searching, Constructing a Priority Search Tree, Searching a Priority Search Tree, Priority Range Trees, Quadrees, k-D Trees.

Module 6 (5 Hours)

Recent Trends in Hashing, Trees, and various computational geometry methods for efficiently solving the new evolving problem

Suggested Readings

Mark Allen Weiss, Data Structures and Algorithm Analysis in C++, 2nd Edition, Pearson, 2004.

M T Goodrich, Roberto Tamassia, Algorithm Design, John Wiley, 2002.

CSDF0098 DIGITAL FORENSICS (3 Credits)

Course Outcomes

Recall the computer forensics related features of relevant legislations. (Remembering)

Explain the digital forensics related processes and procedures. (Understanding)

Utilize e-discovery tools to gather evidence from computers, mobiles, network, emails and the web. (Applying)

Analyse gathered forensics data to conduct an investigation. (Analysing)

Criticize a digital forensics related case. (Evaluating)

Formulate plans for investigating real-world cyber-crimes. (Creating)

Module 1 (8 Hours)

Digital Forensics Science: Forensics science, computer forensics, and digital forensics.

Computer Crime: Criminalistics as it relates to the investigative process, analysis of cyber- criminalistics area, holistic approach to cyber-forensics

Module 2 (7 Hours)

Cyber Crime Scene Analysis: Discuss the various court orders etc., methods to search and seizure electronic evidence, retrieved and un-retrieved communications, Discuss the importance of understanding what court documents would be required for a criminal investigation.

Module 3 (8 Hours)

Evidence Management & Presentation: Create and manage shared folders using operating system, importance of the forensic mindset, define the workload of law enforcement, Explain what the normal case would look like, Define who should be notified of a crime, parts of gathering evidence, Define and apply probable cause.

Module 4 (10 Hours)

Computer Forensics: Prepare a case, Begin an investigation, Understand computer forensics workstations and software, Conduct an investigation, Complete a case, Critique a case, Network Forensics: open-source security tools for network forensic analysis, requirements for preservation of network data.

Module 5 (8 Hours)

Mobile Forensics: mobile forensics techniques, mobile forensics tools. Legal Aspects of Digital Forensics: IT Act 2000, amendment of IT Act 2008

Module 6 (4 Hours)

Recent trends in mobile forensic technique and methods to search and seizure electronic evidence

Suggested Readings

John Sammons, The Basics of Digital Forensics, Elsevier

John Vacca, Computer Forensics: Computer Crime Scene Investigation, Laxmi Publications

CSEH0099 ETHICAL HACKING (3 Credits)

Course Outcomes

Recall the features of various cyber laws related to ethical hacking and the code of ethics for ethical hacking. (Remembering)

Explain the terms penetration testing, vulnerability analysis, and malware analysis. (Understanding)
 Utilize various tools to gather data for penetration testing, vulnerability analysis, and malware analysis. (Applying)
 Analyse gathered data to discover vulnerabilities. (Analysing)
 Assess the exploitability of vulnerabilities present in a software or hardware. (Evaluating) CO6:
 Maximize a detected vulnerability to hack a computer, mobile or network. (Creating)

Module 1 (9 Hours)

Introduction to Ethical Disclosure: Ethics of Ethical Hacking, Ethical Hacking and the legal system, Proper and Ethical Disclosure

Module 2 (8 Hours)

Penetration Testing and Tools: Using Metasploit, Using Back Track Live CD Linux Distribution

Module 3 (9 Hours)

Vulnerability Analysis: Passive Analysis, Advanced Static Analysis with IDA Pro, Advanced Reverse Engineering

Module 4 (10 Hours)

Client-side browser exploits, Exploiting Windows Access Control Model for Local Elevation Privilege, Intelligent Fuzzing with Sulley, From Vulnerability to Exploit

Module 5 (5 Hours)

Malware Analysis: Collecting Malware and Initial Analysis, Hacking Malware

Module 6 (4 Hours)

Case study of vulnerability of cloud platforms and mobile platforms & devices.

Suggested Readings

Shon Harris, Allen Harper, Chris Eagle and Jonathan Ness, Gray Hat Hacking: The Ethical Hackers' Handbook, TMH Edition
 Jon Erickson, Hacking: The Art of Exploitation, SPD

CSID0100 INTRUSION DETECTION

(3 Credits)

Course Outcomes

Recall the fundamentals and history of Intrusion Detection in order to avoid common pitfalls in the creation and evaluation of new Intrusion Detection Systems. (Remembering)
 Explain the different classes of attacks and anomaly detection systems and algorithms. (Understanding)

Identify and describe the parts of all intrusion detection systems and characterize new and emerging IDS technologies according to the basic capabilities all intrusion detection systems share. (Applying)
 Compare alternative tools and approaches for Intrusion Detection through quantitative analysis to determine the best tool or approach to reduce risk from intrusion. (Analysing)
 Evaluate the security posture of an enterprise. (Evaluating)
 Formulate a plan to secure an enterprise network using an appropriate intrusion detection system. (Creating)

Module 1 (9 Hours)

The state of threats against computers, and networked systems-Overview of computer security solutions and why they fail-Vulnerability assessment, firewalls, VPN's -Overview of Intrusion Detection and Intrusion Prevention Network and Host-based IDS

Module 2 (8 Hours)

Classes of attacks - Network layer: scans, denial of service, penetration Application layer: software exploits, code injection-Human layer: identity theft, root access-Classes of attackers-Kids/hackers/ sophisticated groups-Automated: Drones, Worms, Viruses

Module 3 (8 Hours)

A General IDS model and taxonomy, Signature-based Solutions, Snort, Snort rules, Evaluation of IDS, Cost sensitive IDS

Module 4 (8 Hours)

Anomaly Detection Systems and Algorithms-Network Behavior Based Anomaly Detectors (rate based)-Host-based Anomaly Detectors-Software Vulnerabilities State transition, Immunology, Payload Anomaly Detection

Module 5 (8 Hours)

Attack trees and Correlation of alerts-Autopsy of Worms and Botnets-Malware Detection- Obfuscation, polymorphism-Dynamic vectors

Module 6 (4 Hours)

Email/IM security issues-Viruses/Spam-From signatures to thumbprints to zero day detection- Insider Threat issues-Taxonomy-Masquerade and Impersonation Traitors, Decoys and Deception- Future: Collaborative Security

Suggested Readings

The Art of Computer Virus Research and Defense, Peter Szor, SymantecPress ISBN 0-32130545-3
 Crimeware, Understanding New Attacks and Defenses, Markus Jakobsson and Zulfikar Ramzan, Symantec Press, ISBN: 978-0-321-50195-0 2008

CSMR0101 MALWARE ANALYSIS & REVERSE ENGINEERING

(3 Credits)

Course Outcomes

Recall an insight of fundamentals of malware analysis (Remembering)
 Explain the concept of malware and reverse engineering. (Understanding)
 Utilize tools and techniques of malware analysis (Applying)
 Analyse data with respect to Malware and Kernel Debugging (Analysing)
 Evaluate results from analysed data. (Evaluating)
 Create an environment to protect malware. (Creating)

Module 1 (11 Hours)

Fundamentals of Malware Analysis (MA), Reverse Engineering Malware (REM) Methodology, Brief Overview of Malware analysis lab setup and configuration, Introduction to key MA tools and techniques, Behavioral Analysis vs. Code Analysis, Resources for Reverse-Engineering Malware (REM) Understanding Malware Threats, Malware indicators, Malware Classification, Examining ClamAV Signatures, Creating Custom ClamAV Databases, Using YARA to Detect Malware Capabilities, Creating a Controlled and Isolated Laboratory, Introduction to MA Sandboxes, Ubuntu, Zeltser's REMnux, SANS SIFT, Sandbox-Setup and Configuration New Course Form, Routing TCP/IP Connections, Capturing and Analysing Network Traffic, Internet simulation using INetSim, Using Deep Freeze to Preserve Physical Systems, Using FOG for Cloning and Imaging Disks, Using MySQL Database to Automate FOG Tasks, Introduction to Python, Introduction to x86 Intel assembly language, Scanners: Virus Total, Jotti, and NoVirus Thanks, Analysers: Threat Expert, CWSandbox, Anubis, Joebox, Dynamic Analysis Tools: Process Monitor, Regshot, HandleDiff, Analysis Automation Tools: Virtual Box, VM Ware, Python, Other Analysis Tools

Module 2 (6 Hours)

Using TSK for Network and Host Discoveries, Using Microsoft Offline API to Registry Discoveries, Identifying Packers using PEiD, Registry Forensics with Reg Ripper Plu-gins:, Bypassing Poison Ivy's Locked Files, Bypassing Conficker's File System ACL Restrictions, Detecting Rogue PKI Certificates.

Module 3 (8 Hours)

Opening and Attaching to Processes, Configuration of JIT Debugger for Shellcode Analysis, Controlling Program Execution, Setting and Catching Breakpoints, Debugging with Python Scripts and Py Commands, DLL Export Enumeration, Execution, and Debugging, Debugging a VMware Workstation Guest (on Windows), Debugging a Parallels Guest (on Mac OS X). Introduction to WinDbg Commands and Controls, Detecting Rootkits with WinDbg Scripts, Kernel Debugging with IDA Pro.

Module 4 (8 Hours)

Memory Dumping with MoonSols Windows Memory Toolkit, Accessing VM Memory Files Overview of Volatility, Investigating Processes in Memory Dumps, Code Injection and Extraction, Detecting and Capturing Suspicious Loaded DLLs, Finding Artifacts in Process Memory, Identifying Injected Code with Malfind and YARA.

Module 5 (7 Hours)

Using WHOIS to Research Domains, DNS Hostname Resolution, Querying Passive DNS, Checking DNS Records, Reverse IP Search New Course Form, Creating Static Maps, Creating Interactive Maps.

Module 6 (5 Hours)

Case study of Finding Artifacts in Process Memory, Identifying Injected Code with Malfind and YARA

Suggested Readings

Michael Sikorski, Andrew Honig "Practical Malware Analysis: The Hands-On Guide to Dissecting Malicious Software" publisher William Pollock

CSSC0102 SECURE SOFTWARE DESIGN AND ENTERPRISE COMPUTING

(3 Credits)

Course Outcomes

Recall the various software vulnerabilities. (Remembering)

Explain the software process vulnerabilities for an organization. (Understanding)

Apply techniques for successfully implementing and supporting network services on an enterprise scale and heterogeneous systems environment (Applying)

Analyse and monitor resources consumption in a software. (Analysing)

Evaluate results by interrelating security and software development process. (Evaluating)

Create methodologies and tools to design and develop secure software containing minimum vulnerabilities and flaws. (Creating)

Syllabus

Module 1 (8 Hours)

Secure Software Design Identify software vulnerabilities and perform software security analysis, Master security programming practices, Master fundamental software security design concepts, Perform security testing and quality assurance

Module 2 (9 Hours)

Enterprise Application Development Describe the nature and scope of enterprise software applications, Design distributed N-tier software application, Research technologies available for the presentation, business and data tiers of an enterprise software application, Design and build a database using an enterprise database system, Develop components at the different tiers in an enterprise system, Design and develop a multi-tier solution to a problem using technologies used in enterprise system, Present software solution.

Module 3 (8 Hours)

Enterprise Systems Administration Design, implement and maintain a directory-based server infrastructure in a heterogeneous systems environment, Monitor server resource utilization for system reliability and availability, Install and administer network services (DNS/DHCP/Terminal Services/Clustering/Web/Email).

Module 4 (8 Hours)

Obtain the ability to manage and troubleshoot a network running multiple services, Understand the requirements of an enterprise network and how to go about managing them.

Module 5 (8 Hours)

Handle insecure exceptions and command/SQL injection, Defend web and mobile applications against attackers, software containing minimum vulnerabilities and flaws.

Module 6 (4 Hours)

Case study of DNS server, DHCP configuration and SQL injection attack.

Suggested Readings

Theodor Richardson, Charles N Thies, Secure Software Design, Jones & Bartlett
Kenneth R. van Wyk, Mark G. Graff, Dan S. Peters, Diana L. Burley, Enterprise SoftwareSecurity, Addison Wesley

CSDT6076 ADVANCED DATA STRUCTURES LAB

(3 Credits)

Course Outcomes:

Demonstrate and explain the various operations of Binary search trees. (Understanding)

Develop a program to implement B-Trees and 2-3 Trees. (Applying)

Develop a program and test for the pattern matching algorithms like Bayer-Moore and Knuth-Morris-Pratt algorithms. (Creating)

Demonstrate the implementation of compression algorithms using program. (Understanding)

Develop algorithms for text processing applications. (Creating)

Program List:

Experiment No.	List of Experiments

Module 1

- 1 Implementation of BST and AVL trees.
- 2 Implementation of 2-3 trees, B-trees.
- 3 Implementation of Red Black Trees

Module 2

- 4 Pattern matching using Boyer-Moore algorithm.
- 5 Knuth-Morris-Pratt algorithm for pattern matching.

Module 3

- 6 Huffman Algorithm for data compression.
- 7 Finding Longest Common Subsequence using a dynamic programming technique.
- 8 Implementation of Standard tries, Suffix tries and Compressed tries

Module 4

- 9 Construction of Priority Search Trees, Searching in a Priority Search Tree.
- 10 Construction of Priority range Trees

Module 5

- 11 Implementation of Quad Trees

Suggested Readings:

1. Mark Allen Weiss, Data Structures and Algorithm Analysis in C++, 2nd Edition, Pearson, 2004.
2. M T Goodrich, Roberto Tamassia, Algorithm Design, John Wiley, 2002.

CO 5						H

CSAA0103: ADVANCED ALGORITHMS
(3 credits)
Course Outcomes

Recall different algorithms (Remembering)

Explain the applications of various algorithms (Understanding)

Apply computer algorithms for different purposes. (Applying)

Analyse the complexity/ performance of different algorithms. Categorize the different problems in various classes according to their complexity. (Analysing)

Evaluate the different problems in various classes according to their complexity. (Evaluation)

Elaborate the recent activities in the field of the advanced data structure. (Creating)

Module 1 (6 Hours)

Sorting: Review of various sorting algorithms, topological sorting

Graph: Definitions and Elementary Algorithms: Shortest path by BFS, shortest path in edge weighted case (Dijkstra's), depth-first search and computation of strongly connected, components, emphasis on correctness proof of the algorithm and time/space analysis, example of amortized analysis.

Module 2 (7 Hours)

Matroids: Introduction to greedy paradigm, algorithm to compute a maximum weight maximal independent set. Application to MST.

Graph Matching: Algorithm to compute maximum matching. Characterization of maximum matching by augmenting paths, Edmond's Blossom algorithm to compute augmenting paths.

Module 3 (8 Hours)

Flow-Networks: Maxflow-mincut theorem, Ford-Fulkerson Method to compute, maximum flow, Edmond-Karp maximum-flow algorithm.

Matrix Computations: Strassen's algorithm and introduction to divide and conquer paradigm, inverse of a triangular matrix, relation between the time complexities of basic matrix operations, LUP-decomposition.

Module 4 (9 Hours)

Shortest Path in Graphs: Floyd-Warshall algorithm and introduction to dynamic programming paradigm. More examples of dynamic programming.

Modulo Representation of integers/polynomials: Chinese Remainder Theorem, Conversion between base-representation and modulo-representation. Extension to polynomials. Application: Interpolation problem.

Discrete Fourier Transform (DFT): In complex field, DFT in modulo ring. Fast Fourier Transform algorithm. Schonhage-Strassen Integer Multiplication algorithm

Module 5 (10 Hours)

Linear Programming: Geometry of the feasibility region and Simplex algorithm NP-completeness: Examples, proof of NP-hardness and NP-completeness.

One or more of the following topics based on time and interest Approximation algorithms, Randomized Algorithms, Interior Point Method, Advanced Number Theoretic Algorithm

Module 6 (5 Hours)

Recent Trends in problem solving paradigms using recent searching and sorting techniques by applying recently proposed data structures.

Suggested Readings

1. "Introduction to Algorithms" by Cormen, Leiserson, Rivest, Stein.
2. "The Design and Analysis of Computer Algorithms" by Aho, Hopcroft, Ullman.
3. "Algorithm Design" by Kleinberg and Tardos.

CSEC0116: DATA ENCRYPTION AND COMPRESSION (3 Credits)

Course Outcomes

List the different encryption techniques adopted in both traditional and modern cryptographic mechanisms. (Remembering)

Infer the logic adopted in different cryptographic algorithms, and their countermeasures. (Understanding)

Apply the concepts gathered from the fundamentals of cryptographic approaches in solving related problems. (Applying)

Analyse the working of the different encryption and compression algorithms. (Analysing)

Compare and contrast the working of different data encryption and compression mechanisms. (Evaluating)

Choose appropriate encryption and compression algorithms to build real-world systems. (Creating)

Module 1 (8 Hours)

Introduction to Security: Need for security, Security approaches, Principles of security, Types of attacks. Encryption Techniques: Plaintext, Cipher text, Substitution Vs Transposition techniques, Encryption & Decryption, Types of attacks, Key range & Size.

Module 2 (10 Hours)

Symmetric & Asymmetric Key Cryptography: Algorithm types & Modes, DES, IDEA, Differential & Linear Cryptanalysis, RSA, Symmetric & Asymmetric key together, Digital signature, Knapsack algorithm. User Authentication Mechanism: Authentication basics, Passwords, Authentication tokens, Certificate based & Biometric authentication, Firewall.

Module 3 (9 Hours)

Case Studies Of Cryptography: Denial of service attacks, IP spoofing attacks, Secure inter branch payment transactions, Conventional Encryption and Message Confidentiality, Conventional Encryption Principles, Conventional Encryption Algorithms, Location of Encryption Devices, Key Distribution. Public Key Cryptography and Message Authentication: Approaches to Message Authentication, SHA-1, MD5, Public-Key Cryptography Principles, RSA, Digital, Signatures, Key Management.

Module 4 (7 Hours)

Introduction: Need for data compression, Fundamental concept of data compression coding, Communication model, Compression ratio, Requirements of data compression, Classification. Methods of Data Compression: Data compression-- Loss less and Lossy.

Module 5 (10 Hours)

Entropy encoding-- Repetitive character encoding, Run length encoding, Zero/Blank encoding; Statistical encoding-- Huffman, Arithmetic & Lempel-Ziv coding; Source encoding-- Vector quantization (Simple vector quantization & with error term); Differential encoding-- Predictive coding, Differential pulse code modulation, Delta modulation, Adaptive differential pulse code modulation; Transform based coding : Discrete cosine transform JPEG standards; Fractal compression

Module 6 (4 Hours)

Recent trends in encryption and data compression techniques.

Suggested Readings

1. Cryptography and Network Security by B. Forouzan, McGraw-Hill.
2. The Data Compression Book by Nelson, BPB.
3. Cryptography & Network Security by AtulKahate, TMH.

CSSW0117: STEGANOGRAPHY AND DIGITAL WATERMARKING
(3 Credits)
COURSE OUTCOMES

Define the terms Steganography, Steganalysis and Digital Watermarking. (Remembering)
 Explain the various techniques for Steganography, Steganalysis and Digital Watermarking. (Understanding)
 Utilize various tools available to perform Steganography. (Applying)
 Analyse data to detect and extract hidden information. (Analysing)
 Defend against steganography and digital watermarking attacks. (Evaluating)
 Develop frameworks for secure communication. (Creating)

Module 1 (8 Hours)

Steganography: Overview, History, Methods for hiding (text, images, audio, video, speech etc.), Issues: Security, Capacity and Imperceptibility, Steganalysis: Active and Malicious Attackers, Active and passive steganalysis.

Module 2 (10 Hours)

Frameworks for secret communication (pure Steganography, secret key, public key steganography), Steganography algorithms (adaptive and non-adaptive),

Module 3 (7 Hours)

Steganography techniques: Substitution systems, Spatial Domain, Transform domain techniques, Spread spectrum, Statistical steganography, Cover Generation and cover selection, Tools: EzStego, FFEncode, Hide 4PGP, Hide And Seek, S Tools etc.)

Module 4 (5 Hours)

Detection, Distortion, Techniques: LSB Embedding, LSB Steganalysis using primary sets, Texture based

Module 5 (10 Hours)

Digital Watermarking: Introduction, Difference between Watermarking and steganography, History, Classification (Characteristics and Applications), Types and techniques (Spatial-domain, Frequency-domain, and Vector quantization based watermarking), Attacks and Tools (Attacks by Filtering, Re-modulation, Distortion, Geometric Compression, Linear Compression etc.), Watermark security & authentication.

Module 6 (5 Hours)

Recent trends in Steganography and digital watermarking techniques. Case study of LSB Embedding, LSB Steganalysis using primary sets.

Suggested Readings

Peter Wayner, "Disappearing Cryptography—Information Hiding: Steganography & Watermarking", Morgan Kaufmann Publishers, New York, 2002.

Ingemar J. Cox, Matthew L. Miller, Jeffrey A. Bloom, Jessica Fridrich, TonKalker, "Digital Watermarking and Steganography", Morgan Kaufmann Publishers, New York, 2008.

Information Hiding: Steganography and Watermarking—Attacks and Countermeasures by Neil F. Johnson, Zoran Duric, Sushil Jajodia.

CSIT0118: INFORMATION THEORY AND CODING

(3 Credits)

Course Outcomes

List the various coding and compression techniques. (Remembering)

Explain the working of lossless and lossy compression techniques. (Understanding)

Apply encoding techniques to encode data and perform error detection and correction.

(Applying)

Compare the various coding and compression techniques for text, video and image. (Analysing)

Measure information in terms of probability and entropy. (Evaluating)

Combine compression and coding techniques to build end-to-end systems. (Creating)

Module 1 (8 Hours)

Information and entropy information measures, Shannon's concept of Information. Channel coding, channel mutual information capacity (BW)

Module 2 (10 Hours)

Theorem for discrete memory less channel, information capacity theorem, Error Detecting and error correcting codes

Module 3 (8 Hours)

Types of codes: block codes, Hamming and Lee metrics, description of linear block codes, parity check Codes, cyclic code, Masking techniques

Module 4 (5 Hours)

Compression: loss less and lossy, Huffman codes, LZW algorithm, Binary Image compression schemes, run length encoding, CCITT group 3 1-D Compression, CCITT group 3 2D compression, CCITT group 4 2D Compression.

Module 5 (10 Hours)

Convolutional codes, sequential decoding. Video image Compression: CITT H261 Video coding algorithm, audio (speech) Compression. Cryptography and cipher.

Module 6 (4 Hours)

Case study of CCITT group 3 1-DCompression, CCITT group 3 2Dcompression.

Suggested Readings

Fundamentals in information theory and coding, Monica Borda, Springer.

Communication Systems: Analog and digital, Singh and Sapre, TataMcGraw Hill. Multimedia

Communications Fred Halsall.

Information Theory, Coding and Cryptography R Bose.

Multimedia system Design Prabhat K Andleigh and KiranThakrar.

CO 1	H	M				
CO 2	M	H	M	L		
CO 3	L	M	H	M		
CO 4		L	M	H	M	
CO 5				L	H	M
CO 6					M	H

CSRA0119: SECURITY ASSESSMENT AND RISK ANALYSIS

(3 Credits)

Course Outcomes

List and define the various Contingency Planning components. (Remembering)

Explain the escalation process from incident to disaster in case of security disaster. (Understanding)

Plan countermeasures to threats. (Applying)

Analyse risks. (Analysing)

Recommend contingency strategies including data backup and recovery and alternate site selection for business resumption planning. (Evaluating)

Design Incident Response Plan, Disaster Recovery Plan and Business Continuity Plan for sustained organizational operations. (Creating)

Module 1 (8 Hours)

SECURITY BASICS: Information Security (INFOSEC) Overview: critical information characteristics – availability information states – processing security counter measures education, training and awareness, critical information characteristics – confidentiality critical information characteristics–integrity, information-states – storage, information states – transmission, security countermeasures -policy, procedures and practices, threats, vulnerabilities.

Module 2 (11 Hours)

Threats to and Vulnerabilities of Systems: definition of terms (e.g., threats, vulnerabilities, risk), major categories of threats (e.g., fraud, Hostile Intelligence Service (HOIS), malicious logic, hackers, environmental and technological hazards, disgruntled employees, careless employees, HUMINT, and monitoring), threat impact areas, Countermeasures: assessments (e.g., surveys, inspections), Concepts of Risk Management: consequences (e.g., corrective action, risk assessment), cost/ benefit analysis of controls, implementation of cost effective controls, monitoring the efficiency and effectiveness of controls (e.g., unauthorized or inadvertent disclosure of information), threat and vulnerability assessment

Module 3 (8 Hours)

Security Planning: directives and procedures for policy mechanism, Risk Management: acceptance of risk (accreditation), corrective actions information identification, risk analysis and/or vulnerability assessment components, risk analysis results evaluation, roles and responsibilities of all the players in the risk analysis process, Contingency Planning/Disaster Recovery: agency response procedures and continuity of operations, contingency plan components, determination of backup requirements, development of plans for recovery actions after a disruptive event, development of procedures for off-site processing, emergency destruction procedures, guidelines for determining critical and essential workload, team member responsibilities in responding to an emergency situation

Module 4 (7 Hours)

Policies and Procedures Physical Security Measures: alarms, building construction, cabling, communications centre, environmental controls (humidity and air conditioning), filtered power, physical access control-

systems (key cards, locks and alarms) Personnel Security Practices and Procedures: access authorization/ verification(need-to-know), contractors, employee clearances, position sensitivity, security training and awareness, systems maintenance personnel, Administrative Security Procedural Controls: attribution, copyright protection and licensing, Auditing and Monitoring: conducting security reviews, effectiveness of security programs, investigation of security breaches, privacy review of accountability controls, review of audit trails and logs

Module 5 (8 Hours)

Operations Security (OPSEC): OPSEC surveys/OPSEC planning INFOSEC: computer security – audit, Cryptography-encryption (e.g., point-to-point network, link), cryptography-key management (to include electronic key), cryptography-strength (e.g., complexity, secrecy, characteristics of the key)

Module 6 (3 Hours)

Case study of threat and vulnerability assessment

Suggested Readings

Principles of Incident Response and Disaster Recovery, Whitman & Mattord, Course Technology

ISBN: 141883663X

(Web link) http://www.cnss.gov/Assets/pdf/nstissi_4011.pdf

CO 2	M	H	M	M		
CO 3		M	H	M	L	
CO 4			M	H	M	
CO 5			L	M	H	M
CO 6				L	M	H

CSCD0120: SECURE CODING (3 Credits)

Course Outcomes

Recall the basics of secure programming. (Remembering)

Explain the most frequent programming errors leading to software vulnerabilities. (Understanding)

Identify security problems in software. (Applying)

Compare the solutions for handling security problems in software. (Analysing)

Assess the vulnerabilities present in software. (Evaluating)

Design and develop secure programs. (Creating)

Module 1 (10 Hours)

Introduction to software security, managing software security risk, selecting software development Technologies, An open source and closed source, Guiding Principles for software security, Auditing software, Buffer overflows, Access control, Race conditions, Input validation, Password authentication

Module 2 (6 Hours)

Anti-tampering, Protecting against denial of service attack, Copy protection schemes, Client-side security, Database security, applied cryptography, Randomness and determinism

Module 3 (8 Hours)

Buffer Overrun, Format String Problems, Integer Overflow, and Software Security Fundamentals SQL Injection, Command Injection, Failure to Handle Errors, and Security Touch points

Module 4 (8 Hours)

Cross Site Scripting, Magic URLs, Weak Passwords, Failing to Protect Data, Weak random numbers, improper use of cryptography

Module 5 (8 Hours)

Information Leakage, Race Conditions, Poor usability, Failing to protect network traffic, improper use of PKI, trusting network name resolution

Module 6 (5 Hours)

Case study of Cross Site Scripting, Magic URLs, Weak Passwords Buffer Overflows, Access control, Race conditions

Suggested Readings

J. Viega, M. Messier. Secure Programming Cookbook, O'Reilly.
 M. Howard, D. LeBlanc. Writing Secure Code, Microsoft
 J. Viega, G. McGraw. Building Secure Software, Addison Wesley

CSBI0121: BIOMETRICS
(3 Credits)
Course Outcomes

Define biometrics. (Remembering)
 Explain the various modules constituting a biometric system. (Understanding)
 Identify Biometric System Vulnerabilities. (Applying)
 Compare the various Biometric technologies. (Analysing)
 Evaluate the challenges and limitations associated with biometrics. (Evaluating)
 Design security systems incorporating biometrics. (Creating)

Module 1 (7 Hours)

Introduction and Definitions of biometrics, Traditional authenticated methods and technologies.

Module 2 (10 Hours)

Biometric technologies: Fingerprint, Face, Iris, Hand Geometry, Gait Recognition, Ear, Voice, Palm print, On-Line Signature Verification, 3D Face Recognition, Dental Identification and DNA.

Module 3 (6 Hours)

The Law and the use of multi biometrics systems.

Module 4 (11 Hours)

Statistical measurement of Biometric. Biometrics in Government Sector and Commercial Sector.

Module 5 (9 Hours)

Case Studies of biometric system, Biometric Transaction. Biometric System Vulnerabilities.

Module 6 (5 Hours)

Recent trends in Biometric technologies and applications in various domains. Case study of 3D face recognition and DNA matching.

Suggested Readings

1. Biometrics for network security, Paul Reid, Hand book of Pearson
2. D. Maltoni, D. Maio, A. K. Jain, and S. Prabhakar, Handbook of Fingerprint Recognition, Springer Verlag, 2003.

CSAA6078: ADVANCED ALGORITHM LAB (3 Credits)

Course Outcomes

Recall and explain the fundamentals of design and analysis of basic data structures and experiment with the implementation process. (Remembering, Understanding, Applying)

Examine and evaluate the concepts in the specification and analysis of programs. (Analysing, Evaluating)

Elaborate the principles for good program design, especially the uses of data abstraction. (Creating)

Module 1:

1. Program to find Breadth First Search of a graph.
2. Program to find Depth First Search of a graph.
3. Program to find strongly connected components of a graph.
4. Implement Prim's algorithm to find a minimal spanning tree of a graph.
5. Implement Kruskal's algorithm to find a minimal spanning tree of a graph.
6. Implement Dijkstra's algorithm to find the shortest path in a graph.

Module 2:

7. Implementation of algorithms to compute a maximum weight maximal independent set.
8. Implementation of graph matching algorithms.
9. Implementation of Ford-Fulkerson Method to compute maximum flow.
10. Implementation of Edmond-Karp maximum-flow algorithm.

Module 3:

11. Implement Strassen's Algorithm.
12. Implement Floyd Warshall Algorithm.

Mapping of COs to Syllabus:

	Module 1	Module 2	Module 3
CO 1	H	M	
CO 2	M	H	M
CO 3		M	H

CSEN6080: DATA ENCRYPTION AND COMPRESSION LAB (3 Credits)

Course Outcomes

Recall the different encryption techniques adopted in both traditional and modern cryptographic mechanisms. (Remembering)

Interpret cryptographic algorithms, and their countermeasures. (Understanding)

Apply fundamental cryptographic approaches in solving related problems. (Applying)

Analyse the working of the different encryption and compression algorithms. (Analysing)

Compare and contrast the working of different data encryption and compression mechanisms. (Evaluating)

Choose appropriate encryption and compression algorithms to build real-world systems. (Creating)

Module 1:

1. Implementation of run length encoding
2. Implementation of Lempel-Ziv coding

Module 2:

3. Implementation of Huffman Encoding of a sequence
4. Implementation of Huffman Decoding of a compressed bit sequence.

Module 3:

5. Implementation of RC4 algorithm.

6. Implementation of S-DES algorithm for data encryption

Module 4:

7. Implementation of RSA Algorithm

Module 5:

8. Implementation of SHA

9. Implementation of MD5

Module 6:

10. Implementation of JPEG algorithm.

CSBA0142 BUSINESS ANALYTICS

(3 Credits)

Course Outcomes

Recall the scope of business analytics (Remembering)

Interpret the modeling relationships and trends in data, simple linear regression. (Understanding)

Experiment with knowledge of data analytics (Applying)

Analyze critically in making decisions based on data and deep analytics. (Analysis)

Asses technical skills in predictive and prescriptive modeling to support business decision-making. (Evaluating)

Adapt the ability to translate data into clear, actionable insights.(Creating)

Syllabus

Module 1 (8 hours)

Business analytics: Overview of Business analytics, Scope of Business analytics, Business Analytics Process, Relationship of Business Analytics Process and organisation, competitive advantages of Business Analytics. Statistical Tools: Statistical Notation, Descriptive Statistical methods, Review of probability distribution and data modelling, sampling and estimation methods overview.

Module 2 (8 hours)

Trendiness and Regression Analysis: Modelling Relationships and Trends in Data, simple Linear Regression. Important Resources, Business Analytics Personnel, Data and models for Business analytics, problem solving, Visualizing and Exploring Data, Business Analytics Technology.

Module 3 (8 hours)

Organization Structures of Business analytics, Team management, Management Issues, Designing Information Policy, Outsourcing, Ensuring Data Quality, Measuring contribution of Business analytics, Managing Changes. Descriptive Analytics, predictive analytics, predictive Modeling, Predictive analytics analysis, Data Mining, Data Mining Methodologies, Prescriptive analytics and its step in the business analytics Process, Prescriptive Modeling, nonlinear Optimization.

Module 4 (9 hours)

Forecasting Techniques: Qualitative and Judgmental Forecasting, Statistical Forecasting Models, Forecasting Models for Stationary Time Series, Forecasting Models for Time Series with a Linear Trend, Forecasting Time Series with Seasonality, Regression Forecasting with Casual Variables, Selecting Appropriate Forecasting Models.

Monte Carlo Simulation and Risk Analysis: Monte Carlo Simulation Using Analytic Solver Platform, New-Product Development Model, Newsvendor Model, Overbooking Model, Cash Budget Model.

Module 5 (8 hours)

Decision Analysis: Formulating Decision Problems, Decision Strategies with the without Outcome Probabilities, Decision Trees, the Value of Information, Utility and Decision Making.

Module 6 (4 hours)

Recent Trends in: Embedded and collaborative business intelligence, Visual data recovery, Data Story-telling and Data journalism.

Suggested Readings

Business analytics Principles, Concepts, and Applications by Marc J. Schniederjans, Dara G. Schniederjans, Christopher M. Starkey, Pearson FT Press.

Business Analytics by James Evans, persons Education.

CSDM0139 DATA WAREHOUSING & MINING

(3 Credits)

Course Outcomes

Illustrate different classification, prediction, sequential pattern algorithms (remembering and Understanding)

Construct cluster, periodicity and social network analysis.(Applying)

Analyze technique to extract patterns from time series data and its application in real world (Analysing)

Apprise the Graph mining algorithms to Web mining (Evaluating)

Design computing framework for Big Data (Creating)

Syllabus**Module 1 (12 hours)**

Introduction to Data Warehousing; Data Mining: Mining frequent patterns, association and correlations; Sequential Pattern Mining concepts, primitives, scalable methods; Classification and prediction; Cluster Analysis – Types of Data in Cluster Analysis, Partitioning methods, Hierarchical Methods; Transactional Patterns and other temporal based frequent patterns.

Module 2 (15 hours)

Mining Time series Data, Periodicity Analysis for time related sequence data, Trend analysis, Similarity search in Time-series analysis; Mining Data Streams, Methodologies for stream data processing and stream data systems, Frequent pattern mining in stream data, Sequential Pattern Mining in Data Streams, Classification of dynamic data streams, Class Imbalance Problem; Graph Mining; Social Network Analysis;

Module 3 (12 hours)

Web Mining, Mining the web page layout structure, mining web link structure, mining multimedia data on the web, Automatic classification of web documents and web usage mining; Distributed Data Mining.

Module 4 (6 hours)

Recent trends in Distributed Warehousing and Data Mining, Class Imbalance Problem; Graph Mining; Social Network Analysis

Suggested Readings

Jiawei Han and M Kamber, Data Mining Concepts and Techniques,, Second Edition, Elsevier Publication, 2011.

Vipin Kumar, Introduction to Data Mining - Pang-Ning Tan, Michael Steinbach, Addison Wesley, 2006.

G Dong and J Pei, Sequence Data Mining, Springer, 2007

CSWI0140 WEB SEARCH & INFORMATION RETRIEVAL**Course Outcomes**

Recall basic theories and analysis tools as they apply to information retrieval. (Remembering and Understanding)

Apply the understanding of problems and potentials of current IR systems. (Applying)

Analyze different retrieval algorithms and systems. (Analysing)

Evaluate various indexing, matching, organizing, and evaluating methods to IR problems. (Evaluating)

Formulate various theoretical IR research. (Creating)

Syllabus**Module 1 (15 hours)**

Information retrieval model, Information retrieval evaluation, Searching the Web, Document Representation, Query languages and query operation, Meta-datasearch.

Module 2 (15 hours)

Indexing and searching, Scoring and ranking feature vectors, Ontology, domain specific search, parallel and distributed information retrieval.

Module 3 (10 hours)

Text and multimedia languages, Social networks.

Module 4 (5 hours)

Recent trends in Web search and Information retrieval techniques.

Suggested Readings

C. D. Manning, P. Raghavan and H. Schütze, Introduction to Information Retrieval, Cambridge University Press, 2008 (available at <http://nlp.stanford.edu/IR-book/>).

Chakrabarti, S. (2002). Mining the web: Mining the Web: Discovering knowledge from hypertext data. Morgan-kaufman.

B. Croft, D. Metzler, T. Strohman, Search Engines: Information Retrieval in Practice, AddisonWesley, 2009 (available at <http://ciir.cs.umass.edu/irbook/>).

R. Baeza-Yates, B. Ribeiro-Neto, Modern Information Retrieval, Addison-Wesley, 2011 (2ndEdition).

CSDY0141: DATABASE SECURITY AND ACCESS CONTROL

(3 Credits)

Course Outcomes

Summarize the access control and implement classical models and algorithms. (Remembering and Understanding)

Identify the capabilities and limitations of various access control mechanisms. (Applying)

Analyze the data, identify the problems, and choose the relevant models and algorithms to apply.

(Analysing)

Assess the strengths and weaknesses of various access control models and to analyze their behaviour.

(Evaluating)

Design and develop access control mechanisms for enterprise IT infrastructures.(Creating)

Syllabus

Module 1 (15 hours)

Introduction to Access Control, Purpose and fundamentals of access control, brief history, Policies of Access Control, Models of Access Control, and Mechanisms, Discretionary Access Control (DAC), Non-Discretionary Access Control, Mandatory Access Control (MAC). Capabilities and Limitations of Access Control Mechanisms: Access Control List (ACL) and Limitations, Capability List and Limitations,

Module 2 (15 hours)

Role-Based Access Control (RBAC) and Limitations, Core RBAC, Hierarchical RBAC, Statically Constrained RBAC, Dynamically Constrained RBAC, Limitations of RBAC. Comparing RBAC to DAC and MAC Access control policy, Biba Integrity model, Clark-Wilson model, Domain type enforcement model, mapping the enterprise view to the system view, Role hierarchies- inheritance schemes, hierarchy structures and inheritance forms, using SoD in real system, Temporal Constraints in RBAC, MAC AND DAC. Integrating RBAC with enterprise IT infrastructures: RBAC for WFMSs, RBAC for UNIX and JAVA environments Case study: Multi line Insurance Company.

Module 3 (10 hours)

Smart Card based Information Security, Smart card operating system, fundamentals, design and implementation principles, memory organization, smartcard files, file management, atomic operation, smart card data transmission, ATR, PPS Security techniques- user identification, smart card security, quality, assurance and testing, smart card life cycle-5 phases, smart card terminals.

Module 4 (5 hours)

Recent trends in Database security and access control mechanisms. Case study of Role-Based Access Control (RBAC) systems.

Suggested Readings

Role Based Access Control: David F. Ferraiolo, D. Richard Kuhn, Ramaswamy Chandramouli.

<http://www.smartcard.co.uk/tutorials/sct-itsc.pdf> : Smart Card Tutorial.

CSDI6092: DISSERTATION- I / INDUSTRIAL PROJECT

(10 Credits)

Course Outcomes

Recall the enhanced research areas which can be undertaken (Remembering).

Illustrate the research gap within the topic that he / she undertakes (Understanding).

Apply algorithm to solve the problem stated (Applying).

Analyse and categorize the data to be collected to carry on with the research

(Analysis).

To evaluate the outcome which is expected from the research (Evaluating).
Create and implement the methodology to have an outcome (Creation).

CSDI6093:DISSERTATION II

(16 Credits)

Course Outcomes

Recall and relate desertation phase I to identify the basic problem specific outcome (Remembering).
Illustrate the research gap within the topic that he / she undertakes (Understanding).
Make use of the algorithm implemented in Phase I for accuracy (Application).
Compare the results with the existing system to identify its accuracy (Analysis).
Evaluate and summarize the outcome which is expected from the research (Evaluating).
creating an outcome based on the methodology implemented (Creation).

DEPARTMENT OF CIVIL ENGINEERING
M Tech in Civil Engineering

VISION

To be a recognized leader in Civil Engineering education and learning experiences providing state of the art education guided by innovative research and consultancy, inclusive technology and managerial skills for industry as well as societal needs towards sustainable development.

MISSION

To make the department a center of excellence in Civil Engineering education which equips students with a strong conceptual foundation coupled with practical insight to meet the global industrial and environmental challenges.

To produce spiritually inspired socially committed and intellectually competent professionals of high caliber and strong ethical principles to serve the society and nation through teamwork and societal leadership.

To establish the department as a recognized center of research for developing sustainable solutions to engineering problems by providing knowledge base and consultancy services to the community.

Programme outcomes

PO1. An ability to conduct field and laboratory experiments and interpret data in construction industry.

PO2. An ability to design a system to meet desired needs within realistic constraints such as economic, environmental, social, safety and sustainability in construction industry

PO3. An ability to use the techniques, skills and modern engineering tools

PO4. An understanding of professional and ethical responsibility while working in construction industry

PO5. an ability to engage in life-long learning to update the knowledge in construction materials and management

Programme Specific Outcomes

Exhibit detailed professional knowledge in core sub-specializations of civil engineering including structural engineering, geotechnical engineering, hydraulic and environmental engineering and transportation engineering.

Demonstrate analytical and design skills using various technical supports.

Display the ability to tackle research projects and development works in various field of civil engineering using analytical, computational and experimental techniques.

Ability to integrate the knowledge gained from the various core and elective courses for collaborative and multi-disciplinary solutions of different civil engineering challenges.

Detail Syllabus
M Tech In Civil Engineering

Core courses

Core 1: CVSA0108 : ADVANCED STRUCTURAL ANALYSIS (L-T-P: 3-1-0)

(4 Credit- 60 hours)

Objectives:

The main objective of the course is to equip students with an advanced understanding of structural analysis techniques and their practical application in solving complex engineering problems. This course will develop the analytical skills of students, to tackle real-world structural engineering challenges effectively.

Course/Learning Outcomes:

At the end of the course, students will be able to:

CO1: Identify the physical significance of coefficients on structural behavior using various approaches.

(Understanding)

CO2: Design large structural systems using Matrix analysis and advanced computational methods. (Create)

CO3: Examine the linear and nonlinear structures to ensure structural integrity under various conditions. (Analyze)

CO4: Develop the boundary values using approximate methods. (Create)

CO5: Evaluate the effectiveness of plastic analysis methods in predicting structural behavior. (Evaluate)

Syllabus:

Module I: (13 hours)

Influence Coefficients: Physical significance, effects of settlements, temperature change and lack of fit, member approach and structure approach.

Applications to Simple Problems: Beams, plane trusses, plane rigid jointed frames and grids by structure approach and member approach.

Module II: (22 hours)

Matrix Method (Flexibility Method and Stiffness Method) of Analysis: Local coordinates and global coordinates, boundary conditions, solution of matrix equations and calculation of reactions and member forces, Introduction to finite element method.

Module III: (13 hours)

Boundary Value Problems (BVP): Approximate solution of boundary value problems, modified Galerkin method for 1-D BVP, Matrix formulation of the modified Galerkin method.

Plastic Analysis: Incremental plastic analysis, formation of plastic hinges.

Module IV: (12 hours)

Linear Element: Shape functions, solution for Poisson's equation, general One Dimensional equilibrium problem.

Non-Linear Element: Consideration of geometric and material nonlinearity in direct stiffness method, P-delta effects.

CVPW0109: Physico- chemical treatment of water and waste water**4 Credits [4-0-0]**

Course Objectives: The goal is to provide a theoretical understanding of various chemical and physical unit operations, with direct application of these operations to the design and operation of water and wastewater treatment systems. Students will use the concepts learned in this class to better understand the design and operation of engineered and natural aquatic systems.

Course Outcomes:

On successful Completion of the course , students will be able to:

CO1: Assess and analyze the quality of water and wastewater by examining impurities, characteristics, and conducting various tests to ensure compliance with potable water standards.(Analyse)

CO2: Apply principles of unit operations and processes to design and operate the systems effectively(Create)

CO3: Utilize process techniques to enhance water and wastewater treatment and sludge treatment and understand mechanisms of treatment processes to , manage select suitable treatment system to execute different processes for treating and disinfecting water and wastewater and the sludge , ensuring compliance with quality standards(Analyse)

CO4: Assess the quantity of water and wastewater, understand the spectrum of particulate size distribution, and manage variation of flows to design efficient water and wastewater systems. (Evaluate)

Module I: 10 Hours

Quality of water and wastewater, Wholesome water, Impurity of water, Characteristics of water, Examination of water, Standards of potable water quality, Characteristics of sewage, Examination of sewage, Standards of quality of treated water and wastewater, Quantity of water and waste water, Waste water and gas flow, Water requirement for domestic and industrial purposes, Waste water formation and estimation, Spectrum of particulate size distribution, Variation of flows.

Module II: 5 Hours

Purpose of screenings and terms: blinding, stratification, contamination, gradation, grading, Flow equalization, Types of bar racks and screens, Disposal of screenings, Removal of oil, grease etc. Floatation Skimming tank, Disposal of skimming.

Module III: 15 Hours

SEDIMENTATION - Principles of Sedimentation and Stokes' law applied to fluids, Characteristics of the settleable solids, Classification of sedimentation tanks for water and waste water, Factors influencing sedimentation, Deciding size of sedimentation tank for water and wastewater, Standard design loading, Detention period.

Coagulation – purpose, principle, Types of coagulants and its suitability, Determination of optimum coagulation dose, Feeding of coagulant and feeding devices, Flocculation and flocculation tanks and design criteria of flocculator, Clarifiers, its types and design criteria, Settling efficiency of particles. Grit removal

Module IV: 5 Hours

Theory of filtration- Mechanism for particle size, Hydraulics of filters, Types of filters and their flow direction, Filter clogging, Filter washing, Break through, Deciding size of filter unit, Advances in filtration

Module V: 15 Hours

Chemical precipitation, Water and wastewater softening, Estimation of dose of chemical, Methods of softening - ammonia, borax, lye, lime-soda, chelating, Ion exchange method etc., Methods of removal of dissolved solids - solar distillation gadgets and plants, direct freezing, reverse osmosis, electrolysis, Methods of disinfection - chlorination – chlorine dose, chlorine demand, application of chlorine, Use of various forms of chlorine, break through chlorination, Removal of colour

Module VI: 10 Hours

Sources of sludge- Estimation of bulk density of sludge, Estimation of rate of filtration. Principles of dewatering, Methods of dewatering and suitability, Thickening of sludge, Chemical conditioning, Elutriation of sludge, Vacuum and pressure filtration, Sludge lagging

VI					H	

Core III: CVAF0110: Advanced Foundation Engineering

4 credits-60 Hours (L:T:P:4:0:0)

Course Objective:

The students will be able to decide the type of foundations to be recommended for construction of different engineering structures

The students will be able to design different types of foundations

Course Outcomes:

CO1: Identify a suitable foundation system for a structure, methods of soil exploration, (understand)

CO2: Calculate Lateral earth pressure and retaining wall, Bearing capacity and settlement of shallow foundation, Analyse and design shallow foundations, and pile foundations.(Evaluate, Apply)

CO3: Evaluate the importance of raft foundation, analyse and design of well foundation.(Analyse , Apply)

CO4: Examine and discuss various machine foundations, Analyse and design Sheet piles and coffer-dams, foundation on problematic soil. (Create)

Module 1: [10 hour]

Introduction: Foundation Engineering, Importance and Purpose, Classification and general requirement, Factors influencing the choice of a foundation, Selection of the type

Soil Exploration Introduction, Methods of exploration, Planning the exploration programme, Method of boring, Soil sampling and soil samplers, Vertical and lateral extent of borings, Field tests like Penetration test (Standard Penetration Test, Static Cone Penetration Test, Dynamic Cone Penetration Test) Pressure meter tests, dilatometer test and field Vane shear test. Groundwater observations, Borehole logs, Site investigation reports

Module II: [15 Hours]

Lateral Earth Pressure Theories and Retaining Walls [10 Hours]: Introduction, Effect of wall movement on Earth pressure, Earth pressure at Rest, Classical Earth Pressure Theories, Rankine's theory, Coulomb's theory, Yielding of wall of limited height, Graphical solution for coulomb's earth pressure, Trial wedge method for earth pressure, proportioning of retaining walls, Stability of retaining walls

Flexible Retaining Structures and Cofferdams [3 Hours]: Introduction, Cantilever sheet pile wall, Anchored wall, Cofferdams

Module V:[10 Hours]

Bearing Capacity and Settlement of Shallow Foundations [6 Hours]: Introduction, Basic Definitions and their relationship, Principle modes of soil failure, Bearing capacity by classical Earth pressure theory of Rankine, Pauker and Bell's bearing capacity theory of failure, Prandtl's theory of failure, Terzaghi's method of determining bearing capacity of soil, Effect of water table on bearing capacity, Extension of Terzaghi's bearing capacity theory, Recent bearing capacity theories, Bearing capacity from In-situ tests (Plate load test), Types of settlement and their relationships. Allowable settlement and allowable bearing pressure, Steps involved in the proportion of footings. Design of shallow Foundation

Module VI:[8 Hours]

Mat Foundations [4 Hours]: Introduction, Common types of mat foundation, bearing capacity and settlement of mat foundations Compensated foundation, Analysis of mat foundation.

Beams on Elastic Foundation

Module VII:[7 Hours]

Pile Foundations [6 Hours]: Introduction, Types and uses of piles, Construction of piles, Selection of pile type, Types of foundations to suit subsoil conditions, Pile driving formula, Static pile load formulae, Load test on piles, Dynamics pile formulae, Pile capacity from in-situ tests. Group action of piles, Negative skin friction, laterally load piles, Piles subjected to uplift loads, Uplift capacity of piles, foundations/anchors under uplift loads, well foundation

Module VIII: [10 Hours]

Well Foundations : Introduction, Types of wells or caissons, Components of a well foundation, Shapes of wells, Depth of a well foundation, Forces acting on well foundation, Lateral stability of well foundation, Construction and sinking of a well.

Foundations on problematic soils: Foundations for collapsible and expansive soil. : IS and IRC codal provisions, elastic theory and ultimate resistance methods for well foundations, foundations on problematic soils: foundations for collapsible and expansive soil.

Suggested Readings:

Core IV**CVAH0111: ADVANCED HYDROLOGY**

4 Credits-3L: 1 T: 0P

COURSE OBJECTIVES: *The objective of this course is to provide students with an advanced understanding of the analysis and development of the basic tools for analysis of hydrologic processes, apply time series models for hydrologic data generation and forecasting, estimate the design flows and assess impact of climate change and Land use/Land cover on water availability.*

COURSE OUTCOME: At the end of the course, students will be able to ,

CO1: Understand the hydrologic systems and hydrologic inputs(Understand)

CO2. Analyse the hydrologic abstractions, streamflow measurement and Unit hydrographs(Analyse)

CO3. Analyse and solve problems on Linear and Nonlinear models, Physically based models and hydrological routing.(Apply)

CO4. Analyse and solve problems on frequency analysis, time series analysis, impact of climate change- and Land use/Land cover on basin response.(Evaluate)

Detailed Syllabus**Module I: (15 hours)**

Introduction to hydrologic system and hydrologic budget, fundamental laws of hydrology; atmospheric water vapor, introduction to hydrologic Inputs like precipitation and its forms, snowfall and rainfall; measurement techniques and space-time characteristics.

Module II: (15 hours)

Introduction to Hydrologic Abstractions like infiltration, depression storage, evapotranspiration and its measurement techniques, space time characteristics and their modeling, introduction to stream flow measurement techniques, space-time characteristics, rating curves, introduction to Unit Hydrograph IUH, GIUH.

Module III: (15 hours) :

Mathematical Modelling using Linear and Nonlinear models, physically based models, hydrological routing, flood forecasting.

Module IV: (15 hours)

Advanced method of frequency analysis, outliers, time series analysis, study the impact of climate change and Land use/Land cover on basin response.

Professional Elective Courses**Professional Elective 1****1.CVHS0112:Hydraulic Structures-3 Credits-3L: 0 T: 0P**

COURSE OBJECTIVES: *The objective of this course is to provide students with an advanced understanding of the analysis and design of various types of hydraulic structures.*

COURSE OUTCOME

CO1: Understand the hydraulic structures for water resources projects(Understand)

CO2: Analyse the construction and design principles of embankment and gravity dam(Analyse)

CO3: Analyse and solve problems on dam outlet works and terminal structures(Apply)

CO4: Analyse and solve problems on dimensional analysis and design of physical models of hydraulic structures(Apply)

Syllabus

Module I: Introduction: Hydraulic structures for water resources projects. (10 hours)

Module II: Introduction to embankment dams, its types, design considerations, seepage analysis and control, stability analysis, construction techniques, introduction to gravity dam, forces acting on and failure of a gravity dam, stress analysis, elementary profile, design of gravity dam, other functional features of a gravity dam. (15 hours)

Module III: Introduction to dam outlet works, types of outlet structures, ogee spillway, chute spillway, siphon spillway, side channel spillway, labyrinth and piano key weir, introduction to terminal structure, hydraulic jump types, stilling basin, roller bucket, ski jump basin, baffled spillway, drop structure. (10 hours)

Module IV: Introduction to hydraulic modeling and its basic principles, dimensional analysis, design of physical models of hydraulic structures. (10 hours)

2.CVAP0113: Air Pollution and control

(3 credits) (L: T:P: 3-0-0)

Objective:

The objective of the course is to provide the understanding of causes and effects of air pollution and their controlling mechanisms. The course also imparts knowledge on the impacts of air pollution on policy, human health and various contemporary technological innovation for betterment of air quality.

Course outcomes:

After Successful completion of this course, the student should be able to:

CO1. Identify several types of air pollution problems and the chemistry and physics affecting them (Understand)

CO2. Discuss (physical, chemical, biological, and social) mechanisms leading to impacts of air pollution on human health, welfare, and the environment. (Understand)

CO3. Discuss air pollution management practices (regulations, strategies, technologies). (Apply)

CO4. Analyze (quantitatively and qualitatively) impacts of air pollution management decisions on air quality, human health, and the environment. (Analyse)

CO5. Select methods for measurement, control, and prevention of air pollution. (Apply)

Detailed syllabus**Module I:[10 Hours]**

Air Pollution: Introduction and Impacts of air pollution on human health, vegetation, animals, building materials, structures, and atmosphere, soil and water bodies. Sources, classification and formation/transformation of air pollutants:

Indoor air pollution: sources, types and health impacts. Sampling, assessment and evaluation of Indoor air quality.

Module II:[15 Hours]

Meteorology and Atmospheric Stability. Lapse Rate, Plume Behaviour, and Air Quality Monitoring, Air Quality Index (AQI); Air Quality Modelling, Gaussian dispersion models: point, line and area source models;

Emissions Inventory: Transport, Industrial, Agricultural, Residential and Commercial sectors.

Global and regional environmental issues of air pollution: Ozone depletion, Climate change, Global warming, Acid rain.

Module III:[8 Hours]

Air pollution control devices, equipment and their design.

Module IV : [7 Hours]

Air pollution emission standards, National and international policies, acts, rules and regulations.

Emerging technologies and strategies to mitigate air pollution, Current challenges and way forward.

Module V :[5 Hours]

Lab-based measurements of air pollutants.

3. CVTV0114:Theory of Vibration (3-0-0)**Course Objectives**

The course deals with the dynamic analysis of structures and applications in design. The main objectives are listed below:

To understand and apply the method to develop dynamic equation of motions

To know the method to find out the response time history of structure subjected to different types of excitations.

To be familiar with the analysis of single degree freedom, multi degree freedom and continuous system

To know the numerical techniques to solve the problems in structural dynamics

Course Outcomes

After successful completion of the course , students will be able to:

CO1: Familiarize with the formulation of problems for dynamic analysis (Understand)

CO2: Develop equations of motions for SDF system and different approaches for solution (Apply)

CO3: Find the response of MDF and continuous systems using modal analysis(Evaluate)

CO4: Familiar with different numerical methods to find out the dynamic response of a system (Understand)

Module I Introduction (4 hours)

Importance of vibration analysis, effects of vibration, Nature of excitation, deterministic and random excitation, vibration terminology, Degrees of freedom, Mathematical modelling of dynamic system, initial value and boundary value problems, Types of vibration-Free and forced vibration, Characteristics of discrete systems.

Module II Single Degree Freedom system (12 hours)

Equation of motion, energy method, natural frequency of SDF, viscous damping, damped and undamped oscillation, free vibration response, underdamped, critically damped and overdamped system, logarithmic decrement. Forced vibration, response to harmonic excitation, support motion, vibration isolation, vibration measuring instruments, response to arbitrary excitation, Duhamel integral, concept of response spectra.

Module III Multidegree freedom system (8 hours)

Two degrees of freedom system, natural frequencies and normal modes, forced vibration of multi degree freedom system, mode superposition technique, orthogonality condition of normal modes, modelling of multistoried buildings, response of shear building to base excitation, Rayleigh's approximate method, state-space solution,

Module IV: Numerical approach in Structural Dynamics (8 hours)

Numerical solutions of Duhamel integral, numerical Solution to Response using Newmark Method and Wilson Method, Numerical Solution for State Space Response using Direct Integration,

Module V: Continuous system (8 hours)

Relation between discrete and continuous system, Axial vibration of rods, Bending vibrations of beams, boundary conditions and eigen value problems, mode shape functions and natural frequencies, orthogonality of mode shape functions, modal analysis.

Module VI: Special topics in Structural Dynamics (5 hours)

Moving Loads, Vibrations caused by Traffic, Blasting and Pile Driving, Foundations of industrial machines, wave propagation

Suggested Readings

4. Geo textile in Civil Engineering (3-0-0=3)

Course objectives

The course is framed for Master Degree students with the following objects

Understand different types of geotextiles

Design of geotextiles for various geotechnical challenge

Understand the usage of geotextiles in pavement construction, slope stability and drainage

Course Outcomes

CO1: Understand different types of geotextiles(Understand)

CO2: Summerise the properties and tests for geotextiles(Understand)

CO3: Design of reinforced soil earthen wall(Create)

CO4: Application to different Civil Engineering problems(Apply)

Module I Introduction (4 hours)

Introduction to Geotextiles, historical background, functions, reinforced earth-mechanism and concepts

Module II Types of geotextiles (6 hours)

Classification of geotextiles, woven, nonwoven and combined, natural fibres, manufacturing process

Module III Properties of geotextiles (10 hours)

Tensile strength, impact strength, resistance to stress induced crack, heat resistance and hydraulic properties, laboratory tests, quality control and assurance, sustainability aspects of using geotextiles.

Module IV Geogrid Reinforced Soil wall (10 hours)

Geo-grid reinforced soil wall, guide lines for design of reinforced slopes, geotextiles in road construction, controlling soil erosion, backfill pressure in bridge abutment

Module V Slope Stability (9 hours)

Slope stability analysis-finite and infinite slopes, in-situ slope stabilization, design of reinforced slope, embankments on soft soil

Module VI Drainage facility (6 hours)

Drainage facility improvement using geo synthetics, accelerated consolidation of soft clays using geosynthetics, geotextile tubes for dewatering and decontamination of soil.

Suggested readings:

Professional Elective II**1. CVIT0116: GROUND IMPROVEMENT TECHNIQUES****3 credits - (L-T-P: 3-0-0)**

Objectives: This course aims to provide students with a comprehensive understanding of ground improvement techniques and their applications to various soil conditions and construction requirements. It covers mechanical, hydraulic, chemical and thermal modification methods as well as soil reinforcement with geosynthetics and promotes the ability to design and analyze stable and efficient reinforced soil structures.

COURSE / LEARNING OUTCOMES

CO1: Understand the need and different situations requiring ground improvement.

CO2: Explain and apply various mechanical and hydraulic modification techniques for ground improvement.(Understand)

CO3: Demonstrate knowledge of chemical modification techniques and their application.(Apply)

CO4: Understand and apply thermal modification techniques for ground improvement.(Understand)

CO5: Analyze and select appropriate soil reinforcement techniques for different scenarios.(Analyse)

CO6: Design and analyze structures using soil reinforcement techniques.(Create)

Syllabus Contents:

Unit I: Introduction: Need for Ground Improvement, Different types of problematic soils, Emerging trends in ground Improvement.

Unit II: Mechanical modification: Dynamic compaction, impact loading, compaction by blasting, vibro-compaction; pre-compression, stone columns; Hydraulic modification: dewatering systems, preloading and vertical drains, electro-kinetic dewatering

Unit III: Chemical modification: Modification by admixtures, stabilization using industrial wastes, grouting

Unit IV: Thermal modification: Ground freezing and thawing.

Unit V: Soil reinforcement: Reinforced earth, basic mechanism, type of reinforcements, selection of stabilisation/improvement of ground using Geotextiles, Goegrid, geomembranes, geocells, geonets, and soil nails.

Unit VI: Application of soil reinforcement: Shallow foundations on reinforced earth, design of reinforced earth retaining walls, reinforced earth embankments structures, wall with reinforced backfill, analysis and design of shallow foundations on reinforced earth, road designs with geosynthetics.

Suggested Readings

2. CVRD0117: Earthquake Resistant Design of Structures (3-0-0)

Course Objectives

The course deals with the principles of earthquake resistant design of structures, measures to be taken to identify seismically deficient buildings and to improve their resistance. The main objectives are listed below:

To understand the effects of earthquakes on structures

To carry out lateral load analysis with reference to Indian standard codes

To be familiar with earthquake resistant design of buildings

To know the methods for improving earthquake resistance of buildings

Course Outcome

After successful completion of the course, students will be able to,

CO1: Familiarization with the damaging effects of earthquakes on different types of buildings ?

(Understand)

CO2: Mode the structures to find dynamic characteristics needed to find seismic forces (Apply)

CO3: Estimate seismic forces on buildings using guidelines of Indian Standard codes(evaluate)

CO4: Understanding earthquake resistant design philosophy, design procedure and to improve earthquake resistance of the buildings.(Understand ,Apply)

Module I: Effect of earthquake on structures (6 hours)

Earthquake and its consequences, force generation mechanics, factors affecting structural damage, seismic waves, intensity, magnitude and energy of an earthquake, measurement of ground motions, prominent past earthquakes.

Module II: Modelling of structure for seismic analysis (9 hours)

Basics of structural dynamics, SDF and MDF systems in modelling of structures for dynamic load, Time periods and modes of oscillation, resonance condition, role of damping, base excitation in structure, vibration transmission and isolation, concept of response spectrum.

Module III: Estimation of seismic forces in buildings (10 hours)

Philosophy of earthquake resistant design, lessons learnt from past earthquakes, seismic codes and guidelines, Seismic load calculation as per IS 1893- 2016, Seismic zones in India, Equivalent static approach, Dynamic analysis methods modal participation factors, combination of modes, unsymmetrical configuration of buildings and torsion.

Module IV: Earthquake resistant design of RC building (8 hours)

Earthquake resistant measures at planning stage, architectural features, horizontal and vertical layout of buildings, provisions of IS 4326-1993, Reinforced concrete framed buildings, capacity based design, beam-column joint in moment resistant frame, ductile detailing, provisions of IS 13920-13.

Module V: Earthquake resistant design of Masonry Buildings (6 hours)

Earthquake resistant design of masonry structures, stresses in brick wall due to lateral load, damaging effect of earthquakes and earthquake resistant features of masonry load bearing structures, seismic bands, improving earthquake resistance of low strength brick wall, provisions of IS 13828-1993.

Module VI: Geotechnical consideration and vulnerability studies (6 hours)

Geotechnical consideration in design of structures, liquefaction and its effects, measures to reduce liquefaction potential, vulnerability atlas of India, assessment of seismic vulnerability of buildings, retrofitting and rehabilitation of structures.

Suggested Readings:

3. CVID0118: IRRIGATION AND DRAINAGE (3 credits) (L-T-P:3-0-0)

Objective:

To take up the basic concepts of irrigation and basic concepts of water, plants, and their interactions, as well as irrigation and drainage systems design. The structures involved the elementary hydraulic design of different structures and the concepts of maintenance shall also form part. To develop analytical skills relevant to the areas mentioned above, particularly the design of irrigation and drainage projects.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

Explain the objectives, types, and suitability of different irrigation methods, along with the concepts of soil-water relationships, crop evaporative needs, and irrigation efficiency.(Understand)

Apply various surface irrigation techniques and employ field measurement techniques for flow measurement.(Apply)

Design irrigation systems and evaluate drainage needs.(create)

Module I: (10 Hours)

Introduction, objectives of irrigation, type of irrigation and suitability; selection of irrigation method. Irrigation requirement, water balance, soil water relationships, water storage zone, infiltration. Flow of moisture through root zone, soil physical and chemical properties, crop evaporative and drainage requirements, irrigation efficiency and uniformity.

Module II: (10 Hours)

Surface irrigation systems, types of surface systems, basin irrigation, border irrigation, furrow irrigation, field measurement techniques, flow measurement, flumes, weirs, irrigation events, advance, wetting, depletion and recession phases.

Module III: (10 Hours)

Infiltration, infiltrometer, ponding methods, soil water, tensiometers, neutron probe, time domain reflectometer, evapotranspiration, crop coefficient, leaf area index, FAO guide lines on evapotranspiration estimation.

Module IV: (10 Hours)

Fundamentals of surface irrigation hydraulics, continuity equation, momentum equation

Module V: (5 Hours)

Drainage principles, need for drainage, steady state equations, Hooghoudt, Kirkham, Dagan and Ernst equations.

4. CVSD0119: Solid and Hazardous Waste Management

3 Credits-[L-T-P:3-0-0]

Course objectives:

1. Understanding of problems of municipal waste, biomedical waste, hazardous waste, e waste, industrial waste etc.
2. Knowledge of legal, institutional and financial aspects of management of solid wastes.
3. Become aware of Environment and health impacts solid waste mismanagement

4. Understand engineering, financial and technical options for waste management

Course Outcomes:

After completion of the course students should be able to:

CO I:Comprehend the health and environmental impacts associated with solid waste management.(Understand)

CO II:-Perform sampling and characterization of solid waste.(Apply)

CO III:Analyze hazardous waste constituents, addressing quality assurance and quality control (QA/QC) issues.(Analyze)

CO IV: Implement the steps in solid waste management, including waste reduction at the source, collection techniques, materials and resource recovery/recycling, transportation and disposal.(Apply)

CO V:Develop sustainable waste management practices tailored to rural settings.(Apply)

Detailed Syllabus

Module I:

Solid Wastes: Origin, Analysis, Composition and Characteristics:Solid Waste- Types and classification
Waste sources and generation rates ,Integrated Solid Waste Management System: Collection, Storage, Segregation,Reuse and Recycling possibilities, Transportation, Treatment / Processing and Transformation Techniques, Final Disposal. Factors influencing waste generation and health hazards ,Waste composition ,Waste collection , Characterization of wastes

Module II

Management of: Municipal, Biomedical, Nuclear, Electronic and Industrial Solid Wastes and the rules and regulations.Waste processing : Size and volume reduction ,Waste minimization, waste hierarchy and waste audit,Recycling of solid wastes.

Hazardous waste- Definition, sources, classification, collection and segregation,Hazardous waste characterization, treatment and disposal,Radioactive wastes

Module III

Composting ,Vermicomposting ,Biogas production from solid waste,Thermal treatment of solid waste – Incineration Thermal treatment of solid waste – Pyrolysis and gasification

Module IV

Landfill disposal, Current Management Practices, Environmental audit, Pollution Prevention, Facility Development and operation, Site Remediation: Quantitative risk assessment, site and subsurface characterization, Containment,remedial alternatives.

Module V

Solid waste disposal – Sanitary landfilling- , Landfill leachate, Ground water contamination and gas management,Landfill bioreactors, Fly ash- Generation and management ,Fly ash management ,Solid waste management rules, 2016 , Hazardous and other waste (management and transboundary movement) amendment rules, 2016, Plastic waste management rules, 2016,Basel Convention on the control of transboundary movement of hazardous waste and their disposal ,Mechanical biological treatment of solid wastes

Module VI

Solid waste management in rural areas ,Swachh Bharat Abhiyan , Recent advances in solid waste management

PE3:**1. CVGE0120: GEOTECHNICAL EARTHQUAKE ENGINEERING**

3 credits - (L-T-P: 3-0-0)

Objectives: The aim of the course is to familiarise students with the causes and quantification of earthquakes and to familiarise them with the effects of earthquakes and the design criteria required for the design of various geotechnical structures.

COURSE / LEARNING OUTCOMES

Upon completion of this course, students will be able to

CO1: Demonstrate the principles of earthquake loading (Apply)

CO2: Quantify earthquake intensity and various ground motions(Evaluate))

CO3: Perform a deterministic and probabilistic seismic hazard analysis considering different soil properties and site conditions (Apply)

CO4: Analyse the liquefaction susceptibility of a site(Analyze)

CO 5: Design earthquake-resistant foundations, retaining walls, slopes etc.(Create)

Syllabus Contents:

Unit I: Earthquake seismology: Causes of earthquake, Plate tectonics, Earthquake fault sources, Seismic waves, Elastic rebound theory, Quantification of earthquake, Intensity and magnitudes, Earthquake source models.

Unit II: Earthquake ground motion: -Strong motion measurement, ground motion parameters and their estimation, seismic hazard analysis - deterministic and probabilistic, wave Propagation - Waves in a Semi- infinite body, layered body, attenuation of stress waves.

Unit III: Ground response analysis: One, two and three-dimensional ground response analysis.

Unit IV: Liquefaction and lateral spreading - Liquefaction related phenomena, Liquefaction susceptibility: Historical, Geological, Compositional and State criteria. Evaluation of liquefaction by cyclic stress and cyclic strain approaches, Lateral deformation and spreading, Criteria for mapping liquefaction hazard zones.

Unit V: Seismic design of foundations, Seismic slope stability analysis: Internal stability and weakening instability and Seismic design of retaining walls.

2. CVDS0121Design of Sub-Structure

3 credits-45 Hours (L:T:P:3:0:0)

Course Objective:

Course Outcomes: At the end of the course, students will be able to

CO1. Decide the suitability of soil strata for different projects.(Understand)

CO2. Design shallow foundations deciding the bearing capacity of soil, and Analyze and design the pile foundation, foundation on expansive soil. (Apply)

CO3. Understand analysis methods for well foundation, Analyze and design of the machine foundation (Understand, Create)

Module I [10 hours]: Shallow Foundation

Soil investigation – Basic requirements of foundation, types and selection of foundations, bearing capacity of soil, plate load test, design of reinforced concrete isolated, strip, combined and strap footings, mat foundation.

Module II [10 hours]: Pile Foundation

Introduction, Types of pile foundations, load carrying capacity, pile load test, structural design of straight piles, configuration of piles, different shapes of pile cap, structural design of pile cap.

Module III [10 hours]: Well Foundation

Types of well foundation, grip length, load carrying capacity, construction of wells, failures and remedies, design of well foundation, lateral stability

Module IV [8 hours]: Machine Foundation

Introduction, types of machine foundation, basic principles of design of machine foundation, dynamic properties of soil, vibration analysis of machine foundation, design of foundation for reciprocating machines and impact machines, reinforcement and construction details, vibration analysis.

Module V [7 hours]: Special Foundation

Foundation on expansive soils, choice of foundation, under-reamed pile foundation, foundation for concrete towers, chimneys, design of anchors, reinforced earth retaining walls.

3. CVAS0122: Advanced Steel Design (3: 0: 0=3 Credits)**Course Objectives**

The steel structures have found significant applications in different infrastructural projects as they offer various advantages over reinforced concrete construction. To understand the behaviour of steel structures and design philosophy, the course is framed for the post graduate students with following objectives:

To apply the design principles in beams and frames

To understand design philosophy and stability of beams and columns

To apply the design methods for industrial buildings.

Course Outcomes

After Successful completion of the course, students will be able to :

CO1: Familiarize with plastic design of steel structures and its applications (Understand)

CO2: Understand failure criteria of tension member and stability of steel columns (Understand)

CO3: Understand the concept of shear centre in steel structure and calculation of stresses in unsymmetrical bending. (Evaluate)

CO4: Design components of industrial buildings (create)

Detailed Syllabus:**Module-I: Properties of Steel (5 hours)**

Introduction, Types of structural steel, Mechanical Properties, Residual stress, stress concentration, hysteresis, ductility, Cold formed steel, hot rolled section, High performance and stainless steel.

Module II: Basis of Structural Design (10 hours)

Structural systems and integrity, Joints and mechanical fasteners, Design actions, Methods of Design- Allowable stress, plastic method, Load resistance Factor design, Strength and Drift Criteria: P- Δ Effect, Deformation Based Design; elastic and inelastic analysis, plastic analysis of steel structures, concept of plastic hinge and collapse mechanism, effect of axial force on plastic moment capacity, deflection at ultimate load.

Module III: Axially loaded member (10 hours)

Failure criteria of tension member, staggered bolts, stress concentration due to holes, stability of steel column, Buckling analysis, imperfection in column and its effect on the strength of column, compound columns for heavily loaded structures, Members subjected to combined axial force and bending moment, local buckling of flanges and webs, critical load for steel frames, torsional buckling, column base, design of anchor bolts

Module IV: Flexural member (8 hours)

Stability of Beams, laterally restrained beams, unrestrained beams, flexure-torsional buckling in unrestrained beam, Plastic design of continuous beams and frames, Built up beams, prevention of web buckling, stiffener design, steel-concrete composite construction, composite sectional properties, design of shear connector.

Module V: Unsymmetrical bending (6 hours)

Unsymmetrical steel sections, principal axes, maximum bending stress, shear centre and its calculation for steel section, design of beams under unsymmetrical bending.

Module VI: Industrial Building (6 hours)

Structural framing, selection of roofing and wall material, Roof trusses, Wind load calculations as per IS 875-Pt III, gantry girder, design of sections, columns and foundations.

4. CVFH0123: Fluvial Hydraulics
(3 credits) (L-T-P:3-0-0)
Objective:

The primary objective of this course is to provide students with a comprehensive understanding of sediment dynamics in river systems. The course covers the properties of sediments, the mechanisms of sediment transport, and the challenges associated with sediment problems. Students will learn to analyze and design stable channels and sediment control structures using both physical and mathematical models. Emphasis will be placed on practical applications such as bed level variations, local scour, degradation, aggradation, and reservoir sedimentation, along with the design of guide bunds and other river training banks.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

CO1. Explain the properties of sediments, the challenges associated with sediment problems, and the concepts of incipient motion for both uniform and non-uniform sediments. (Understand)

CO2. Analyze the formation of bed forms and the factors contributing to channel resistance and evaluate sediment transport mechanisms, including bed load and suspended load transport, for both uniform and non-uniform bed materials. (Analyse)

CO3. Design stable channels and guide bunds and other river training banks, addressing issues such as bed level variations, local scour, degradation, aggradation, and reservoir sedimentation. (Create)

Syllabus:**Module I : (10 Hours)**

The sediment problems, properties of sediments, incipient motion of uniform and nonuniform sediments.

Module II : (10 Hours)

Bed forms and channel resistance. Bed load and suspended load transport for uniform and non-uniform bed material, total load equations, sediment sampling.

Module III: (15 Hours)

Stable channel design and sediment control. Bed level variations, local scour, degradation, aggradation and reservoir sedimentation. Physical and mathematical models.

Module IV: (10 Hours)

Design of guide bunds and other river training banks.

PE4.**1. CVAF0124: ADVANCED FLUID MECHANICS**

(3 credits) (L-T-P:3-0-0)

Objective:

The subject Fluid Mechanics has a wide scope and is of prime importance in several fields of engineering and science. Present course emphasizes the fundamental underlying fluid mechanical principles and application of those principles to solve real life problems.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

Understand and explain the kinematics of fluid flow and the equation of continuity. (Understand)

Apply standard 2D flow patterns, such as sources, sinks, and doublets, to construct complex flows through superposition and solve the Laplace equation using graphical, relaxation methods, and conformal mapping. (Apply)

Evaluate and analyze turbulent flows and interpret turbulence characteristics. (Evaluate, Analyse)

Module I : (5 Hours)

Kinematics of Flow: Equation of continuity in cartesian, polar and cylindrical coordinates.

Module II: (10 Hours)

Standard 2D Flow Patterns: Source, sink, doublet and their combinations, construction of flows by superposition, D'Alembert's paradox, Laplace Equation: Solution by graphical and relaxation methods, conformal mapping, solution by separation of variables

Module III: (8 Hours)

Laminar Flow: Derivation of Navier-Stokes equations – exact solutions for flow between parallel plates, Couette flow, flow near a suddenly accelerated plate and an oscillating plate.

Module IV: (10 Hours)

Boundary Layers: Similarity solutions of boundary layer equations, Falkner-Skan Wedge flows, Karman's momentum integral equations, Karman-Pohlhausen approximate solution, separation in boundary layer under adverse pressure gradient, turbulent boundary layer.

Module V: (12 Hours)

Turbulent Flows: Reynolds equations of motion, semi-empirical theories of turbulence, velocity profiles for inner, outer and overlap layers, equilibrium boundary layers. Measurement of Turbulence and Statistical Theory of Turbulence: Isotropic and homogeneous turbulence, probability density functions, correlation coefficients, decay of isotropic turbulence.

2. CVPA0125: PAVEMENT ANALYSIS AND DESIGN

(3 credits — 45 hours) (L-T-P:3-0-0)

Objectives: *The objective of the course is to provide postgraduate students with a thorough understanding of the principles and practices involved in the design of flexible and rigid pavements. The course covers analytical methods for pavement analysis, selection of design input parameters, material characterisation, drainage, and failure criteria. Students will learn to design pavements using various methods, compare different design approaches, and design overlays and drainage systems, enhancing their expertise in pavement engineering.*

COURSE /LEARNING OUTCOMES

At the end of the course students will be able to:

- CO1:** Understand the fundamental principles behind the design of flexible and rigid pavements, demonstrating foundational knowledge in pavement engineering. (Understand)
- CO2:** Analyse and apply various analytical methods to evaluate pavement structures, enhancing their analytical and problem-solving skills. Analyse. Apply)
- CO3:** Evaluate design inputs, critically assess and select appropriate pavement design input parameters such as traffic loading, volume, and material properties, ensuring accurate and reliable design. (Evaluate)
- CO4:** Design flexible and rigid pavements using different methodologies, showcasing their ability to synthesise and apply theoretical knowledge to practical scenarios. (Apply)
- CO5:** Evaluate and compare different pavement design approaches, including overlays and drainage systems, to determine the most effective solutions, demonstrating their capacity for critical thinking and optimisation.(Evaluate)

Module I: Fundamentals and Philosophy of Pavement Design (8 hours)

Introduction to pavement types: flexible and rigid pavements, Basic principles and philosophies underlying pavement design, Functional requirements of pavements: structural and serviceability considerations. Analytical methods for pavement analysis: empirical, mechanistic-empirical, and theoretical approaches, Stress-strain behaviour of pavement materials under load.

Module II: Pavement Design Input Parameters and Material Characterisation (10 hours)

- a) Traffic data collection and analysis for pavement design, Load equivalency factors and load spectra, Impact of axle loads and tire pressures on pavement performance.
- b) Material properties and characterisation techniques for pavement materials, Failure criteria for flexible and rigid pavements, Reliability concepts in pavement design and performance prediction.

Module III: Design Methods for Flexible and Rigid Pavements (17 hours)

Design methodologies for flexible and rigid pavements, Mechanistic-empirical design approaches for both flexible and rigid pavements, Software tools for pavement design

Module IV: Comparative Approaches, Overlays, and Drainage Systems (10 hours)

Comparative analysis of different pavement design approaches: strengths and limitations, Design and rehabilitation of pavement overlays: flexible and rigid, Advanced drainage system design and its integration with pavement structures.

3. CVCS0126: Design of Advanced Concrete Structures

Credit: 3 (L:T:P-3:0:0)

Course Objective:

The objective of this course is to provide students with an advanced understanding of the principles and practices involved in the structural design of reinforced concrete and steel structures.

Course Outcomes:

At the end of the course, students will be able to

CO1: Evaluate different design approaches and select appropriate methodologies for analyzing and designing structural systems.(Evaluate)

CO2: Design reinforced concrete structures with advanced techniques using various relevant design codes and able to apply them in practical design scenarios.(create)

CO3: Analyze various steel structures for various engineering applications applying relevant standards such as IS code, AISC standards, and Eurocode. (Analyse)

Syllabus:**Module I: (8 hours)**

Design Philosophy: Modeling of Loads, Material Characteristics, principles that prioritize safety, durability, sustainability, and efficiency.

Module II: (22 hours)

Reinforced Concrete Structure: Axial load (P) - Bending moment (M), M-phi Relationships, Strut-and-Tie Method, Design of Deep Beam and Corbel, Design of Shear Walls, Compression Field Theory for Shear Design, Design against Torsion; IS, ACI and Eurocode.

Module III: (15hours)

Steel Structures: Stability Design, Torsional Buckling - Pure, Flexural and Lateral, Design of Beam-Columns, Fatigue Resistant Design, IS code, AISC Standards and Eurocode.

4. CVEG0127: ENVIRONMENTAL GEOTECHNOLOGY

3 Credits : 45 Hours (L:T:P-3:0:0)

Course Objectives

The main objectives of this course are:

To understand the soil-environment interaction, Soil mineralogy and Mechanisms of soil-water interaction
To learn ground water flow and contaminant transport phenomenon.

To Learn about the principles and practices of waste management, including the design and construction of landfills, hazardous waste containment systems, and other waste disposal methods.

Course Outcomes:

After Successful completion of the course students will be able to:

CO1: Understand Soil-environment interaction, Soil mineralogy and Mechanism of soil-water interaction (Understand)

CO2: Demonstrate a thorough understanding of the physical, chemical, and biological processes that govern the behavior and transport of contaminants in soil and groundwater. (Apply)

CO3: Apply principles of geotechnical engineering to design effective waste management systems, including landfills and hazardous waste containment systems. (Apply)

CO4: Select and implement appropriate remediation technologies for various types of contaminated sites, assessing their effectiveness and limitations. (Understand, Apply)

Module I:[8 hours]

Introduction to Geo Environmental Engineering., Sources & Impact of Contamination and Soil-Waste Interaction

Concepts of Integrated SWM & Geoenvironmental Engineering.

Module II:[7 Hours]

Concepts of waste containment; Sources, production and classification of wastes, Environmental laws and regulations, ground water flow and contaminant transport, desirable properties of soil; contaminant transport and retention; contaminated site remediation.

Module II:[10 Hours]

Mechanisms of soil-water interaction: Diffuse double layer models; Force of attraction and repulsion; Soil-water-contaminant interaction; Theories of ion exchange; Influence of organic and inorganic chemical interaction

Principles and Planning of Landfills, Liners for Landfills, Landfill Covers, Generation and Control of Leachate and Gas from Landfills, Stability of Slopes and Settlement of Landfills

Module III: [10 Hours]

Contaminant analysis. Contaminated site characterization, estimation of landfill quantities, landfill site location, design of various landfill components such as liners, covers, leachate collection and removal, gas generation and management, ground water monitoring, end uses of landfill sites.

Solved examples, Monitoring and Detection of Subsurface Contamination, Costs, Construction Aspects and Site Selection of Landfills. Control, Rehabilitation of Old Dumps and Contaminated Sites.

Module IV: [10 Hours]

Slurry Deposited Waste and their Geotechnical Properties .Planning & Design, Incremental Raisings and Failures of Slurry Ponds ,slurry walls and barrier systems, design and construction, stability, compatibility and performance, remediation technologies, stabilization of contaminated soils and risk assessment approaches. Environmental Control Measures at Slurry Ponds, Geotechnical Reuse of Waste

PE5:**1. CVPS0128: Design of Prestressed Concrete Structures**

Credit: 3 (L:T:P-3:0:0)

Course Objective:

The objective of the course is to provide students with a comprehensive understanding of the principles and practices involved in the design and analysis of prestressed concrete systems. At the end of this course, students will be equipped with the necessary knowledge and skills to effectively design and analyze prestressed concrete structures, preparing them for professional practice in the field of civil and structural engineering.

Course Outcomes: At the end of the course, students will be able to

CO1: Identify different prestressing systems and understand the behavior of high-strength concrete and high-strength steel.

CO2: Perform deflection and crack width calculations to assess the serviceability of prestressed concrete structures under various loading conditions(Evaluate)

CO3: Perform analysis and design of prestressed flexural members for limit states of collapse, serviceability, shear and torsion (Apply)

CO4: Analyze the transmission of prestress in anchorage zones and design the end blocks. (Analyze)

CO5: Perform analysis and design of statically indeterminate members leading to the determination of cable profile (Apply)

Syllabus:

Module I: (4 hours)

Concept of Prestressing, Types of Prestressing, Advantages, Limitations, Pre stressing systems - Pre-tensioning and Post tensioning methods, Anchoring devices, Materials - High strength concrete and High strength steel, Stress-Strain curve for High strength concrete, Analysis of prestressed concrete flexural members – Basic concepts, Ultimate strength in flexure – Codal provisions.

Module II: (5 hours)

Losses in Pre stress: Loss of Prestress due to Elastic shortening, Friction, Anchorage slip, Creep of concrete, Shrinkage of concrete and Relaxation of steel, Deflection and Crack Width Calculations - Deflection due to gravity loads, Deflection due to prestressing force, Total deflection, Limits of deflection, Limits of span-to-effective depth ratio, Calculation of Crack Width - Limits of crack width.

Module III: (14 hours)

Statically Determinate members – Analyze and Design flexural members for ultimate and serviceability limit states, Analyze and design for Shear and Torsion, Codal provisions

Module IV: (14 hours)

Design of End Blocks - Transmission of prestress in Pre-tensioned members, Anchorage zone stresses for Post-tensioned members.

Module V: (8 hours)

Statically Indeterminate members - Analysis and design of continuous beams and frames, Choice of cable profile, Linear transformation and concordancy, Analysis and design of prestressed concrete pipes and columns with moments.

2. CVWT0129: Industrial waste treatment technology[3-0-0]

Course Objectives:

This course aims to provide a comprehensive understanding of the characteristics and environmental impacts of industrial wastewater. Students will learn about the physico-chemical and biological treatment

methods, and sludge management. This course equips students with the knowledge and skills to develop sustainable and efficient industrial waste treatment solutions.

Course outcomes:

Upon completing the course "Industrial Waste Treatment," students will be able to:

CO1:Analyze and Characterize Industrial Wastewater.?(Analyze)

CO2:Design and Implement Waste Minimization Strategies.(Apply)

CO3:Apply Physico-Chemical and Biological Treatment Methods for Industrial waste water.(Apply)

CO4:Manage the production of Sludge and its treatment.(Understand , Apply)

CO5: Evaluate and Implement Wastewater Reuse Systems. (Apply)

Detailed Syllabus

Module I [5 Hours]

Industrial wastewater – Characteristics – Environmental impacts – Effects of industrial wastes on streams, land – Effluent standards – Scenario in India –

Module II [10 Hours]

Regulatory requirements for industrial wastewater – Prevention Vs control of industrial pollution – Volume reduction – Process Modification – Strength reduction – Methods and materials changes – Waste minimization strategies – Zero discharge concept.

Module III [10 Hours]

Physico-chemical treatment of industrial wastewater – Equalization and neutralization – Separation of solids – Removal of organic and inorganic solids – Oil separation – Precipitation – Membrane methods – Reverse Osmosis – Biological treatment methods – Aerobic and anaerobic methods.

Module IV[10 Hours]

Separation Vs degradation methods – Chemical oxidation – Photocatalysis – Ozonation – Ion exchange – Advanced oxidation processes – Electrochemical methods – Nutrient removal – Land treatment – Sludge production and its management – Quantification and characteristics of sludge – Treatment of sludge and its disposal.

Module V[10 Hours]

Reuse of industrial wastewater – Advantages – Quality requirements for reuse – Zero effluent discharge systems – Residuals of industrial wastewater treatments – Individual and common effluent treatment plants.

3. CVCM0130: COST MANAGEMENT OF ENGINEERING PROJECTS

3 credits - (L-T-P: 3-0-0)

Objectives: The course aims to provide comprehensive knowledge of the cost management process and cost accounting systems and to enable students to understand basic concepts of project planning, implementation and control. It covers different types of costs and their behavior, integrates the principles of quality management, and identifies different types of budgets involved in the cost management process. In addition, the course is designed to enhance students' career potential by equipping them with advanced techniques and problem-solving skills in cost management.

COURSE / LEARNING OUTCOMES

After Completion of the Course, Student will able to

CO1: Understand the concepts of the strategic cost management process.(Understand)

CO2: Apply cost concepts in decision making and cost management projects.(Apply)

CO3: Implement different phases of project execution in a team project.(Apply)

CO4: Analyse different decision problems.(Analyse)

CO5: Evaluate different qualitative techniques and cost behaviour.(Evaluate)

Detailed Syllabus :

Module I:3 Hours

Introduction: Introduction and overview of the process of strategic cost management.

ModuleII: 7 Hours

Cost concepts: cost concepts in decision making; relevant costs, differential costs, incremental costs and opportunity costs. Objectives of a cost accounting system; inventory valuation; creating a database for operational control; providing data for decision making.

Module III:15 hours

Project: meaning, different types, why manage, cost overrun centres, different phases of project execution: conception to commissioning. Project execution as a conglomerate of technical and non-technical activities. Detailed engineering activities. The most important approvals and documents prior to project implementation. Project team: role of the individual members. Significance of the project location: Required data with significance. Project contracts: Types and contents. Project implementation Project cost control. Bar charts and network diagrams. Project commissioning: mechanics and procedures.

Module IV: 15 Hours

Cost behavior and profit planning Marginal costing: Distinction between marginal costing and absorption costing; break-even analysis, cost-volume-profit analysis. Various decision problems. Standard cost accounting and variance analysis. Pricing strategies: Pareto analysis. Target costing, life cycle costing. Cost accounting in the service sector. Just-in-time approach, material requirements planning, enterprise resource planning, total quality management and theory of constraints. Activity-based cost management, benchmarking; balanced score card and value chain analysis. Budget control; flexible budgets; performance budgets; zero-based budgets. Measuring the profitability of business units; pricing decisions including transfer pricing.

Module V: 5 Hours

Quantitative techniques for cost management, linear programming, PERT/CPM, transportation problems, allocation problems, simulation, learning curve theory.

4. CVER0131:Earth Retaining Structures**(3 credits – 45 hours) (L-T-P: 3-0-0)****Objectives**

The objective of this course is to prepare students to analyze and design various types of earth retaining structures.

COURSE / LEARNING OUTCOMES

At the end of the course students will be able to

CO1: Understand various theories in Earth Pressure. (Understanding)

CO2: Explore the Stability of retaining structure. (Applying)

CO3: Analyze the sheet pile walls. (Analyzing)

CO4: Explain aspects related to the design of bulkheads, tunnels, conduits, and braced excavations. (Creating)

Module I: 5 Hours

Earth Pressure: Rankine and Coulomb theories, active, passive and pressure at rest; concentrated surcharge above the back fill, earth pressure due to uniform surcharge, earth pressure of stratified backfills, saturated and partially saturated backfill.

Module II: 10 Hours

Retaining walls: Proportioning of retaining walls, stability of retaining walls, mechanically stabilized retaining walls/reinforced earth retaining walls.

Module III: 15 Hours

Sheet Pile wall: free earth system, fixed earth system.

Module IV: 15 Hours

Bulkheads: bulkheads with free and fixed earth supports, equivalent beam method, Anchorage of bulkheads and resistance of anchor walls, spacing between bulkheads and anchor walls, resistance of anchor plates.

Module V: 15 Hours

Tunnel and Conduit: Stress distribution around tunnels, Types of conduits, Load on projecting conduits; Arching and Open Cuts: Arching in soils.

Module VI: 15 Hours

Braced excavations: Earth pressure against bracings in cuts, Heave of the bottom of cut in soft clays.

Suggested Readings:

PE6:**1. CVCC0132: Cement Composite materials****(3 credits) (L-T-P:3-0-0)****Objective:**

The course aims to equip students with a solid foundation in composite materials, particularly cement composites, and their applications in various structural elements. The course emphasizes both theoretical knowledge and practical skills necessary for analyzing and designing composite material structures.

Module I : (10 Hours)

Introduction: Classification and Characteristics of Composite Materials- Basic Terminology, Advantages. Stress-Strain Relations- Orthotropic and Anisotropic Materials, Engineering Constants for Orthotropic Materials, Restrictions on Elastic Constants, Plane Stress Problem, Biaxial Strength, Theories for an Orthotropic Lamina.

Module II : (10 Hours)

Mechanical Behaviour: Mechanics of Materials Approach to Stiffness- Determination of Relations between Elastic Constants, Elasticity Approach to Stiffness- Bounding Techniques of Elasticity, Exact Solutions - Elasticity Solutions with Continuity, Halpin, Tsai Equations, Comparison of approaches to Stiffness.

Module III : (10 Hours)

Cement Composites: Types of Cement Composites, Terminology, Constituent Materials and their Properties, Construction Techniques for Fibre Reinforced Concrete - Ferrocement, SIFCON, Polymer Concretes, Preparation of Reinforcement, Casting and Curing. Mechanical Properties of Cement Composites: Behavior of Ferrocement, Fiber Reinforced Concrete in Tension, Compression, Flexure, Shear, Fatigue and Impact, Durability and Corrosion.

Module IV : (10 Hours)

Application of Cement Composites: FRC and Ferrocement- Housing, Water Storage, Boats and Miscellaneous Structures. Composite Materials- Orthotropic and Anisotropic behaviour, Constitutive relationship, Elastic Constants.

Module V : (5 Hours)

Analysis and Design of Cement Composite Structural Elements - Ferrocement, SIFCON and Fibre Reinforced Concrete.

COURSE/LEARNING OUTCOMES

At the end of this course students will be able to:

Understand and explain the classification, characteristics, and stress-strain relations of composite materials, including orthotropic and anisotropic materials.

Analyze the mechanical behavior of composite materials using the mechanics of materials approach and elasticity approach to stiffness, and compare different methods.

Design and apply various types of cement composites such as ferrocement, SIFCON, and fiber-reinforced concrete in practical applications.

COURSE MAPPING:

	CO1	CO2	CO3
Module I	H	M	
Module II		H	
Module III		L	H
Module IV		M	H
Module V		M	H

Suggested Readings

Mechanics of Composite Materials, Jones R. M., 2nd Ed., Taylor and Francis, BSP Books, 1998.

Ferrocement – Theory and Applications, Pama R. P., IFIC, 1980.

New Concrete Materials, Swamy R.N., 1stEd., Blackie, Academic and Professional, Chapman & Hall, 1983.

Material Science and Technology – Vol 13 – Composites by R.W.Cahn – VCH, West Germany.

Hand Book of Composite Materials-ed-Lubin.

Composite Materials – K.K.Chawla.

Composite Materials Science and Applications – Deborah D.L. Chung.

2. CVOT0133: OPTIMIZATION TECHNIQUES IN CIVIL ENGINEERING

(3 Credits) (L: T:P: 3-0-0)

Objectives

Impart knowledge on the theory of optimization and conditions for optimality for unconstrained and constrained optimization problems

Instil modelling skills necessary to formulate and solve optimization problems in the domain of Civil Engineering.

Familiarize the learners with the working principle of optimization algorithms used to solve linear and non-linear problems

Course/ Learning Outcomes

At the end of this course:

Students will learn the basic philosophy of optimization problems.

Students will be able to formulate and solve linear programming problems.

Students will be able to demonstrate the usage of various direct and indirect non-linear search methods in solving design problems.

Students will be able to find the optimum solution of their problems using genetic algorithm.

Module I (5 hours)

Introduction to optimization, classification of optimization problems, classical optimization techniques.

Module II (10 hours)

Linear Programming: Formulation of LPP, Graphical solution, Simplex method, Big-M method, Revised simplex method, Duality theory and its application, Dual simplex method, Sensitivity analysis in linear programming.

Module III (10 hours)

Non-Linear Programming: - One dimensional minimization, unconstrained and constrained minimization, direct and indirect methods.

Module IV (10 hours)

Geometric programming, Optimum design of structural elements like beams and columns.

Module V (10 hours)

Introduction to Genetic Algorithms, Operators, applications to engineering optimization problems.

Suggested Readings

S. S. Rao, "Engineering Optimization: Theory and Practice", Wiley, 2008.

K. Deb, "Optimization for Engineering design algorithms and Examples", Prentice Hall, 2005.

S. R. Komaragiri and N. Kumar, "Multicriterion Analysis in Engineering and Management", Prentice Hall, 2010.

CVEI0134: Environmental Impact Analysis and Assessment

(3 Credits) (L: T:P: 3-0-0)

Objectives:

Understand the concept, historical context and wider importance of EIA

Know the key steps in the EIA process.

Understand the importance of Social Impact Assessments and public participation in the EIA process.

Gain an overview of methods and tools that are commonly used to develop an EIA.

Improve collaborative skills and thus gain skills relevant for collaborative EIA development.

Course Outcomes

CO1. Identify Environmental Impacts and methods of their assessment. (Understand)

CO2. Select the mitigation methods of different Environmental Impacts. (Apply)

CO3. Interpret the implications Environmental attributes, Environmental settings and EIA notifications.(Evaluate)

CO4. Implement the Prediction Methods of assessments of Impacts (Apply)

Syllabus:**Module I:(5 Hours)**

Introduction to Environment Management & EIA, Legal, Policy & Regulatory Framework

Module II:[8 Hours]

EIA Procedure - Scoping & Screening and Establishing Baseline Conditions, EIA Methodologies

Module III: [8 Hours]

Connectedness: connected spaces and subspaces, Connectedness of the real line, Intermediate value theorem, EIA Methods, Tools and Techniques

Module IV:[8 Hours]

Public Involvement in EIA , Impact Management - Mitigation & Preparation of Environment Management Plans (EMP)

Module V: [8 Hours]

EIA Reporting & Review of EIA Quality, Decision Making & Project Management

Module VI:[8 Hours]

Implementation & Follow up, EIA Case Examples

Suggested Readings:

- 1) Wathern P., "Environmental Impact Assessment: Theory and Practice", Routledge Publishers, 1990
- 2) Marriott B., "Environmental Impact Assessment: A Practical Guide", McGraw-Hill Publication, 1997
- 3) Shrivastava A.K., Baxter Nicola, Grimm Jacob, "Environmental Impact Assessment", APH Publishers, 2003

4. CVGW0135: GROUND WATER ENGINEERING**(3 Credits) (L: T:P: 3-0-0)****Objectives**

To learn the fundamentals of groundwater flow.

To learn the hydraulics of different kinds of wells.

To evaluate the aquifer parameters and groundwater level variations for different hydro-geological boundary conditions.

To understand the various facets of ground water quality modelling.

Enable the learners to understand the significance of conjunctive use of ground water along with other fresh water sources.

Course/ Learning Outcomes

At the end of this course students will be able to:

Understand aquifer properties and movement of ground water.(Understand)

Comprehend well hydraulics problems under various hydro-geological scenarios.(Understand)
 Summerise basic concepts and techniques associated with ground water flow modelling.(Understand)
 Identify major sources and types of groundwater contamination.(Understand)
 Understand the challenges and subsequent strategies necessary for groundwater management.
 (Understand)

Module I (15 hours)

Introduction: Definition of groundwater, role of groundwater in hydrological cycle, groundwater bearing formations, classification of aquifers, flow and storage characteristics of aquifers, Darcy's law, anisotropy and heterogeneity, Governing Equations for Groundwater Flow: Dupuit-Forchheimer assumptions, general differential equations governing groundwater flows and their analytical solutions.

Module II (10 hours)

Wells and Well Hydraulics: Different types of wells, construction of wells, steady and unsteady state solutions for confined, unconfined and leaky aquifers, effect of boundaries, method of images, pumping test analysis.

Module III (10 hours)

Groundwater Flow Modelling: Role of groundwater flow models, basic introduction to hydraulic, Hele-Shaw and analog models, introduction to numerical modeling.

Module IV (5 hours)

Groundwater Quality: General problem of contamination of groundwater, sources, remedial and preventive measures, seawater intrusion in coastal aquifers.

Module V (5 hours)

Groundwater Conservation: Regional groundwater budget; resource assessment; estimation of recharge, Indian practice for artificial recharge, Planning of Groundwater Development: constraints on the development, role of flow models, optimal groundwater development.

Suggested Readings

Todd, D.K., "Groundwater Hydrology", John Wiley. 1959
 Bear, J., "Hydraulics of Groundwater", McGraw. 1979

Core Lab1 – CVSD6050: Structural Design Lab

Credits: 2 (L:T:P--0:0:4)

Course Objective:

The course will equip students with the necessary skills and knowledge to independently design and produce detailed drawings of complete structures. Through hands-on projects, students will gain practical experience in applying design principles and standards to real-world structural engineering scenarios. Furthermore, students will learn to design complete multistory buildings using both the Equivalent Static Method and Dynamic Analysis Method.

Course Outcomes: At the end of the course, students will be able to

CO1: Design and Detail all the Structural Components of Frame Buildings.

CO2: Design and Detail complete Multi-Storey Buildings using equivalent static and dynamic analysis method.

List of Experiments/Assignments:

Experiment I: Design and detailed drawing of complete G+ 3 structures by individual student using latest relevant IS codes.

Experiment II: Design a Multi-Storey building using Equivalent Static Method.

Experiment III: Design a Multi-Storey building using Dynamic Analysis Method.

Suggested Readings:

Sap2000 (Structural Analysis and Design) software.

STADD Pro (3D Structural Analysis and Design) Software.

AutoCAD software for 2D and 3D structures

ETABS (Building Analysis and Design) software.

Core Lab 2-

CVNA6051: Numerical Analysis lab

2 credits-30 Hours (L:T:P:0:0:2)

Course Objectives: The course aims to provide the knowledge of computer programming to write the codes for the numerical methods learned in “Numerical Analysis” using C language and/or MATLAB.

Course Outcomes: Upon successful completion of the course, students will be able to:

CO1. Write computer programs to solve engineering problems with MATLAB and/or C Language.(Apply)

CO2. Implement numerical methods in MATLAB /C Language.(Apply)

CO3. Analyze the stability of the algorithm.(Analyze)

CO4. Analyze and evaluate the accuracy of common numerical methods.(Evaluate)

CO5. Ability to use approximation algorithms in real-world problems.(Apply)

List of Practicals:

Gaussian elimination, Jacobi, Gauss Seidel methods.

Bisection method, fixed point iteration scheme, Newton-Raphson method, secant method.

Lagrange's interpolation formula, Newton's divided difference formula.

Trapezoidal rule, Simpson's 1/3,3/8-rules.

Euler's method modified Euler's method, Runge-Kutta method, Milne's method, Adams-predictor-corrector method.

Essential Readings:

1. W. H. Press, B. P. Flannery, S. A. Teukolsky, W. T. Vetterling, “Numerical Recipes in C”, Cambridge University Press, 1st edition,1988.

Supplementary Readings:

1. M. Pal, Numerical Analysis for Scientists and Engineers: Theory and C Programs, Narosa, 2008.

Core Lab 3-
CVSM6052: Soil Mechanics Lab
2 credits - (L-T-P: 0-0-4)

COURSE / LEARNING OUTCOMES

At the end of the course student will be able

CO1: Identify the index properties of soil (Understand)

CO2: Determine the engineering properties of soil (Apply)

CO3: Assess shear strength using the vane shear test (Evaluate)

CO4: Analyze data from standard, static, and dynamic cone penetration tests (Analyze)

List of Practicals:

Determination of Moisture Content and Specific gravity of soil

Grain Size Distribution Analysis and Hydrometer Analysis

Atterberg Limits (Liquid Limit, Plastic limit, Shrinkage limit)

Standard and modified proctor compaction test

Falling head permeability test and Constant head permeability test

Consolidation test

Unconfined compression test

Direct shear test

Tri-axial compression test – UU, CU, CD tests

Laboratory vane shear test

Field Vane shear test

Standard penetration test

Static cone penetration test

Dynamic cone penetration test

Core Lab 4
CVCF6053: COMPUTATIONAL FLUID DYNAMICS LAB
(2 Credits)

Objectives

To develop basic programming skills in computational fluid dynamics to address engineering problems.

To understand the basic structure and capabilities of free and opensource CFD framework OpenFOAM.

To demonstrate the capabilities of OpenFOAM, in conjunction with other opensource software, for simulating flow past 2-dimensional bluff bodies.

Course/ Learning Outcomes

At the end of this course students will be able to:

Write simple scripts in GNU Octave for solving partial differential equations using explicit and implicit finite difference method. (Apply)

Learn the basic methodology of adopted for any CFD simulation process. (Understand)

Comprehend the strengths and weaknesses of the opensource finite volume framework OpenFOAM. (Understand)

Understand the basic structure and usage of OpenFOAM and other opensource packages like GMSH and ParaView demonstrating the significant steps involved in CFD analysis. (Understand)

Analyze basic bluff body hydrodynamics problems using OpenFOAM. (Analyze)

List of Experiments

Solution of one-dimensional unsteady diffusion equation using explicit finite difference method (FDM).

Solution of one-dimensional unsteady diffusion equation using implicit FDM.

Solution of elliptic partial differential equation – Laplace Equation using FDM.

Geometry creation and mesh generation of a 2-dimensional circular cylinder.
Simulation of laminar flow past a circular cylinder using OpenFOAM
Post-processing of the simulation data using ParaView.

Programme outcomes

PO1. An ability to conduct field and laboratory experiments and interpret data in construction industry.

PO2. An ability to design a system to meet desired needs within realistic constraints such as economic, environmental, social, safety and sustainability in construction industry

PO3. An ability to use the techniques, skills and modern engineering tools

PO4. An understanding of professional and ethical responsibility while working in construction industry

PO5. an ability to engage in life-long learning to update the knowledge in construction materials and management

Programme Specific Outcomes

Exhibit detailed professional knowledge in core sub-specializations of civil engineering including structural engineering, geotechnical engineering, hydraulic and environmental engineering and transportation engineering.

Demonstrate analytical and design skills using various technical supports.

Display the ability to tackle research projects and development works in various field of civil engineering using analytical, computational and experimental techniques.

Ability to integrate the knowledge gained from the various core and elective courses for collaborative and multi-disciplinary solutions of different civil engineering challenges.

SCHOOL OF TECHNOLOGY

DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING

VISION

To be a centre of technological excellence for outstanding education and research in electrical and electronics engineering, contributing to the world socially committed engineers capable of accepting the continuous challenges of technological advancements.

MISSION

The department of Electrical and Electronics Engineering of Don Bosco College of Engineering and Technology, School of Technology, Assam Don Bosco University seeks to:

Achieve excellence in teaching, research, practice and extension activities in the fields of Engineering in general and Electrical and Electronics Engineering in particular.

Provide a strong foundation for the students to make them professionally competent for industry and research.

Create an environment for the holistic development of individuals, encouraging them to serve the society with commitment and integrity.

Offer necessary support and guidance to individuals to shape their ideas into reality.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOS)

To create an environment, give opportunity and also encourage the individuals to build a strong foundation of Electrical and Electronics Engineering as well as in related interdisciplinary fields of study, to be able to contribute to the need of the industry and the society at large.

To make students capable of generating ideas, apply their knowledge and analyse the situations for executing live projects in Electrical and Electronics Engineering, with modern tools, equipment and software.

To inculcate the habit of teamwork and infuse management skills in the students for their future professional life.

To guide students to become ethical professionals in their own fields of work and be conscious about the effect of technology on the environment.

PROGRAMME-SPECIFIC OUTCOMES (PSO) OF M.TECH. IN ELECTRICAL AND ELECTRONICS ENGINEERING (SPECIALIZATION- POWER SYSTEMS)

PSO 1: Ability to apply the enhanced knowledge in advanced technologies for modeling, analyzing and solving contemporary issues in the power sector with a global perspective and to carry out detailed and independent investigation on multifaceted complex problems in the area of power systems and to envisage advanced research in allied thrust areas.

PSO 2: Ability to express ideas clearly and communicate orally as well as in writing with others in an effective manner, adhering to various national and international standards and practices for the documentation and presentation of the contents.

PSO 3: Ability to critically analyze and identify real-life engineering problems in the area of power systems; and professionally and ethically provide strategic solutions satisfying the safety, societal, cultural, financial and environmental aspects/ needs with an eagerness for continued pursuance of research to design, develop or propose theoretical and practical methodologies towards the research and development support for the power system infrastructure.

PSO 4: Ability to utilize and develop modern tools for modeling, analyzing and solving various scientific problems related to power systems and to take up technical/administrative challenges including the management of various projects of interdisciplinary nature, working in a team with mutual understandings to take unsophisticated challenges leading and motivating the group to inculcate multidisciplinary and collaborative approach.

PROGRAMME-SPECIFIC OUTCOMES (PSO) OF M.TECH. IN ELECTRICAL AND ELECTRONICS ENGINEERING (SPECIALIZATION- CONTROL SYSTEMS)

- PSO 1: Ability to apply the enhanced knowledge in advanced technologies for modeling, analyzing and solving contemporary issues in system and control engineering with a global perspective and to carry out detailed and independent investigation on multifaceted complex problems in the area of system engineering and control and to envisage advanced research in allied thrust areas.
- PSO 2: Ability to express ideas clearly and communicate orally as well as in writing with others in an effective manner, adhering to various national and international standards and practices for the documentation and presentation of the contents.
- PSO 3: Ability to critically analyze and identify real-life engineering problems in the area of control systems; and professionally as well as ethically provide strategic solutions satisfying the safety, societal, cultural, financial and environmental aspects/ needs with an eagerness for continued pursuance of research to design, develop or propose methodologies, both of academic and applied nature, in the area of mathematical and applied control systems.
- PSO 4: Ability to use the techniques, skills and modern control engineering tools necessary for engineering practices and to take up technical/administrative challenges including the management of various projects of interdisciplinary nature, while working in a team with mutual understandings to take unsophisticated challenges leading and motivating the group to inculcate multidisciplinary and collaborative approach.

DETAILED SYLLABUS THEORY COURSES

EESA0048: POWER SYSTEM ANALYSIS (3 Credits - 45 hours) (L-T-P: 3-0-0)

Objective

The objective of this course is to give the knowledge of various methods of load flow, analysis of various types of faults in power systems, concept of security & contingency analysis of power systems and their needs for maintaining security of the system. It also introduces the concept of state estimation and the phenomenon of voltage instability in power systems.

Course Outcomes

- Find different parameters for the analysis of power system. (Remembering)
- Explain methods of state estimation in power system. (Understanding)
- Organize various contingencies according to their severity. (Applying)
- Analyse simultaneous fault using generalized method. (Analysing)
- Determine voltage magnitude and phase-angles at all buses for the given data using various methods of load flow. (Evaluating)

Module I: Load Flow (10 hours)

Overview of Newton-Raphson, Gauss-Seidel, fast-decoupled methods, convergence properties, sparsity techniques, handling Q- max violations in constant matrix, inclusion in frequency effects, AVR in load flow, handling of discrete variables in load flow.

Module II: Fault Analysis (7 hours)

Simultaneous faults, short circuit and open conductor faults, generalized method of analysis of simultaneous faults in power systems.

Module III: Security Analysis (7 hours)

Security state diagram, contingency analysis, generator shift distribution factors, line outage distribution factor, multiple line outages, overload index ranking.

Module IV: Power System Equivalents (5 hours)

WARD equivalents (Kron reduction), WARD equivalent circuits for power flow studies, REI equivalents for power systems.

Module V: State Estimation (8 hours)

Sources of errors in measurement, Virtual and Pseudo, Measurement, Observability, Tracking state estimation, WSL method, bad data correction.

Module VI: Voltage Stability (8 hours)

Introduction to voltage instability scenario in a single machine infinite bus system, Voltage collapse, P-V curve, multiple power flow solution, continuation power flow, optimal multiplies load flow.
